SELECTED WATER RESOURCES ABSTRACTS

VOLUME 7, NUMBER 13
JULY 1, 1974

W74-06501 -- W74-07050

LIBRARY OF THE UNIVERSITY OF ILLINOIS

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $45 (domestic), $56.25 (foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

LIBRARY OF THE INDIAN CHAUDHARY

VOLUME 7, NUMBER 13
JULY 1, 1974

W74-06501 -- W74-07050

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

HYDROGEOMORPHOLOGY,
Technische Hochschule, Vienna (Austria). Institut fuer Geophysik.
A. E. Scheidegger.
Journal of Hydrology, Vol 20, No 3, p 193-215, November 1973. 4 fig, 75 ref.

Descriptors: *Geomorphology, *Reviews, *Erosion, Stream erosion, Degradation(Slope), *Hydrogeology, Degradation(Stream), Earthquakes, Seepage, Landslides, Slope stability, Pore water, Karst, Subsidence, Consolidation, Beach erosion, Sea level, Tsunamis, Turbidity currents.
Identifiers: *Hydrogeomorphology.

The current state of knowledge of the mechanical effects caused by water on the morphology of the Earth is reviewed. The mechanical interaction of surface water and groundwater with landscapes and the mechanical effects of the sea on coastal regions and on the ocean bottom are discussed. (Knapp-USGS)
W74-06891

ASSESSING SYSTEMATIC ERRORS IN RAINFALL-RUNOFF MODELS,
Snowy Mountains Engineering Corp., Cooma (Australia).
A. P. Aitken.
Journal of Hydrology, Vol 20, No 2, p 121-136, October 1973. 3 fig, 5 tab, 9 ref.

Descriptors: *Rainfall-runoff relationships, *Mathematical models, *Statistical methods, Correlation analysis.
Identifiers: *Error analysis.

The errors in estimated monthly flows from seven deterministic rainfall-runoff models were studied using results published in the literature. Various commonly used statistical tests were examined, but they did not disclose systematic errors which, by the application of other tests, were often found to exist. It was therefore concluded that hydrologists should test their results by applying a simple sign test and a measure of the reproduction of the residual mass curve referred to as the residual mass curve coefficient. AUTOMATIC PROCESSING AND VERIFICATION OF METEOROLOGICAL OBSERVATIONS.
Hydrometeorological Service of the USSR, Moscow.
Available from the National Technical Information Service as TT-72 50087, $3.75 in paper copy $1.45 in microfiche. Proceedings of the International Symposium of Hydrometeorologists from the Socialist Countries, 1971. 77 p. Translated from Russian, Jerusalem, Israel. Program for Scientific Translations Technical Translation. TT-72-50087, 1973.

Descriptors: *Data processing, Hydrologic data, *Climatic data, *Meteorological data, Computer programs, Data collections, Quality control, *Automatic control.
Identifiers: *USSR.

The Moscow symposium is the first international conference devoted to the automatic control of climatological data. As a result of work undertaken by the WMO, this problem was first discussed at an international symposium on climatological data processing, held in 1968 at Asheville (USA). Climatologists have turned their attention to the problem only in recent years, when computers were used to solve climatological problems. (See W74-06723 thru W74-06733).
W74-06722

MACHINE CONTROL OF THE QUALITY OF OBSERVATIONS IN AUTOMATED HYDROMETEOROLOGICAL-DATA PROCESSING,
N. K. Klyukin.
In: Automatic Processing and Verification of Meteorological Observations; Proceedings of the International Symposium of Hydrometeorologists from the Socialist Countries: Jerusalem, Israel Program for Scientific Translations Technical Translation TT-72 50087, p 1-3, 1973. 1 fig.

Descriptors: *Data processing, *Hydrologic data, *Quality control, Data collections, *Meteorological data, Computer programs.
Identifiers: USSR.

In an automated data processing system quality control should be implemented at the beginning of the technological process, after a sufficient amount of data have been received. In most cases doubtful data detected by the computer will have to be analyzed by specialists, insuring to some extent that subsequent processing stages will employ only reliable data. Until objective computer-based control methods are fully developed and assimilated it will be necessary to control the quality of key data at subsequent processing stages, particularly when conducting statistical investigations. (See also W74-06722) (Knapp-USGS)
W74-06723

FUNDAMENTALS OF AUTOMATIC CONTROL OF METEOROLOGICAL DATA,
V. V. Filippov.
In: Automatic Processing and Verification of Meteorological Observations; Proceedings of the International Symposium of Hydrometeorologists from the Socialist Countries: Jerusalem, Israel Program for Scientific Translations Technical Translation TT-72 50087, p 4-11, 1973.

Descriptors: *Data processing, *Hydrologic data, *Quality control, Data collections, *Meteorological data, Computer programs, *Automatic control.
Identifiers: USSR, *Errors.

Computer control of the quality of meteorological data is implemented by means of programs which compare observed values of meteorological elements with independent estimates. The quality of information is estimated by the measure of the admissible discrepancy between the observed values and their independent estimates determined numerically or by means of other measurement techniques. The ideal program must satisfy the following basic conditions: (1) all observed parameters must be checked with the same degree of reliability; (2) control must be absolute, i.e., discovery of all errors independently of their size and origin; and (3) automatic control must be more thorough and cheaper than manual control. Besides their immediate value, the results of quality control can be very useful in the inspection of a meteorological network. (See also W74-06722) (Knapp-USGS)
W74-06724

AUTOMATIC CHECK AND CORRECTION OF METEOROLOGICAL DATA IN EAST GERMANY,
H. Kase, and B. Antonik.
In: Automatic Processing and Verification of Meteorological Observations; Proceedings of the International Symposium of Hydrometeorologists from the Socialist Countries: Jerusalem, Israel Program for Scientific Translations Technical Translation TT-72 50087, p 12-19, 1973. 2 fig, 4 ref.

Descriptors: *Data processing, *Hydrologic data, *Quality control, Data collections, *Meteorological data, Computer programs, Automatic control.
Identifiers: *Germany.

Meteorological information is collected and processed in accordance with specific instructions and programs. Such repetitive processes are very convenient for automation. The data control and correction subsystem used in East Germany is described. The following meteorological quantities are measured by the automatic remote-control meteorological station: mean wind speed (integration time 10 minutes); maximum wind speed (integration time 1.5 sec); average wind direction (integration time 10 minutes); total rainfall; rain duration; number of lightning discharges in a 15-km radius; global radiation; air temperature; soil temperature at depths of 5, 10, 20, and 50 cm; air pressure; dew point; and psychrometric difference. In computer control by means of logi-

cal relations, data contained in the meteorological journal serve as initial data. The check is based on specified limiting values or combinations determined by observations. The control input parameters are air temperature, water vapor content in air, air pressure, horizontal visibility at ground level, cloudiness, soil state, weather state, and wind. (See also W74-06722) (Knapp-USGS)
W74-06725

COMPUTER MONITORING OF PRECIPITATION IN HUNGARY,
L. Adami.
In: Automatic Processing and Verification of Meteorological Observations; Proceedings of the International Symposium of Hydrometeorologists from the Socialist Counties: Jerusalem, Israel Program for Scientific Translations Technical Translation TT-72 50087, p 20-21. 1973.

Descriptors: *Data processing, *Hydrologic data, *Quality control, Data collections, *Meteorological data, Computer programs, *Climatic data, Monitoring, Precipitation(Atmospheric).
Identifiers: *Hungary.

The rainfall data supplied by the comparatively dense network of stations covering the territory of Hungary are controlled daily and processed manually, and precipitation charts are prepared. This processing is time- and labor-consuming: each month it is necessary to copy and calculate about 40 million items of data, and at times to recalculate them. Accordingly, the data processing section of the Hungarian Meteorological Service has been conducting numerical experiments in computer control and processing of daily precipitation data since November 1966. The computer not only implements control, but also plots daily precipitation charts and prepares tables containing the results of statistical processings. The output includes the following data: checked sum of daily and monthly precipitation for each station; deviations from the norms; chart of distribution of precipitation by days and months; days with given sums of precipitation; days with snow and with storms and hail; and yearly conclusions. (See also W74-06722) (Knapp-USGS)
W74-06726

AUTOMATIC MONITORING OF DAILY RESULTS OF BASIC METEOROLOGICAL OBSERVATIONS,
I. V. Nazarova.
In: Automatic Processing and Verification of Meteorological Observations; Proceedings of the International Symposium of Hydrometeorologists from the Socialist Countries Jerusalem, Israel Program for Scientific Translation Technical Translation TT-72 50087, p 22-30, 1973. 3 fig, 5 tab.

Descriptors: *Data processing, *Hydrologic data, *Quality control, Data collections, *Meteorological data, Computer programs, *Automatic control, Climatic data, Monitoring.
Identifiers: *USSR.

Methods were developed in the USSR for automatically monitoring basic meteorological observations: air temperature (periodical, maximum, minimum), soil surface temperature (periodical, maximum, minimum), atmospheric humidity, dew point, atmospheric pressure, wind direction and speed, aurora duration, snow cover, precipitation, amount the form of clouds, atmospheric effects, visibility, weather and soil surface state. Random errors are found by examining the daily data. Methods of detecting random errors and coarse blunders are discussed. Each observed quantity is first compared with the boundaries of climatic limits and the codes. If these conditions are not fulfilled, the given quantity is no longer controlled, and the computer prints the number of the error which is analyzed and corrected by specialists. If the conditions are fulfilled, a more accurate control, different for the various meteorological elements, is conducted. (See also W74-06722) (Knapp-USGS)
W74-06727

AUTOMATIC METHOD OF MONITORING THE QUALITY OF MEAN MONTHLY METEOROLOGICAL DATA,
D. P. Bespalov, and I. A. Berlin.
In: Automatic Processing and Verification of Meteorological Observations; Proceedings of the International Symposium of Hydrometeorologists from the Socialist Countries: Jerusalem, Israel Program for Scientific Translations Technical Translation TT-72 50087, p 31-35, 1973. 1 tab.

Descriptors: *Data processing, *Hydrologic data, *Quality control, Data collections, *Meteorological data, Computer programs, *Automatic control, Monitoring.
Identifiers: *USSR.

In the automated monitoring of data at the USSR Hydrometeorological Service, all meteorological data to be recorded on a carrier for later utilization pass necessarily through two control stages. The first stage involves examination of coarse errors (miscalculations and distortions) in routine data, which were caused mainly by data distortion in the communication lines, and also during punching and data decoding. In the second stage the results are analyzed for uniformity and compatibility and searched for systematic errors. This stage represents quality analysis of the observation results. Random errors, technical miscalculations, and distortions in the communication channels are usually detected fairly simply by a careful examination of the observation results, and are either corrected or eliminated from subsequent use while preparing the results for monthly generalizations. (See also W74-06722) (Knapp-USGS)
W74-06728

AUTOMATIC MONITORING OF PROCESSING OF DAILY RADIOSONDE DATA ON TEMPERATURE AND GEOPOTENTIAL,
I. V. Khanevskaya.
In: Automatic Processing and Verification of Meteorological Observations; Proceedings of the International Symposium of Hydrometeorologists from the Socialist Countries: Jerusalem, Israel Program for Scientific Translations Technical Translation TT-72-50087, p 36-49, 1973, 2 fig, 4 tab, 7 ref.

Descriptors: *Data processing, *Hydrologic data, *Quality control, Data collections, *Meteorological data, Computer programs, *Automatic control, Monitoring, *Radiosondes, Temperature.
Identifiers: *USSR.

At present the Hydrometeorological Service of the USSR implements a scheme of automatic processing of daily aerological observations. Aerological observations, punched on paper tape, are received during the first days of each following month at the Regional Centers. The results are read into the computer, decoded, and formed into a matrix. Control and correction of erroneous values of the elements in the matrices are followed by calculation of the required overall monthly characteristics with printout of daily and overall data and their recording on a permanent carrier. (See also W74-06722) (Knapp-USGS)
W74-06729

AUTOMATIC MONITORING AND PROCESSING OF HOURLY HYDROMETEOROLOGICAL INFORMATION,
Z. M. Makhover, and V. V. Ovsyannikov.
In: Automatic Processing and Verification of Meteorological Observations; Proceedings of the International Symposium of Hydrometeorologists from the Socialist Countries Jerusalem Israel Program for Scientific Translations Technical Translation TT-72 50087, p 50-58, 1973. 4 fig, 4 tab, 3 ref.

Descriptors: *Data processing, *Hydrologic data, *Quality control, Data collections, *Meteorological data, Computer programs, *Automatic control, Monitoring
Identifiers: *USSR

Hourly meteorological observations are conducted at the meteorological stations of airports in the USSR for operational purposes and cover the main characteristics necessary for serving aircraft. These observations are also of great scientific value since they yield the most detailed time structure of the series of observations. The computer system for automatic control and processing of hourly meteorological information includes the following main stages: Punching of observation results on teleprinter tape, which is then forwarded monthly to the Regional Center for processing; input of the punched tape into a computer, which processes and monitors the data; and output of tables of hourly observations, summary tables, and data recording on microfilm for lengthy storage. About 45-50 minutes machine time are taken for monitoring and processing of the monthly file of hourly data of a given station; when microfilming is included in the process this time increases to 1.5 hr. The following advantages are achieved by the automation of monitoring and processing: no manual labor is needed for filling and checking tables; monitored and processed data are obtained, including summary data; monitored data are recorded on a permanent medium (microfilm); the time taken for processing and recording data on the permanent medium is reduced considerably; considerable savings are achieved. This system was tested at the Belorussian Territorial Center and the Western Siberian Regional Center and was found viable and easy to operate. (See also W74-06722) (Knapp-USGS)
W74-06730

SOME PRINCIPLES OF OBJECTIVE CONTROL OF MARINE METEOROLOGICAL INFORMATION,
B. A. Birman, and A. S. Kaganskii.
In: Automatic Processing and Verification of Meteorological Observations: Proceedings of the International Symposium of Hydrometeorologists from the Socialist Countries: Jerusalem, Israel Program for Scientific Translations Technical Translation TT-72 50087, p 59-61, 1973. 1 ref.

Descriptors: *Data processing, *Hydrologic data, *Quality control, Data collections, *Meteorological data, Computer programs, *Marine air masses.
Identifiers: *USSR.

Marine meteorological observations, unlike other standard meteorological observations, are irregular with the exception of data originating from a small number of weather ships and lighthouses. Marine meteorological information is received at the Center of Statistical Data Processing and Storage of the USSR in the form of synoptic telegrams and observer's logs, and is processed and controlled automatically. Due to the irregularity of marine meteorological observations, spatial control is best implemented according to some quasi-homogeneous regions within which differences between the meteorological elements are of a random nature. A study conducted for the Gulf Stream convergence zone and the Labrador currents established that in a square of 10 deg X 10 deg a fully homogeneous air temperature field was recorded in 12% of cases, and in a square 5 deg X 5 deg in 26% of cases. The air mass propagating over a 2 deg X 2 deg square was in 50% of cases fully temperature-homogeneous in the marine surface layer, while in a 1 deg X 1 deg square this was true in 70 cases out of 100. Analysis of the homogeneity of the air temperature field on the basis of long-

term data established that a 2 deg X 5 deg area forms a quasi-homogeneous water area in this part of the Atlantic Ocean. (See also W74-06722) (Knapp-USGS)
W74-06731

AUTOMATIC PROCESSING OF RAINFALL DATA,
R. L. Kagan, and A. I. Polishchuk.
In: Automatic Processing and Verification of Meteorological Observations; Proceedings of the International Symposium of Hydrometeorologists from the Socialist Countries: Jerusalem, Israel Program for Scientific Translations Technical Translation TT-72-50087, p 62-68, 1973. 2 fig, 12 ref.

Descriptors: *Data processing, *Hydrologic data, *Quality control, Data collections, Meteorological data, Computer programs, *Weather data, Climatic data, *Rainfall, *Automatic control.
Identifiers: *USSR.

Systematic errors in meteorological data may be found with sufficient reliability by spatial interpolation. However, there are meteorological elements, such as the amount of rainfall, for which the results are less satisfactory. Control of meteorological data by spatial interpolation/may be reduced to the determination of the discrepancy between the observed value of the element and that obtained by interpolation from data of the surrounding stations. If this discrepancy exceeds some specified value, the observation is considered doubtful. This specified value must be much higher than the discrepancies caused by the natural spatial variability in error-free observations. For the monthly precipitation sums the mean square discrepancy of the interpolation is near to the tolerance adopted at present, and as a result roughly one-third of the data lie beyond its limits. Thus, for the monthly rainfall over the territory of the central regions of European USSR it represents 32% of the mean value. Similar results were also obtained for the territory of Belorussia. The density of the rainfall-measuring network in the Soviet Union is not uniform, but a density of 1 station per 2,000 sq km can be considered near its average density over the whole territory. (See also W74-06722) (Knapp-USGS)
W74-06732

AN ALGORITHM FOR MONITORING HYDROMETEOROLOGICAL INFORMATION,
I. A. Dyubkin.
In: Automatic Processing and Verification of Meteorological Observations; Proceedings of the International Symposium of Hydrometeorologists from the Socialist Countries: Jerusalem, Israel Program for Scientific Translations Technical Translation TT-72 50087, p 69-75, 1973. 1 tab, 10 ref.

Descriptors: *Data processing, *Hydrologic data, *Quality control, Data collections, *Meteorological data, Computer programs, *Algorithms, Monitoring.
Identifiers: *USSR.

Studies on the automation of all stages of hydrometeorological data flow, starting with the observations and ending with the delivery of data to the customer, are conducted at the Hydrometeorological Service of the USSR. One component of the automation system is data control, the correction or rejection of erroneous data. The most widely used methods of automatic control are static methods, based on the barometric height formula, and optimal interpolation, involving data on the statistical structure of analyzed hydrometeorological elements. This method is quite efficient in regions with a dense network of stations. One shortcoming of this objective control of observational results is the subjectivity in selecting the critical discrepancy between observed and controlled values. One possible algorithm for finding coarse observation errors in related hydrometeorological series is based on the mathematical-statistical principle of the impossibility of implementing a phenomenon with a small occurrence probability in a single test. The statistical structure of the observed quantities and their derivatives is examined. The diurnal and seasonal cycle is eliminated. The quasi-steady averaging periods and the locally-homogeneous regions are determined. The control algorithms are constructed allowing for the characteristics of the variability of the analyzed element by seasons and regions. The suggested control algorithms for hydrometeorological elements were constructed with allowance for data on the natural variability of the analyzed parameters and are applicable to a sparse network of nonuniformly distributed stations. (See also W74-06722) (Knapp-USGS)
W74-06733

ANALYSIS OF THE CONCENTRATION OF MICROPARTICLES IN THE LONG ICE CORE FROM BYRD STATION,
Ohio State Univ., Research Foundation, Columbus. Inst. of Polar Studies.
For primary bibliographic entry see Field 2C.
W74-06931

UNIVERSITY OF CHICAGO CONTRIBUTION TO PROJECT METROMEX-I.
Chicago Univ., Ill. Dept. of the Geophysical Sciences.
Available from NTIS, Springfield, Va. 22151 as PB-218 678; $3.00 printed copy, $1.45 microfiche. Cloud Physics Laboratory Technical Note 45 (Final technical report to the National Science Foundation), R. R. Braham, Jr., editor, December 15, 1972. 101 p. NSF Grant GA 28190X1.

Descriptors: *Cities, *Precipitation(Atmospheric), *Weather modification, *Chemistry of precipitation, Aerosols, Urban hydrology, Nucleation, *Missouri.
Identifiers: Urban precipitation anomaly, *St. Louis(Mo).

Measurements made over and around St. Louis, Missouri show that the city markedly affects several atmospheric parameters important in the formation of clouds and weather. The city acts as a source of cloud condensation nuclei (CCN) with a source strength of 5000 to 50,000 per cc per sec. This increase in CCN concentrations results in downwind clouds with smaller, more numerous drops at cloud base. Vertical cross-sections of state parameters and aerosol were used to study the vertical structure of the urban heat island and urban aerosol plume. Radar mapping of precipitation echoes verifies the presence of an urban precipitation anomaly. (See W74-06938 thru W74-06941) (Knapp-USGS)
W74-06937

RADAR STUDIES OF URBAN PRECIPITATION ANOMALY,
Chicago Univ., Ill. Dept. of the Geophysical Sciences.
M. Dungey, and T. R. Morris.
In: University of Chicago Contribution to Project Metromex-I: Chicago University Cloud Physics Laboratory Technical Note 45 (Final technical report to the National Science Foundation), p 25-33, December 15, 1972. 4 fig, 3 tab.

Descriptors: *Cities, *Precipitation(Atmospheric), *Weather modification, *Chemistry of precipitation, Aerosols, Urban hydrology, Nucleation, *Missouri, *Remote sensing, Radar.
Identifiers: Urban precipitation anomaly, *St. Louis(Mo).

Radar data show that precipitation initiation in the St. Louis are during June-August 1972 was predominantly through drop coalescence. The area over and downwind of the city had about 2.4 times the frequency of precipitation initiation of the non-city area. A larger fraction of the city echoes grew after formation. On the average the First Echo (FE) base and top heights were about equal over the city and non-city, although the cumulative frequency distribution show a skewing toward higher bases and tops for city FE. The frequency of no-echo observations is about three times higher over the city than over the non-city. This fact combined with more frequent FE formation suggests that a combination of two urban agents is at work--one of which increases the likelihood of precipitation formation over the downwind of the city, and a second reduces the total area over which precipitation reaches the ground. (See also W74-06937) (Knapp-USGS)
W74-06938

OBSERVATIONS OF THE CLOUD NUCLEUS CONCENTRATION AROUND THE ST. LOUIS URBAN COMPLEX,
Chicago Univ., Ill. Dept. of the Geophysical Sciences.
P. Spyers-Duran.
In: University of Chicago Contribution to Project Metromex-I: Chicago University Cloud Physics Laboratory Technical Note 45 (Final technical report to the National Science Foundation), p 35-52, December 15, 1972. 10 fig, 2 tab, 16 ref. NSF Grant GA 28190X1.

Descriptors: *Cities, *Precipitation(Atmospheric), *Weather modification, *Chemistry of precipitation, Aerosols, Urban hydrology, Nucleation, *Missouri.
Identifiers: Urban precipitation anomaly, *St. Louis(Mo).

In summer 1971, winter 1972, and summer 1972, a highly industrialized and populated area (St. Louis) produces cloud condensation nuclei (CCN) significantly above background concentrations. Downwind, the CCN plume is identifiable for at least one diameter of the urban area. Maximum concentrations typically were found immediately downwind; a secondary maximum might exist 30-35 miles downwind of the city. The production rates of CCN are similar to those of other cities including Denver and Buffalo, and lower production rates exist on Sundays. (See also W74-06937) (Knapp-USGS)

UPWIND AND DOWNWIND CLOUD-BASE MICROSTRUCTURE,
Chicago Univ., Ill. Dept. of the Geophysical Sciences.
P. Spyers-Duran.
In: University of Chicago Contribution to Project Metromex-I: Chicago University Cloud Physics Laboratory Technical Note 45 (Final technical report to the National Science Foundation), p 53-71, December 15, 1972. 15 fig, 3 tab, 11 ref. NSF Grant GA 28190X1.

Descriptors: *Cities, *Precipitation(Atmospheric), *Weather modification, *Chemistry of precipitation, Aerosols, Urban hydrology, Nucleation, *Missouri.
Identifiers: Urban precipitation anomaly, *St. Louis(Mo).

Cloud base microstructure is controlled to a large extent by the updraft speed and the subcloud condensation nuclei (CCN) spectra. Clouds forming in high CCN concentrations form a narrow spectra of small drops compared with those forming from low CCN concentrations. The ability of clouds to produce precipitation through coalescence is related to their cloud drop spectra. In general the initial 'breakout' of precipitation elements is delayed in narrow spectrum clouds. Because St. Loius typically serves as a source of CCN, the microstructure of clouds around the city was studied to verify that they show response to the urban-induced cloud condensation nuclei. Over the city and

downwind, clouds are composed of smaller and more numerous droplets and have smaller dispersion than the upwind clouds. This increase in continentality of the microstructure in the effected clouds results in colloidal stability and hence could lower the probability of producing precipitation. Downwind clouds, in about a distance of the city diameter, approach again the upwind cloud microstructure. (See also W74-06937) (Knapp-USGS)
W74-06940

METROMEX TEMPERATURE AND AEROSOL DATA REDUCTION: ANALYSIS OF THE URBAN ANOMALY,
Chicago Univ., Ill. Dept. of the Geophysical Sciences.
H. E. Dytch.
In: University of Chicago Contribution to Project Metromex-I: Chicago University Cloud Physics Laboratory Technical Note 45 (Final technical report to the National Science Foundation), p 73-90, December 15, 1972. 12 fig. NSF Grant GA 28190XI.

Descriptors: *Cities, *Precipitation(Atmospheric), *Weather modification, *Chemistry of precipitation, Aerosols, Urban hydrology, Nucleation, *Missouri.
Identifiers: Urban precipitation anomaly, *St. Louis(Mo).

Flights over the St. Louis area were designed to study in detail the influence of an urban center upon its meteorological environment, continuously measuring state parameters and aerosol distribution in vertical cross-sections at selected flight levels over the city. Infrared surface temperature measurements were also conducted during the winter of 1972, mapping in detail an approximately 2,500 sq km region centered on the St. Louis metropolitan area. A high temperature pocket, centered on downtown St. Louis just west of the Gateway Arch stands out clearly, with a maximum temperature difference from the outlying northern rural area in excess of 5 deg C. Topographical effects, associated possibly with cold-air drainage, also are evident but close to the city the temperature field appears to be dominated by the urban effect. In terms of both particle concentration and density the urban area appears as a strong source of contamination, and the confining effect of the upper level inversion is marked. (See also W74-06937) (Knapp-USGS)

THE ROLE OF DEW IN THE SEASONAL MOISTURE BALANCE OF A SUMMER-DRY CLIMATE,
Victoria Univ. (British Columbia). Dept. of Geography.
S. E. Tuller, and R. Chilton.
Agric Meteorol. Vol 11, No 1, p 135-142. 1973.
Identifiers: *Dew, *Dry climates, Evapotranspiration, *Moisture balance, Seasonal, Summer, Transpiration.

The role of dew in the moisture balance of a summer-dry climate was investigated. Dew was measured by means of the optical technique employing Duvdevani dew blocks during 3 summer months and one fall month in 1970. Results were compared with rainfall and potential evapotranspiration. Dew amounted to 12-14% of normal monthly rainfall in mid-summer. In the unusually dry year of 1970 it reached 154% of the rainfall in Aug. Dew was seen to increase with the number of clear nights and thus, increased as clouds and precipitation decreased. Although dew was an available source of evaporative moisture until approximately 09h30 on the morning after a clear night, its total was only about 2% of monthly potential evapotranspiration. The amount of dew increased outward from a vertical forest edge as longwave cooling and wind effects increased.--Copyright 1973, Biological Abstracts, Inc.

ENERGY FLOWS IN THE BIOSPHERE: THE IMPACT OF MAN,
Australian National Univ., Canberra. Research School of Biological Sciences.
R. O. Slatyer.
Proc Linn Soc N S W. Vol 97, No 3, p 225-236. 1972.
Identifiers: *Biosphere, Climates, Cycling, Electric power, *Energy flows, Food, Insulation, Photosynthesis, Planned obsolescence, Power production, Solar energy, *Ecosystems, *Energy balance.

The way in which energy underlies the workings of the biosphere, the workings of the natural ecosystems and the workings of human societies is discussed. Solar energy is of fundamental importance to the global environment, and the patterns of weather and climate reflect a delicate balance between the inflows, outflows and redistributions. National ecosystems are powered by solar energy through photosynthesis, and there is a tendency for their energy storage and species diversity to increase with succession. Human activity is linked to energy consumption, and the tendency is to use more and more energy per person. Any significant change in the energy balance is likely to affect the climate, and small effects on climate could have serious effects on food production. The challenge for the future is to produce and use energy as efficiently as possible, and with the least possible ecological disturbance. Some possible methods to do this include: recycling, extensive use of hydro-electric power, better insulation in structures and a change of the Western life style with its emphasis of endless production and planned obsolescence.--Copyright 1973, Biological Abstracts, Inc.

DRY AND WET, JULY-AUGUST RAINFALL AREAS IN IOWA,
Iowa State Univ., Ames. Dept. of Agronomy.
R. H. Shaw, and P. J. Waite.
Iowa State J Res. Vol 47, No 3, p 191-198. 1973. Illus.
Identifiers: Clouds, *Crop production, Dry season, *Iowa, *Rainfall, Seeding, Wet season.

July and Aug. rainfalls in Iowa, coinciding with the peak of heating and evapotranspiration, are especially critical for crop production. Consequently, areal and temporal evaluations of the characteristics of rainfall in Iowa during those months in 1931-1970 was undertaken to provide a climatological analysis for the potential effects of cloud seeding on crop production. Dry areas during July-Aug. in Iowa were observed in 27 of 40 yr (i.e., 2 of 3) and wet areas were observed in 35 of 40 yr (7 of 8); both wet and dry areas were present in more than half the years (22 of 40). Iowa does not experience an increased number of low-rainfall days during dry spells, but experience an actual decreased number of rain days at all rainfall threshold values of 0.01, 0.1, 0.25 and 0.5 in.--Copyright 1973, Biological Abstracts, Inc.

NEW INSIGHTS INTO THE INFLUENCE OF ICE ON THE COASTAL MARINE ENVIRONMENT OF THE BEAUFORT SEA, ALASKA,
Geological Survey, Menlo Park, Calif. Office of Marine Geology and Hydrology.
P. W. Barnes, and E. Reimnitz.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1307-1314, 1973. 5 fig, 11 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Sea ice, *Alaska, *Geomorphology, Surveys, Data collections, Water circulation, Sedimentation, Sediment transport
Identifiers: *ERTS

Areal patterns from field data and ERTS 1 imagery show a close relationship between geomorphic processes and the influence of sea ice along Alaska's northern coast, perhaps the nation's least known continental margin. Ice acts as (1) a bottom-gouging agent, (2) an influence on water circulation, (3) a carrier of sediments, and (4) an influence on water types. (See also W74-06619) (Knapp-USGS)
W74-06669

USE OF ERTS DATA FOR MAPPING ARCTIC SEA ICE,
Environmental Research and Technology, Inc., Lexington, Mass.
J. C. Barnes, and C. J. Bowley.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1377-1384, 1973. 7 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Sea ice, *Mapping, Surveys, Monitoring, Data collections, Icebergs, Ice, Arctic, Glaciers, Snowpacks.
Identifiers: *ERTS.

ERTS data were evaluated for detecting and mapping Arctic sea ice. The specific objectives are to determine the spectral bands most suitable for detecting ice, to measure the scale and types of ice features that can be detected, and to develop interpretive techniques for differentiating ice from clouds and for mapping ice concentrations. Sea ice is detectable in all of the ERTS MSS spectral bands and can be distinguished from clouds through a number of interpretive keys. The MSS-4 (0.5 to 0.6 micron) and MSS-5 (0.6 to 0.7 micron) bands appear to be better for mapping ice boundaries, whereas the MSS-7 (0.8 to 1.1 micron) band provides greater detail in the ice features. Considerable information on ice type can be derived from the ERTS data. Ice types that appear to be identifiable include: ice flows of various categories, pack ice of various concentrations, ice belts, brash ice, rotten ice, fast ice, leads, fractures, cracks, puddles, thaw holes and flooded ice. The multispectral analysis of the ERTS MSS-4 and MSS-7 bands provides much information on ice type and ice surface features that cannot be derived from a single spectral band. For example, thaw holes can often be distinguished from puddles because of their different appearances in the two bands. These surface features can be indicative of ice age. Furthermore, snow lines on glaciers can be reliably mapped through the joint use of the MSS-4 and MSS-7 data. (See also W74-06619) (Knapp-USGS)

SNOW COVER SURVEYS IN ALASKA FROM ERTS-1 DATA,
Alaska Univ., College.
C. S. Benson.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1593-1595, 1973.

Descriptors: *Remote sensing, Satellites(Artificial), *Snow cover, *Ice, *Glaciers, Snowpacks, *Alaska, Surveys, Melting, Mapping, Data collections.
Identifiers: *ERTS.

September and October, 1972, ERTS data were analyzed to delineate snow cover patterns in northern Alaska's Brooks Range and on Mt. Wrangell, an active volcano in south central Alaska. Snow on the northern foothills of the Brooks Range is significantly more affected by katabatic wind action than on the southern foothills. Aufeis deposits along artic rivers also can be identified in late summer. A survey of such aufeis deposits could identify additional summertime sources of freshwater supplies. Images of Mt. Wrangell monitor the interaction between volcanic heat and the mass balance of glaciers. Significant melting of new snow from an extensive storm on August 18 was seen. Digital analysis of data from subsequent passes over the summit on September 7, 23 and 24 reveal considerable bare rock exposed by melting, which is virtually impossible from solar heating at this altitude and date. RECENT ACTIVITY OF GLACIERS OF MOUNT RAINIER, WASHINGTON,
Geological Survey, Reston, Va.
R. S. Sigafoos, and E. L. Hendricks.
Available from Sup Doc, GPO, Washington, D C 20402, Price $5.70. Geological Survey Professional Paper 387-B, 1972. 24 p, 13 fig, 7 plate, 10 tab, 21 ref.

Descriptors: *Glaciers, *Washington, *Dendrochronology, *Paleoclimatology, Glacial drift, Quaternary period, Pleistocene epoch, Dating, Glacial sediments, Geomorphology.
Identifiers: *Mount Rainier(Wash).

Moraines on Mt. Rainer, Washington, can be dated by knowing the ages of trees. Knowing past glacial activity aids understanding of past climatic variations. There are modern moraines of different age around the mountain; some valleys contain only one modern moraine; others contain as many as nine. The evidence indicates a sequence of modern glacial advances terminating at about the following A.D. dates: 1525, 1550, 1625-60, 1715, 1730-65, 1820-60, 1875, and 1910. Nisqually River valley near Nisqually Glacier contains one moraine formed before A.D. 1842; Tahoma Creek valley near South Tahoma Glacier contains three moraines formed before A.D. 1528, 1843, and 1864; South Puyallup River valley near Tahoma Glacier, six moraines, A.D. 1544, 1761, 1841, 1851, 1863, 1898; Puyallup Glacier, one moraine, A.D. 1846; Carbon Glacier, four moraines, 1519, 1763, 1847, 1876; Winthrop Glacier, four moraines, 1655, 1716, 1760, and 1822; Emmons Glacier, nine moraines, 1596, 1613, 1661, 1738, 1825, 1850, 1865, 1870, 1901; and Ohanapecosh Glacier, three moraines, 1741, 1846, and 1878. Outwash in three areas was deposited by melt-water of Tahoma Glacier before A.D. 1862, 1873, and 1910, respectively. Flood channels or melt-water channels on either side of Carbon River near Carbon Glacier dated from about 1901 to 1907. Melt-water channels of three different ages cut through Emmons Glacier moraines were dated as being abandoned before 1865, 1871, and 1917, respectively. (Knapp-USGS)

INVESTIGATIONS PERFORMED ON THE ARCTIC ICE DYNAMICS JOINT EXPERIMENT, MARCH 1971,
Cold Regions Research and Engineering Lab., Hanover, N.H.
S. F. Ackley, W. D. Hibler, III, A. Kovacs, W. F. Weeks, and A. Hartwell.
Research Report 315, December 1973. 66 p.

Descriptors: *Sea ice, *Ice cover, *Cryology, Deformation, Topography, Strain, Stress, Movement, Winds, Currents(Water), Plastic deformation, Aerial photography.
Identifiers: *Pack ice, *Beaufort Sea, Ice dynamics.

Mesoscale strain measurements were made on the Beaufort Sea pack ice. Fracture (lead and crack) orientations in first-year ice indicate correlation with the orientation of the strain rate ellipse. A qualitative relation is suggested between the fracture density and the long-term divergence rate. Correlation was also observed between the divergence of the wind field, as computed from the surface pressure field, and the ice divergence. Three transverse profiles were measured across a large pressure ridge in the Beaufort Sea. The ridge sail extended 4 m above sea level and the keel 13 m below. The cross sections of the keel were roughly semicircular, suggesting that form drag coefficients for flow transverse to the long axes of multiyear ridges may be as high as 0.8. A spectral study of the snow and ice topography of a multiyear floe showed that the snow cover attenuates the roughness amplitude of the ice surface but does not cover it completely. The ice sheet as a whole is in free-floating, isostatic equilibrium, but pronounced local deviations from isostatic equilibrium are common. The time, direction and magnitude of deformational motion in the Beaufort Sea were determined by combining observations of the changes in features related to ice deformation (leads, fractures, pressure ridges) with mesoscale measurements of strains and strain rates on the ice. Measurements of the size of ice blocks in newly formed pressure ridges and measurements of salinity and temperature are presented. (See W74-06717 thru W74-06721) (Knapp-USGS)
W74-06716

MESOSCALE STRAIN MEASUREMENTS ON THE BEAUFORT SEA PACK ICE,
Cold Regions Research and Engineering Lab., Hanover, N.H.
W. D. Hibler, III, W. F. Weeks, S. Ackley, A. Kovacs, and W. J. Campbell.
In: Investigations Performed on the Arctic Ice Dynamics Joint Experiment, March 1971: Army Cold Regions Research and Engineering Laboratory Research Report 315, Part 1, p 3-22, December 1973. 12 fig, 2 tab, 21 ref.

Descriptors: *Sea ice, *Ice cover, *Cryology, Deformation, Topography, Strain, Stress, Movement, Winds, Currents(Water), Plastic deformation, Aerial photography.
Identifiers: *Pack ice, *Beaufort Sea, Ice dynamics.

The deformation of a strain triangle approximately 6 x 8 x 11 km located on first-year ice in the Beaufort Sea was observed over a 2-week period in March 1971. Significant strain events were observed during short (6-hour) time periods. The long-term (one day or more) divergence rate varied between 0.04 and 0.00008 per hour. Short-term divergence rates showed values as high as 0.00029 per hour. The floes to the east were moving south relative to the floes to the west. This agrees with the shear pattern that might be expected, considering the location of the station in the Pacific Gyre. Studies of fracture (lead and crack) orientations in the vicinity of the strain triangle indicate reasonable correlations with the orientation of the strain rate ellipse. A qualitative relation is suggested between the fracture density and the long-term divergence rate. Correlations were also observed between the divergence of the wind field as computer from the surface pressure field and the ice divergence. (See also W74-06716) (Knapp-USGS)
W74-06717

STRUCTURE OF A MULTIYEAR PRESSURE RIDGE,
Cold Regions Research and Engineering Lab., Hanover, N.H.
A. Kovacs, W. F. Weeks, S. Ackley, and W. D. Hibler, III.
In: Investigations Performed on the Arctic Ice Dynamics Joint Experiment, March 1971: Army Cold Regions Research and Engineering Laboratory Research Report 315, Part 2, p 23-33, December 1973. 11 fig, 12 ref.

Descriptors: *Sea ice, *Ice cover, *Cryology, Deformation, Topography, Strain, Stress, Movement, Winds, Currents(Water), Plastic deformation, Aerial photography.
Identifiers: *Pack ice, *Beaufort Sea, Ice dynamics.

Three transverse profiles were measured across a large pressure ridge located in the Beaufort Sea. The ridge sail extended 4 m above sea level and the ridge keel 13 m below. The cross sections of the ridge keel are roughly semicircular, suggesting that form drag coefficients for flow transverse to the long axes of multiyear ridges may be as high as 0.8. Much of the ice in the ridge has a very low salinity and is quite strong. All the interblock voids that initially existed in the ridge at the time of its formation have been completely filled with ice. These observations, coupled with icebreaking experience, indicate that multiyear ridges are obstacles to even the largest icebreaking ship and should be avoided if possible. A very large first-year ridge with a sail height of 12.8 m is also described. This is the largest free-floating ridge yet recorded. (See also W74-06716) (Knapp-USGS)
W74-06718

TOP AND BOTTOM ROUGHNESS OF A MULTIYEAR ICE FLOE,
Cold Regions Research and Engineering Lab., Hanover, N.H.
W. D. Hibler, III, S. F. Ackley, W. F. Weeks, and A. Kovacs.
In: Investigations Performed on the Arctic Ice Dynamics Joint Experiment, March 1971: Army Cold Regions Research and Engineering Laboratory Research Report 315, Part 3, p 35-44, December 1973. 8 fig, 1 tab, 9 ref.

Descriptors: *Sea ice, *Ice cover, *Cryology, Deformation, Topography, Strain, Stress, Movement, Winds, Currents(Water), Plastic deformation, Aerial photography.
Identifiers: *Pack ice, *Beaufort Sea, Ice dynamics.

A spectral study of the snow and ice topography on a multiyear ice floe shows that the snow cover, although attenuating the roughness amplitude of the ice surface, does not cover it completely. In general the snow surface variance is lower by a factor of one-third to one-fourth than the ice surface variance. The correlation between snow and ice surface roughness is highly significant for long wavelengths (> 8 m), but fails to be significant for short wavelengths (< 4 m). Although the ice sheet as a whole is in free-floating, isostatic equilibrium, pronounced local deviations from isostatic equilibrium are common. The trend is for ice drafts to deviate more than expected from isostasy for thin ice and less than expected for thick ice. Estimates are also made of the number of ice thickness measurements required to obtain the mean thickness of the multiyear floe to any specified accuracy. (See also W74-06716) (Knapp-USGS)
W74-06719

AIRPHOTO ANALYSIS OF ICE DEFORMATION IN THE BEAUFORT SEA,
A. D. Hartwell.
In: Investigations Performed on the Arctic Sea Ice Dynamics Joint Experiment, March 1971: Army Cold Regions Research and Engineering Laboratory Research Report 315, Part 4, p 45-60, December 1973. 18 fig, 1 tab, 6 ref.

Descriptors: *Sea ice, *Ice cover, *Cryology, Deformation, Topography, Strain, Stress, Movement, Winds, Currents(Water), Plastic deformation, Aerial photography.
Identifiers: *Pack ice, *Beaufort Sea, Ice dynamics.

Ice deformation in a 175 sq km area of the Beaufort Sea was analyzed by means of sequential aerial photographs. The approximate time, direction and magnitude of deformational motion were determined by combining observations of the changes in features related to ice deformation, such as leads, fractures and pressure ridges, and mesoscale measurements of strains and strain rates on the ice. During this period a series of compressions, extensions and shearing motions occurred, producing numerous changes in ice morphology. The entire area was apparently under considerable lateral constraint with no observable rotation or rounding of floes. No leads wider than about 150 m were present. Shearing motion along one individual lead of up to 280 m was documented by the photographs. Relative motion along shear zones was nearly always dextral or right lateral in accord with the clockwise rotation of the Pacific Gyre. (See also W74-06716) (Knapp-USGS)
W74-06720

DATA ON MORPHOLOGICAL AND PHYSICAL CHARACTERISTICS OF SEA ICE IN THE BEAUFORT SEA,
Cold Regions Research and Engineering Lab., Hanover N. H.
S. F. Ackley, A. Kovacs, W. F. Weeks, and W. D. Hibler, III.
In: Investigations Performed on the Arctic Ice Dynamics Joint Experiment, March 1971: Army Cold Regions Research and Engineering Laboratory Research Report 315, Part 5, p 61-63, December 1973. 3 fig, 3 tab.

Descriptors: *Sea ice, *Ice cover, *Cryology, Deformation, Topography, Strain, Stress, Movement, Winds, Currents(Water), Plastic deformation, Aerial photography.
Identifiers: *Pack ice, *Beaufort Sea, Ice dynamics.

Two measurements were made of block sizes in newly formed pressure ridges in ice of the Beaufort Sea. Block size measurements assist in the calculation of the fracture energy necessary to build pressure ridges. Two vertical profiles were also obtained, as well as some near-surface salinities in thick first-year ice and in newly formed ice measured in concurrence with ground-based microwave ellipsometer studies. CHEMICAL PROFILE OF THE ROSS ICE SHELF AT LITTLE AMERICA V, ANTARCTICA,
Cold Regions Research and Engineering Lab., Hanover, N.H.
C. C. Langway, Jr., M. Herron, and J. H. Cragin.
Research Report 316, January 1974. 5 p, 1 fig, 1 tab, 17 ref. NSF AG-212, AG-394.

Descriptors: *Glaciers, *Cations, *Provenance, *Antarctic, Sodium, Potassium, Magnesium, Calcium, Movement, Glaciation, Geochemistry, Ions, Water chemistry.
Identifiers: *Ross Ice Shelf(Antarctica).

Measurements of the concentrations of Na, K, Mg, and Ca were made on 28 samples from the 255-m-deep ice core from Little America V, Antarctica. All concentrations decrease sharply with depth from the firn-ice transition at 52 m to somewhere between 125 m and 150 m. From 150 m to 250 m the cationic concentrations are relatively constant. This shows that the ice above 125 m fell as snow on the Ross Ice Shelf and that ice below 150 m originated inland on Marie Byrd Land. (Knapp-USGS)

FOLDING OF COLD ICE,
Ohio State Univ. Research Foundation, Columbus. Inst. of Polar Studies.
M. J. McSaveney.
Antarctic Journal, Vol 8, No 6, p 344-346, November-December 1973. 2 fig, 3 ref. NSF Grant GV-28804.

Descriptors: *Glaciers, *Glaciology, *Antarctic, *Folds(Geologic), Plasticity, Ice, Rheology, Strain, Movement.

Many glaciers in southern Victoria Land, Antarctica, have conspicuous trains of undulations, known as wave ogives, on their surfaces. Perhaps the most extreme example is Bartley Glacier in Wright Valley. Deformation of ice in ogives on Meserve Glacier is an ongoing process. Folding occurs in cold ice and need not relate to a warmer time. Folding and ogive formation are related to the internal stress regime and viscous properties of glacier ice. In glaciers with appreciable concentrations of sand, viscous properties of the ice and sand layers may strongly influence the nonhomogeneous strain observed as folds. (Knapp-USGS)

ANALYSIS OF THE CONCENTRATION OF MICROPARTICLES IN THE LONG ICE CORE FROM BYRD STATION,
Ohio State Univ., Research Foundation, Columbus. Inst. of Polar Studies.
L. G. Thompson, W. L. Hamilton, and C. Bull.
Antarctic Journal, Vol 8, No 6, p 340-341, November-December 1973. 2 fig, 8 ref. NSF Grant GV-32899.

Descriptors: *Dusts, *Antarctic, *Ice, *Climatology, *Oxygen isotopes, Stratigraphy, Glaciology.

During 1973 measurements were made of the concentrations and size distributions of microparticles in 15 representative sections, averaging 1 meter in length, taken from the 2164-meter-long ice core from Byrd Station. The study was designed to clarify relationships between microparticle concentrations and climate, by comparing the concentrations and size distributions with 0-18 values of ice from the same depths. Relationships were established over seasonal, decennial, and millenial time intervals. The total concentration of microparticles (defined as the number of particles greater than 0.65 micron diameter in a 500 microliter sample of meltwater) is greatest in the samples with the largest negative 0-18 values. If annual positive balance remained constant, the vertical strain rate calculated from the thinning of annual layers is -0.000028 per yr. (Knapp-USGS)

EVAPORATION FROM BRINE STORAGE RESERVOIRS,
Oklahoma State Univ., Stillwater Dept of Agricultural Engineering
F. R. Crow.
Available from the National Technical Information Service as PB-231 187, $3.25 in paper copy, $1.45 in microfiche. Oklahoma Water Resources Research Institute, Stillwater, Final Technical Completion Report, March 1, 1974. 46 p, 15 fig, 10 tab, 8 ref. OWRR A-029-OKLA (1) 14-31-0001-4036.

Descriptors: *Evaporation, *Reservoir storage, Seepage, Chemical analysis, Sodium chlorides, Electrical conductance, Temperature, Saline water, Great Plains, *Oklahoma, Brines, *Salinity, Dissolved solids, Salts.
Identifiers: *Brine storage reservoirs, Arkansas River, Red River, *Brine evaporation.

The broad objective was to determine the relationships between saline concentration and the rate of evaporation of brine solutions. Relationships thus established would be applicable to evaporation design problems in brine storage reservoirs that have been proposed for abatement of natural and man-made salt pollution of major portions of the waters of Arkansas and Red Rivers whereby the effluent from highly concentrated brine springs, marshes and salt flats would be stored and ultimately evaporated, if possible. The experiments were conducted in four sunken evaporimeters, 6.5 ft. diameter by 2 ft deep, insulated at the sides and bottom with 12 in. of urethane foam. Liners were used to prevent corrosion and seepage. The original custom installed liners of fiber glass and epoxy resin were unsatisfactory. Two thicknesses of 6 mil. black polyethylene sheet plastic formed a satisfactory liner. Frequent seepage tests were made to detect leaks. Brine evaporation tests were conducted from August 2, 1972 until August 30, 1973. Brines were constituted to desired strength by mixing tap water with granular salt from a commercial salt works near Erick, Oklahoma, one of the major sources of natural brine pollution on the Red River. Four long duration tests in the summer and fall months of 1972 and '73 showed evaporation was inversely proportional to amount of total dissolved solids. Compared with fresh water, evaporation from a brine solution with an average 234,000 ppm total dissolved solids was 19.2% less than from fresh water.

Available from the National Technical Information Service as PB-231 221; $3.25 in paper copy, $1.45 in microfiche. Oregon Water Resources Research Institute, Corvallis, Project Completion Report, March 1974. 34 p, 7 fig, 2 tab, 73 ref. OWRR A-010-ORE (7).

Descriptors: *Energy budget, Evapotranspiration, *Forest management, Energy conversion, *Canopy, *Washington, Model studies, Reviews, *Douglas fir trees.
Identifiers: *Cedar River(Wash), Forest energy analysis, Bowen ratio model.

Application of the mean-profile energy budget analysis to forests is discussed, with regard to limitations imposed by the forest environment.

These limitations are primarily associated with the diffuse structure and aerodynamically rough nature of forest canopies, which contrast with the dense and relatively smooth canopies of agricultural crops. Results of the few forest energy budgets that have been completed are reviewed by country of origin and number of articles. The results from these studies are compared with a clear weather energy budget for a second-growth Douglas-fir site on the Cedar River, Seattle, Washington. Despite obvious limitations upon interpretation of variability from the two estimates made, this appears to be the first forest study to replicate the energy budget measurements. The variability found here confirms the necessity for replication in future experiments. Literature review confirmed that among mean-profile methods, the Bowen ratio was the most widely used model for forest energy budget analysis. Results are based on the Bowen ratio model.

FIELD MEASUREMENT OF EVAPORATION FROM SOIL SHRINKAGE CRACKS,
Agricultural Research Service, Temple, Tex. Blackland Conservation Research Center.
J. T. Ritchie, and J. E. Adams.
Soil Science Society of America Proceedings, Vol 38, No 1, p 131-134, January-February 1974. 3 fig, 2 tab, 9 ref.

Descriptors: *Evaporation, *Soil water, *Soil moisture, *Cracks, Lysimeters, Expansive soils, Unsaturated flow, Soil water movement.
Identifiers: Shrinkage cracks.

Evaporative fluxes from a natural shrinkage crack and from an artifically induced soil shrinkage crack were measured. Evaporation from the soil surface, except at the crack opening, was prevented by covering the lysimeter with plastic film. Evaporation rates from the natural and induced crack averaged about 0.6 mm/day. The horizontal soil water flux in the liquid phase to the crack wall was quite low, indicating that most of the measured evaporation resulted from vapor transport from some distance in the soil pores to the crack walls. Diurnal variations in evaporation rates were closely related to diurnal changes in vapor pressure deficit of the atmosphere above the soil surface. Evaporation rates from the natural crack experiment were practically the same when the crack and soil surface were exposed to the atmosphere as when only the crack opening was exposed. Therefore, most evaporation from cracked, dry clay soil occurs because of the presence of skrinkage cracks. These results suggest a possibility for conserving water by partially filling the skrinkage cracks with dry soil or mulch to reduce evaporation. (Knapp-USGS)

THE EVAPORATION FROM A WATER PAN--ITS LIMITED SIGNIFICANCE (L'EVAPORATION D'UN BAC D'EAU LIBRE--SA SIGNIFICATION RESTREINTE),
Institut Royal Meteorologique de Belgique, Brussels.
F. Bultot, and G. L. Dupriez.
Journal of Hydrology, Vol 20, No 1, p 83-95, September 1973. 2 fig, 2 tab, 9 ref.

Descriptors: *Evaporation, *Evapotranspiration, *Evaporimeters, *Calibrations, *Evaporation pans, Turbulence, Instrumentation, Heat transfer, Diffusion, Solar radiation.

There is no simple relation nor even a strong correlation between daily evaporation measured by means of a water pan and potential evapotranspiration from neighboring natural surfaces. Generally evaporation from the pan is reduced due to the fact that the incident global solar radiation penetrates partially into the water and consequently a portion of the radiant energy flux is not caught by the surface. The evaporation from the pan may also be increased sometimes as a result of fast transfer of heat from underlying water layers towards the surface by turbulent diffusion. (Knapp-USGS)

INTERCEPTION LOSS IN THE HUMID FORESTED AREAS (WITH SPECIAL REFERENCE TO SUNGAI LUI CATCHMENT, WEST MALAYSIA),
Malaya Univ., Kuala Lumpur (Malaysia). Dept. of Geography.
L. K. Sim.
Malay Nat J. Vol 25, No 2, p 104-111, 1972. Illus.
Identifiers: Catchments, *Forested areas, Humid, *Interception loss, *Evaporation, *Malaysia(Sungai-Lui catchment).

A comparison of precipitation measurements on top of the forest canopy with those at ground level was made by installing a rain-gauge funnel above the trees and 3 check gauges under the trees. Measuring the throughfall with 3 gauges which were randomly shifted under the leaf canopy avoided a biased catch. The water lost in transit is called interception loss and in the area tested ranged from 25% to 80%. The intercepted amount of water is higher proportionately from smaller storms. Interception is a temporary phenomenon and the water is subsequently evaporated from the leaves and branches. Evaporation and interception are important components in the hydrologic cycle and together these may reduce to one half the total input of water in the forested areas studied.--Copyright 1973, Biological Abstracts, Inc.

CHANGES IN WATER YIELD OF SMALL WATERSHEDS BY AGRICULTURAL PRACTICES,
Agricultural Research Service, Riesel, Tex.
C. W. Richardson.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 15, No 3, p 591-593, May-June, 1972. 7 fig, 5 ref.

Descriptors: Hydrology, *Flow, Precipitation(Atmospheric), Reservoir yield, *Runoff, Surface waters, Watersheds(Basins), *Small watersheds.

Agricultural practices can have a significant effect on on-site runoff from small watersheds. A simple statement that improved agricultural practices alter by a given percentage the runoff that would have occurred if the practices were not in effect is insufficient for water yield design purposes. The effect of conservation practices on water yield is highly dependent on the management level that is associated with the structural measures. Poor management practices on terraced areas may actually result in increases in water yield. The effect of conservation practices diminishes as watershed size becomes larger. On areas larger than about 300 acres, little effect of conservation practices has been noted. (Skogerboe-Colorado State)

OCEANOGRAPHIC FEATURES IN THE LEE OF THE WINDWARD AND LEEWARD ISLANDS: ERTS AND SHIP DATA,
National Oceanic and Atmospheric Administration, Miami, Fla. Atlantic Oceanographic and Meteorological Labs.
K. J. Hanson, F. Hebard, and R. Cram.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1357-1363, 1973. 9 fig.

Descriptors: *Remote sensing, Satellites(Artificial), *Oceanography, *Atlantic Ocean, Waves(Water), Turbidity, Plankton, Data collections, Pollutant identification.
Identifiers: *ERTS, Windward Islands, Leeward Islands.

Analysis of the ERTS data in portions of the eastern Caribbean is presented for October 1972 showing features which are, as yet, not explained. The sea state and/or swell is modified in a wind shadow of the island; the runoff of island rainfall carries high turbidity water in the mixed layer downstream of the island; or the phytoplankton in the mixed layer of the ocean has increased due to increased nutrients associated with upwelling. Ground truth data obtained in that area during November 1972 are presented. These include vertical temperature structure in the mixed layer and thermocline, and surface measurements of salinity, temperature, and chlorophyll. (See also W74-06619) (Knapp-USGS)

In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1433-1441, 1973. 3 fig, 4 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Oceanography, *Bathymetry, *Depth, Data collections, Mapping, Surveys, Sounding, Topography.
Identifiers: *ERTS, *Little Bahama Bank.

ERTS-1 MSS data taken on October 10, 1972 of the Little Bahama Bank are being used to demonstrate the use of ERTS-1 data for mapping of shallow water features for the purpose of upgrading world navigation charts. Marked reflectance differences occur for the shallow water areas in bands 4, 5, and 6. Digital processing of two adjacent data tapes within the ERTS frame covering an area of about 40 by 40 miles is complete. Correlation of depth measurements to 5 meters was successful. A mathematical model for depth measurements using ratio of voltages in band 4 and 5 was successfully developed and is being tested for

accuracy. Satellite data can provide geographical evidence for verifying existence or nonexistence of doubtful shoal waters now appearing on world charts and considered to be hazardous to shipping. (See also W74-06619) (Knapp-USGS)

LABORATORY EXPERIMENTS WITH SURFACE RUNOFF,
Alberta Dept. of Environment, Edmonton. Div. of Technical Services.
I. Muzik.
Journal of the Hydraulics Division, American Society of Civil Engineers Vol 100, No HY4, Paper 10463, p 501-516, April 1974. 12 fig, 1 tab, 22 ref, append.

Descriptors: *Overland flow, *Rainfall-runoff relationships, *Hydraulic models, *Mathematical models, Surface runoff, Unit hydrographs, Equations, Rainfall intensity.
Identifiers: *Kinematic waves.

Kinematic wave and instantaneous unit hydrograph concepts were used to predict the overland flow of hydraulic models. Laboratory conditions satisfied idealized assumptions of the tested mathematical models: that the hydrographs correspond to direct runoff resulting from rainfall distributed uniformly in time and space over a runoff plane with a constant slope. Time to peak, peak value, and total time base of the instantaneous unit hydrograph are dependent on the rainfall intensity. Predicting runoff by means of a convolution integral leads to erroneous results. Satisfactory results are obtained by analytical solution of the kinematic wave formulation of overland flow equations. Time to equilibrium predicted by the kinematic wave model as a function of rainfall intensity is in good correlation with empirically determined apparent time to equilibrium. Nonlinearity of the rainfall-runoff relationship is not affected by the slope or roughness of the runoff surface. (Knapp-USGS)

ON FLOOD PROBABILITIES OF EAST ALPINE RIVERS,
Zentralanstalt fuer Meteorologie und Geodynamik, Vienna (Austria).
K. Cehak.
Journal of Hydrology, Vol 20, No 1, p 65-82, September 1973. 12 fig, 4 tab, 19 ref.

Descriptors: *Flood frequency, *Alpine, *Probability, Europe, Statistics, Statistical methods, Flood data, Flood recurrence interval, Flood forecasting, Variability.
Identifiers: Flood probability, *Alps.

The flood data of five stations in the East Alps with relatively long observation series were represented by means of Fisher-Tippett II or III distributions. The observations of the longest observation periods were fitted well by the type II curves. A comparison of calculations with only a part of the observations shows that the magnitude of the curvature parameter k of the Fisher-Tippett curves increases with increasing observation period. The series at hand are not long enough to see if there is a convergence to a limiting value of k. A trend test shows an increasing trend in all of the Danube stations after about 1860 and nearly no trend at all in the observations from the southern rivers. The variance spectra show that the series may be considered as realizations of autoregressive processes of the first order. Superposed to the red-noise spectra there are waves with periods of 2.35 and 8 years in the case of the Danube stations and 5.7 and 6.7 years in the case of the southern rivers. (Knapp-USGS)

EIGHT YEARS OF OBSERVATIONS ON THE WATER LEVEL AT QUEBEC AND GRONDINES 1962-1969: PART I--ANALYSIS OF THE TIDAL SIGNAL,
Department of the Environment, Ottawa (Ontario). Marine Sciences Directorate.
G. Godin.
Manuscript Report Series, No 31, 1973. 145 p, 17 fig, 17 tab, 13 ref, append.

Descriptors: *Tides, *Surges, *Water level fluctuations, *St. Lawrence River, Bores, Ice jams, *Canada, Storm surge, Stage-discharge relations.
Identifiers: Quebec, Grondines.

Water levels for Quebec and Grondines are recorded hourly on punched cards since 1962. Saltwater does not reach the stations at Quebec and Grondines although they are both strongly affected by the tide which travels from the Gulf of St. Lawrence and the Atlantic and makes itself felt as far as Montreal. The mean tidal range at Quebec is over 13 feet while at Grondines it exceeds 6 feet. Fluctuations in river discharge affect the level at Grondines markedly while at Quebec, the larger capacity of the river bed diminishes their importance. Besides these sources of variability (tide and discharge), there occur sudden and dramatic changes in level which are obviously related to the atmospheric disturbances, especially cold fronts. Ice jams and ice accumulations upstream cause water level fluctuations during the winter season. (Knapp-USGS)

2F. Groundwater

CAPILLARY PROPERTIES OF SOILS - INFLUENCE UPON SPECIFIC YIELD,
Agricultural Research Service, Fort Collins, Colo.
H. R. Duke.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 15, No 4, p 688-691, July-August, 1972. 6 fig, 2 tab, 9 ref.

Descriptors: *Specific yield, *Capillary action, Subsurface drainage, *Groundwater movement, Groundwater availability, Retention, Safe yield, Dug wells, *Porous media, Soil properties.

Capillary properties of a porous medium are important hydrologic parameters for situations of groundwater flow in which capillary effects are generally considered negligible. Although the utility of the specific yield concept has been proved many times under practical field conditions, the hydrologist should be aware of the limitations of the data he has collected. Of particular importance is an awareness of the errors introduced by using specific yields determined under one set of experimental conditions to predict ground water movement under completely different conditions. The primary purpose has been to show that specific yield as classically defined is not a unique property of the porous medium in which it is measured. (Skogerboe-Colorado State)

A PHYSICAL MODEL FOR PREDICTION AND CONTROL OF SALTWATER INTRUSION IN THE FLORIDAN AQUIFER,
Florida Univ., Gainesville. Dept. of Civil and Coastal Engineering.
B. A. Christensen, and A. J. Evans, Jr.
Available from the National Technical Information Service as PB-231 377, $4.00 in paper copy, $1.45 in microfiche. Florida Water Resources Research Center, Gainesville, Publication No. 27, Jan. 29, 1974. 88 p, 51 fig, 4 tab. OWRR A-022-FLA(1). 14-31-0001-3809.

Descriptors: *Florida, *Saline water intrusion, Water demand, Aquifers, Wells, Recharge, *Forecasting, *Model studies, Groundwater, Aquifer characteristics, *Artificial recharge, Pumping, *Drawdown.
Identifiers: *Hele-Shaw model.

Continuing development of the coastline zone in the middle Gulf area of Florida is increasing the demand for ground water supplies, and in turn increasing the probability of salt-water intrusion. Methods must be developed to make long-range predictions on the effects of increased demands on the Floridan aquifer. A Hele-Shaw model is a physical model which fits the requirements for long-range planning. It is well suited to handling anisotropic aquifers, difficult boundary conditions and can simulate years of field conditions in minutes of model time. The section selected for study lies in a line from the Gulf coast near Tarpon Springs to a point near Dade City and passes through the Eldridge-Wilde well field. The Eldridge-Wilde well field is the major water producer for Pinellas County. This region has experienced several years of dry weather, and pump-

ing has lowered the water levels in the aquifer by a significant amount. This loss of fresh-water head is certain to induce salt-water intrusion. A Hele-Shaw model has been built for this section, and all pertinent geological and hydrological features of the area are included. Steady-state characteristics of the aquifer system have been considered. In particular, the long-term effects due to pumping and artificial recharge were examined. (Morgan-Florida)

UPWARD FLOW FROM SHALLOW WATER TABLES,
Colorado State Univ., Fort Collins.
P. Hamaker.
Available from the National Technical Information Service as PB-231 480 $12.25 in paper copy, $1.45 in microfiche. Ph D Thesis, September 1972. 169 p, 30 fig, 15 tab, 22 ref, append. OWRR B-013-COLO(3).

Descriptors: *Soil water movement, *Groundwater movement, *Evaporation, Water table, Drying, Water levels, Equations.

Upward flow from shallow water tables was studied by application of the flow theory; this leads to a differential equation which describes the interrelationship between the soil properties, the water table depth, the pressure head at the soil surface, and the rate of upward flow. The solution to the equation predicts that for a given soil and water table depth, the upward flux should increase and approach a finite limit as the pressure head at the soil surface becomes more negative. In one series of experiments, upward flow was induced by suction from the soil surface. For a given water table depth, the measured pressure head and hydraulic head distribution and the rate of upward flow as a function of the pressure head at the soil surface were in agreement with flow theory. The upward flux approached a limiting value as the pressure head at the soil surface became sufficiently negative. Moreover, close agreement was obtained between the theoretically predicted and experimentally observed magnitudes of the limiting fluxes. In a second series of experiments, upward flow was induced by evaporative removal of the liquid from the soil surface. The observed behavior of the upward flux was not predicted by theory. A maximum rather than a limiting flux was obtained in most cases as the soil surface dried. The experimental observations could be explained by assuming that the water content-pressure head relationship of the soil during drying was not single valued. (Knapp-USGS)

GROUND-WATER HYDROLOGY OF NORTHERN NAPA VALLEY, CALIFORNIA,
Geological Survey, Menlo Park, Calif.
R. E. Faye.
Water-Resources Investigations 13-73, November 1973. 64 p, 19 fig, 5 tab, 36 ref.

Descriptors: *Hydrogeology, *Groundwater resources, *Aquifer characteristics, *Water quality, *California, Basic data collections, Water wells, Water yield, Groundwater movement, Hydrology, Groundwater recharge, Water utilization, Forecasting, Model studies, Water analysis, Chemical analysis, Transmissivity.
Identifiers: *Napa Valley(Calif).

The alluvium of northern Napa Valley, California, is the principal aquifer of the area and is capable of yielding as much as 3,000 gallons per minute to wells. Recharge is chiefly by percolation from streams and infiltration of precipitation. Discharge is chiefly flow to the Napa River, evapotranspiration, and pumpage from wells. About 190,000 acre-feet of water is presently (1972) stored in the alluvium of northern Napa Valley. Future annual water use in the project area will probably vary between 12,000 and 35,000 acre-feet and, for most purposes, can be supplied by the alluvial aquifer even during extended periods of limited rainfall. Low transmissivities in the alluvium, however, limit the opportunity for obtaining sustained, large yields from wells in much of the valley. Sustained drought conditions in the Napa Valley accompanied by expected increases in the use of groundwater will probably cause significant reductions in the base flow of the Napa River and cause many shallow wells in the area to dry up. Sodium chloride groundwater occurs near Calistoga and in the vicinity of Oakville and in some places is not suitable for irrigation. Model studies indicate that limited migration of sodium chloride water into intensively pumped parts of the aquifer probably will not be a serious problem. (Woodard-USGS)

THE PROBLEM OF DIRECT GROUNDWATER DISCHARGE TO THE SEAS,
Akademiya Nauk SSSR, Moscow. Institut Vodnykh Problem.
I. S. Zektzer, V. A. Ivanov, and A. V. Meskheteli.
Journal of Hydrology, Vol 20, No 1, p 1-36, September 1973. 2 fig, 2 tab, 126 ref.

Descriptors: *Springs, *Groundwater, *Discharge(Water), *Reviews, *Submarine springs, Oceans, Oceanography, Bottom sediments, Water chemistry, Water balance, Tracers, Geochemistry, Hydrogeology.

Studies of groundwater discharge to the seas and oceans are reviewed. They include studies of the role of submarine groundwater discharge in the world water balance, the effect of groundwater on forming the water and salt balances of the seas, the interrelationship between sea and groundwaters in coastal areas, the effect of groundwater discharge on forming mineral deposits at sea and ocean floors, and points of fresh groundwater discharge on the sea floor for water-supply purposes. The methods of investigating groundwater outflow to the seas and oceans are divided into two large groups: those based on studying coastal drainage areas and those based on studying the sea. The coastal techniques are subdivided into the hydrodynamic method, the average long-term water-balance method, the combined hydrological and hydrogeological method, and the analog-simulation method. The sea techniques include those based on studying seawater and those based on studying the sea bottom. The seawater methods incorporate investigations of the electric conductivity, the distribution of temperature, the anomalies of salt composition of seawater and groundwater discharge studies with tracers. The sea-bottom methods include locating groundwater discharge from data on physical or chemical anomalies in bottom sediments/geothermal and geochemical techniques) and investigating structural features of the sea bottom (geophysical method, geomorphological method and observations by divers and submersibles). Experience in studying submarine springs and groundwater discharge to the Baltic and Caspian Seas is discussed. (Knapp-USGS)
W74-06881

A DISCRETE SPACE CONTINUOUS TIME MODELING APPROACH TO NONSTEADY FLOW IN A LEAKY AQUIFER SYSTEM OF FINITE CONFIGURATION,
California Univ., Davis.
M. A. Marino, and W. W-G. Yeh.
Journal of Hydrology, Vol 20, No 3, p 255-266, November 1973. 5 fig, 11 ref.

Descriptors: *Mathematical models, *Artesian aquifers, Drawdown, Groundwater movement, Equations, Finite element analysis.
Identifiers: Leaky artesian aquifers.

A technique is presented that treats a leaky confined aquifer system of finite configuration. By means of a discrete space continuous time modeling approach, the partial differential equation governing the flow system is transformed into a set of ordinary differential equations that can be easily integrated numerically on a high speed digital computer using available subroutines. The finite difference formulation is in effect an explicit scheme. A criterion is developed for which the scheme is computationally stable. A numerical example is presented. (Knapp-USGS)
W74-06887

ON THE LEAKAGE ASSUMPTION APPLIED TO EQUATIONS OF GROUNDWATER FLOW,
Birmingham Univ. (England). Dept. of Civil Engineering.
T. D. Streltsova.
Journal of Hydrology, Vol 20, No 3, p 237-253, November 1973. 3 fig, 24 ref.

Descriptors: *Artesian aquifers, *Groundwater movement, Water table, Equations, *Seepage, Percolation, Water yield, Recharge.
Identifiers: *Leaky artesian aquifers.

The behavior and the delayed response of flow to a well in an unconfined aquifer was studied with consideration of the variable vertical movement of flow inherent in unconfined flow. The effect of elastic storage was also taken into account. The typical S-shaped form of the characteristic time-drawdown curve of an unconfined aquifer was analyzed. The vertical components of flow are a significant factor in the delayed response of an unconfined aquifer while the contribution of the unsaturated zone is essentially subordinate. An equation including allowance for the drainage from the unsaturated zone was derived. (Knapp-USGS)
W74-06888

GROUNDWATER TRACING WITH POST SAMPLING ACTIVATION ANALYSIS,
Pennsylvania State Univ., University Park.
J. K. Schmotzer, W. A. Jester, and R. R. Parizek.
Journal of Hydrology, Vol 20, No 3, p 217-236, November 1973. 10 fig, 1 tab, 20 ref.

Descriptors: *Tracers, *Bromine, Neutron activation analysis, Karst hydrology, Groundwater movement, Sampling, Tracking techniques.

A tracing technique uses low concentrations of a nonradioactive tracer, the bromide ion. Concentrations may be so low that they do not constitute a health or pollution problem. The tracer is detected by activation analysis. No chemical separation techniques are required. The technique is safe, and tracers can be detected as low as 20 parts per billion over background concentrations. The bromide ion does not appear to be lost by precipitation, absorption or adsorption and is biologically stable. The technique was tried on sinkhole, conduit and spring systems in a carbonate terrain, in central Pennsylvania. Ammonium bromide was added in a conduit 500 ft. from its discharge point. Tracer first appeared at the discharge point 1 h after injection (0.11 ppm vs/an average background of 0.03 ppm). The maximum passed at 1 h 30 min and the spread of the spike was estimated to be over 5 h. For a peak maximum of 0.1 ppm, only 3 g of ammonium bromide would have been required. The inlet concentration would have been only 2.8 ppm,

indicating the sensitivity of the method. (Knapp-USGS)
W74-06889

ON THE SOLUTION OF TRANSIENT FREE-SURFACE FLOW PROBLEMS IN POROUS MEDIA BY THE FINITE ELEMENT METHOD,
State Univ. of New York, Buffalo. Faculty of Engineering and Applied Sciences.
R. T-S. Cheng, and C-Y. Li.
Journal of Hydrology, Vol 20, No 1, p 49-63, September 1973. 9 fig, 15 ref. NSF Grant GK-11687.

Descriptors: *Groundwater movement, *Water table, *Finite element analysis, *Numerical analysis, Drawdown, Unsteady flow, Seepage, Dams, Drainage, Porous media.
Identifiers: Free-surface flow.

A numerical procedure is presented to deal with solution of transient free-surface flows in porous media. The governing boundary-value problem for the piezometric potential is solved by the finite element method. The initial-value problem which describes the transient motion of the free-surface is solved by the method of quasi-lineraization. The numerical scheme was applied to isotropic and anisotropic earth dam problems and also to a ditch drainage problem. Excellent agreements were obtained compared with known solutions. This computational procedure is stable and suitable for this class of problems. (Knapp-USGS)
W74-06890

CONSERVATION EQUATIONS FOR NONISOTHERMAL FLOW IN POROUS MEDIA,
Case Western Reserve Univ. Cleveland, Ohio. Div. of Fluid, Thermal and Aerospace Sciences.
A. Dybbs, and S. Schweitzer.
Journal of Hydrology, Vol 20, No 2, p 171-180, October 1973. 23 ref.

Descriptors: *Porous media, *Groundwater movement, *Mass transfer, *Heat flow, Heat transfer, Darcys law, Energy transfer, Equations, Leaching, Sorption.
Identifiers: Nonisothermal flow.

Mass, momentum and energy equations that can be applied to nonisothermal flow in porous media are derived by taking a suitable volume average of the microscopic equations. The resulting macroscopic equations are then appropriate for experimental comparison. These equations can be related to measurable physical quantities of porous media. The energy equation contains a term which may be considered as an 'effective thermal conductivity' due to convection. In most cases this term must be considered and evaluated experimentally. KARST HYDROLOGY--A REVIEW,
Geological Survey, Raleigh, N.C.
H. E. LeGrand, and V. T. Stringfield.
Journal of Hydrology, Vol 20, No 2, p 97-120, October 1973. 3 fig, 1 tab, 59 ref.

Descriptors: *Karst hydrology, *Karst, *Hydrogeology, *Reviews, Groundwater movement, Erosion, Water chemistry, Limestones, Gypsum, Geomorphology, Solubility, Structural geology.

Interest in karst hydrology has increased greatly in the past decade; this interest has resulted in the international exchange of numerous published reports on local areas and on special topical karst problems. Many of these reports have been used in preparing this review paper, which synthesizes results of many workers and focuses attention on: (1) the development of karst features through hydrologic processes; and (2) hydrologic systems of karst terranes. Karst regions of the world are characterized by limestones and other soluble rocks at or near land surface that have been modified by solutional erosion. Such surface features as sinks, long dry valleys, sparse streams, and bare rock and such subsurface features as caverns, arterial solution openings leading to large springs, and a deep water table are typical of karst terranes. These features result in an uneven distribution of permeability in karst systems and surface and subsurface hydrologic conditions that require special hydrogeologic studies. Local high permeability at shallow depth in mature karst regions leads to an ecology associated with a soil-less and water-scarce surface environment. Many practical problems result from this high permeability, including: (1) scarcity and poor predictability of groundwater supplies; (2) scarcity of surface-water supplies; (3) instability of the ground; (4) leakage of surface reservoirs; and (5) an unreliable waste-disposal environment. A LARGE UNDISTURBED, WEIGHING LYSIMETER FOR GRASSLAND STUDIES,
Wyoming Univ., Laramie. Dept. of Agricultural Engineering.
J. D. Armijo, G. A. Twitchell, R. D. Burman, and J. R. Nunn.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 15, No 5, p 827-830, September-October, 1972. 6 fig, 7 ref.

Descriptors: *Lysimeters, *Moisture meters, *Evapotranspiration, Moisture content, Runoff, Water loss, Tunneling machines, *Colorado.

A large weighing type lysimeter was installed in the high plains of northeastern Colorado. The unit consists of a steel tank 10 feet in diameter and 4 feet deep. The container is made of 1-inch thick steel plate. The unit rests on a weighing mechanism consisting of a counter balance and electronic load cells. The soil in the lysimeter is undisturbed with native vegetation. This was accomplished using the tank as a large coring tube to cut out the undisturbed core. All of the related apparatus is placed underground except for a small access manhole located 18 feet from the edge of the unit. Data collection has just begun. Total cost for the unit and installation was $51,000. (Skogerboe-Colorado State)

Transactions of the ASAE (American Society of Agricultural Engineers), Vol 15, No 5, p 912-918, September-October, 1972. 9 fig, 1 tab, 13 ref.

Descriptors: *Groundwater movement, Hydrology, *Capillary conductivity, *Soil moisture, Soil water, Groundwater, Moisture tension, Permeability, Soil physics, Darceys law, Base flow, *Unsteady flow, *Saturated soils, *Mathematical models, Simulation analysis.
Identifiers: *Imbibition.

A numerical model for simulating horizontal imbibition in a radially symmetric flow system was developed. Unsteady radial flow from a cylindrical source into a partially saturated soil was studied in the laboratory and with the model to determine the effects of boundary and initial conditions on this type of flow. The model is based on the solution of the nonlinear partial differential equation for unsteady radial flow. A predictor-corrector modification of the Crank-Nicholson implicit difference method was used to solve the equation subject to the appropriate boundary and initial conditions. Imbibition was studied in the laboratory by allowing liquid to flow into a radially symmetric, soil-filled flow system at pressures which were below atmospheric. Tensiometers along the length of the flow system were used, in conjunction with a pressure transducer-indicator system, to measure the space-time distribution of capillary pressure head in the flow system. A balance was used to monitor the inflow during each test. (Skogerboe-Colorado State)

APPLICATION OF MONTE CARLO METHOD TO SOIL WATER MOVEMENT,
North Carolina State Univ., Raleigh. Dept. of Biological and Agricultural Engineering.
S-F. Shih, and G. J. Kriz.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 15, No 5, p 897-901, September-October, 1972. 5 fig, 4 tab, 8 ref.

Descriptors: *Soil water movement, *Soil physics, *Drainage, Porosity, Permeability, Percolation, Darcey's law, Soil water, Soil moisture, *Monte Carlo method.

An approach for determining approximate solutions to problems of water movement in soils called the Monte Carlo method was presented and demonstrated. The basic concepts of the method are probability distribution, random number generations, and sampling techniques. The method was applied to solve problems of steady state and transient flow with and without recharge. Solutions were obtained directly by Monte Carlo techniques without analytically solving the flow equation. Using the method of solution described, the hydraulic head or potential at any isolated point in the region can be obtained without solving for the hydraulic head or potential at the other mesh points. Comparisons of results obtained using the Monte Carlo method were made with values previously obtained by others. These comparisons indicate that the method is applicable to problems of water movement in soils. (Skogerboe-Colorado State)

IDENTIFICATION OF SOIL ASSOCIATIONS IN WESTERN SOUTH DAKOTA ON ERTS-1 IMAGERY,
South Dakota State Univ., Brookings. Dept. of Plant Science; and South Dakota State Univ., Brookings. Remote Sensing Inst.
F. C. Weston, and V. I. Myers.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 965-972, 1973. 6 fig, 3 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Soil surveys, *Mapping, *South Dakota, Data collections, Data processing, Soil investigations.
Identifiers: *ERTS, Soil associations.

Film color composites of ERTS bands 4, 5, and 7 show the soil association of western South Dakota, and in addition several new soil association areas have been brought to light. In semiarid western South Dakota, landscape features are well defined. Steep valley sides, broad interfluves, and contrasting textures are present in this area and all are clearly visible on ERTS color composites. The 8-million-acre scene that can be scanned on one frame allows for comparisons of soil associations usually over their entire extent. This is an advantage since anomalies immediately become apparent. (See also W74-06619) (Knapp-USGS)

GAMMA RADIATION MEASUREMENTS OF BULK DENSITY CHANGES IN A SOIL PEDON FOLLOWING IRRIGATION,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
R. J. Reginato.
Soil Science Society of America Proceedings, Vol 38, No 1, p 24-29, January-February 1974. 3 fig, 4 tab, 14 ref.

Descriptors: *Bulk density, *Expansive soils, *Nuclear moisture meters, Gamma rays, Irrigation effects, Soil physical properties.

Bulk density in a soil pedon was measured with a gamma-ray transmission technique utilizing Cs-137 and Am-241. Both gamma-ray sources could not be used simultaneously. By alternating sources for each scan down the soil profile, bulk density was found to decrease in the top 6 cm of soil about 30 minutes after water was ponded on the soil surface. As soon as the water drained from the surface, bulk density values approached preirrigation levels. Changes in height of the soil surface upon irrigation corresponded with changes in bulk density. GRAVITY CORRECTION DUE TO A VARIATION OF PRESSURE HEAD WITHIN A CAVITY,
Connecticut Agricultural Experiment Station, New Haven.
J-Y. Parlange.
Soil Science Society of America Proceedings, Vol 38, No 1, p 15-17, January-February 1974. 1 fig, 12 ref.

Descriptors: *Infiltration, *Soil water movement, Percolation, *Pressure head, Moisture content, Unsaturated flow, Tension.

The infiltration of water from small cavities filled with water is affected by gravity, both within and without the cavity and these two effects are of the same order. The effect within the cavity is assessed quantitatively for small spherical cavities that are entirely or partially buried in the soil. As an example, the case of a cavity entirely buried in the soil is discussed in detail. (Knapp-USGS)

MEASUREMENT OF HYDRAULIC CONDUCTIVITY BY MEANS OF STEADY, SPHERICALLY SYMMETRIC FLOWS,
Agricultural Research Service, Madison, Wis. Soil and Water Conservation Research Div.
C. Dirksen.
Soil Science Society of America Proceedings, Vol 38, No 1, p 3-8, January-February 1974. 5 fig, 1 tab, 20 ref.

Descriptors: *Hydraulic conductivity, *Unsaturated flow, *Tensiometers, *Soil water movement, Instrumentation, Tension, Infiltration, Percolation, Pressure head, Moisture content.

The dependence of hydraulic conductivity upon pressure head can be determined from a series of steady, spherically symmetric flows: at any point the hydraulic conductivity is equal to the rate of change of the steady flux per unit solid angle with respect to the pressure head of that point, divided by its radial distance from the center of the water source. This method is useful for in-situ measurements in the field because it requires only one controlled boundary condition, and does not require one-dimensional flow. Hydraulic conductivity values derived from the pressure head in the source cavity in field tests were the same as those derived from tensiometer measurements near the source. A range of hydraulic conductivity values can be obtained faster with a series of different, steady pressure heads in the source cavity, rather than by measurements on a series of tensiometers located at several distances from the source. Gravity tends to distort the spherical symmetry of the flow. For most soils the effect of gravity near the cavity is small enough to obtain satisfactory hydraulic conductivity values. Gravity has no effect on the pressure head distribution directly below the cavity, suggesting that this is a preferred location for tensiometers. The analytical solution obtains the hydraulic conductivity in an exact manner for any position. The radius of the cavity should be kept as small as possible. (Knapp-USGS)

SOLUTION OF EQUATION FOR VERTICAL UNSATURATED FLOW OF SOIL WATER,
California Univ., Santa Barbara.
J. C. Bruch, Jr., and G. Zyvoloski.
Soil Science, Vol 116, No 6, p 417-422, December 1973. 4 fig, 11 ref. OWRR A-039-CAL(6) California Project W-336.

Descriptors: *Unsaturated flow, *Soil water movement, *Infiltration, *Finite element analysis, Equations, Hysteresis, Capillary conductivity, Porous media.
Identifiers: *Galerkin method.

The nonlinear equation describing the unsteady and unsaturated, one-dimensional vertical flow in porous media may be solved by the finite element method employing a Galerkin approach. Finite elements in space and time and linear shape functions were used for two different element configurations, triangles and rectangles. A quadratic form used for the diffusion coefficients and capillary conductivities based on curve-fitting of experimental data of these functions. The results are compared on the basis of element type, as well as to solutions obtained by difference methods and a series solution technique, and are in good agreement. This method is useful in that it is easily programmed, stable, computationally fast, converges rapidly to the solution, and does not require constant parameters over the entire solution domain. MEASUREMENTS OF THE DOWNSLOPE FLOW OF WATER IN A SOIL,
Bristol Univ. (England). Dept. of Geography.
D. R. Weyman.
Journal of Hydrology, Vol 20, No 3, p 267-288, November 1973. 9 fig, 27 ref.

Descriptors: *Soil water movement, *Saturated flow, *Unsaturated flow, *Subsurface runoff, Slopes, Topography, Percolation, Infiltration, Anisotropy, Porosity, Moisture content.

Measurements were made of unsaturated and saturated lateral soil water flow on a convex hillslope with a good soil cover and impermeable bedrock during natural rainstorms. The hydraulics of flow were examined in detail with particular reference to the role of breaks in vertical permeability, the change from saturated to unsaturated flow and the velocity of flow. A zone of soil saturation extends upwards from the slope base. Slope discharge, through the B and B/C horizons, is related to the form of the saturation zone, within which flow is lateral. The time required for vertical percolation and the low hydraulic conductivity of the lower soil horizons result in a hillslope hydrograph which is delayed and attenuated and cannot be regarded as stormflow. During drainage the saturation zone contracts and is replaced by a lateral unsaturated flow system at the profile base which supplies discharge from the B/C horizon without further recharge. In general, either distinct soil horizons or impermeable bedrock are essential for the initiation of lateral flow. Saturated flow is likely to dominate hillslope hydrographs through noncapillary pore spaces but these may be integrated to the point where Darcy's law still holds. Although lateral soil water flow is a widespread phenomenon, it is unlikely to provide storm runoff to the stream unless saturated conditions are generated within the organic horizons or flow within the lower soil horizons is dominated by non-Darcian flow through noncapillary spaces in the soil. A COMPARISON OF HYDRAULIC CONDUCTIVITIES CALCULATED WITH MORPHOMETRIC AND PHYSICAL METHODS,
Wisconsin Univ., Madison. Dept. of Soil Science.
J. Bouma, and J. L. Denning.
Soil Science Society of America Proceedings, Vol 38, No 1, p 124-127, January-February 1974. 5 fig, 1 tab, 11 ref.

Descriptors: *Hydraulic conductivity, *Adsorption, Soil moisture, Analytical techniques, Laboratory tests, Moisture content, Pores, Porosity, Soil water.
Identifiers: *Moisture retention.

Hydraulic conductivity (K) of coarse porous media with packing pores could be calculated not only by physical methods but also with morphometric techniques if matching factors were used. Morphometric K curves are closest to physical curves derived from moisture adsorption characteristics. The morphometric technique can be applied exclusively to small or fragile homogeneous soil materials that cannot be sampled for moisture retention determinations in the laboratory. The pore interaction model of Marshall overestimated K(sat) when morphometric data were used. Moisture retention curves calculated with morphometric data, agreed well in coarse porous media with physical adsorption curves. (Knapp-USGS)

BUFFER INTENSITIES AND EQUILIBRIUM PH OF MINERALS AND SOILS: I. THE CONTRIBUTION OF MINERALS AND AQUEOUS CARBONATE TO PH BUFFERING,
Agricultural Univ., Wageningen (Netherlands). Dept. of Soil Science and Geology.
N. Van Breemen, and W. G. Wielemaker.
Soil Science Society of America Proceedings, Vol 38, No 1, p 55-60, January-February 1974. 2 fig, 1 tab, 16 ref.

Descriptors: *Water chemistry, *Hydrogen ion concentration, *Weathering, Mineralogy, Alkalinity, Carbon dioxide, Silicates, Equilibrium, Carbonates, Aqueous solutions, Soil chemistry.
Identifiers: *Buffering(pH).

Thermodynamic equilibrium considerations were used to calculate pH buffer intensities for a number of aqueous systems involving 16 common soil and rock minerals (gibbsite, kaolinite, allophane, hematite, limonitic iron oxide, quartz, amorphous silica, calcite, siderite, hydrated magnetite + amorphous Fe(OH)3, microcline, albite, anorthite, Mg-montmorillonite, two illites, and Mg-chlorite), gaseous CO2 and 26 dissolved species. The calculation of buffer intensities is outlined for simple oxides and carbonates and for silicate minerals during congruent and incongruent dissolution. Silicate minerals, carbonates and gibbsite provide strong buffering upon addition of strong acid under slightly alkaline to slightly acid conditions. Carbon dioxide at constant partial pressure is far more effective than any of the minerals considered in counteracting the effect of an increase in alkalinity. (See also W74-06905) (Knapp-USGS)
W74-06904

BUFFER INTENSITIES AND EQUILIBRIUM PH OF MINERALS AND SOILS: II. THEORETICAL AND ACTUAL PH OF MINERALS AND SOILS,
Agricultural Univ., Wageningen (Netherlands). Dept. of Soil Science and Geology.
N. Van Breemen, and W. G. Wielemaker.
Soil Science Society of America Proceedings, Vol 38, No 1, p 61-66, January-February 1974. 2 fig, 2 tab, 36 ref.

Descriptors: *Water chemistry, *Hydrogen ion concentration, *Weathering, Mineralogy, Alkalinity, Carbon dioxide, Silicates, Equilibrium, Carbonates, Aqueous solutions, Soil chemistry.
Identifiers: *Buffering(pH).

Equilibrium pH values of different clay minerals, oxides and carbonates at pCO2 of 0.01 atm are between 4.5 and 8, in the range typical for most soils. The agreement between the calculated pH and the abrasian pH for most minerals is reasonable. The pH of a number of soils can be explained

by partial equilibrium between the soil solution and kaolinite, allophane, gibbsite, montmorillonite or calcite. For illite the agreement is less satisfactory. The effects of reducing conditions and the possible role of pH buffering by organic matter are discussed briefly. Application of the phase rule indicates that the specific mineral assemblage of acid sulfate soils provides a nearly ideal pH-stat; addition of moderate amounts of sulfuric acid or lime hardly affects the pH. THERMODYNAMICS OF ION EXCHANGE,
Technion - Israel Inst. of Tech., Haifa. Dept. of Agricultural Engineering.
I. Ravina, and J. DeBock.
Soil Science Society of America Proceedings, Vol 38, No 1, p 45-49, January-February 1974. 2 tab, 13 ref.

Descriptors: *Ion exchange, *Clays, *Water chemistry, Thermodynamics, Sorption, Cation exchange, Chemical potential, Ionization, Free energy.

A local formulation of nonequilibrium thermodynamics was used to define the electrochemical potentials in the ion-clay-water system, thus enabling development of an improved nonempirical approach to cation-exchange processes. The presence of the electrical field in the system is expressed by a proportional increase of the pressure in the double layer. The effect of the electrical field on the chemical potentials of the exchangeable cations is divided into the common electrostatic term and a term dependent on their polarizabilities. For systems containing a mixture of monovalent ions the electrostatic effect of the electrical field is the same for each of the exchangeable cations. Using values of the polarizabilities and intrinsic volumes of the alkali metal cations, the free energies of exchange with sodium in montmorillonite were calculated. The calculated free energies were in good agreement with experimental values. (Knapp-USGS)

A MULTICHANNEL SYRINGE PUMP FOR STEADY STATE FLOW IN SOIL COLUMNS,
New Mexico State Univ., University Park. Dept. of Agronomy.
P. J. Wierenga, R. J. Black, and P. Manz.
Soil Sci Soc Am Proc. Vol 37, No 1, p 133-135. 1973. Illus.
Identifiers: Control, Leaching, *Pumps(Syringe), *Soil columns, *Steady-state slow.

A multichannel syringe pump was designed for maintaining a constant rate of outflow over long periods of time. Low flow rates are obtained by using a timer-control which causes the pump to make 1 cycle/set time interval. The pump is not pulse free, but for many studies requiring steady state water movement in soil columns this is not considered too great a disadvantage. Measured over a 10-day period at a rate of outflow of 173 ml/day, the mean day-to-day variation was less than 0.2 ml/day.--Copyright 1973, Biological Abstracts, Inc.

PHYSICAL MICROCLIMATES OF EROSION-CONTROL STRUCTURES IN A SALT DESERT AREA,
Alberta Univ., Edmonton. Dept. of Botany.
R. W. Wein, and N. E. West.
J Appl Ecol. Vol 9, No 3, p 703-719. 1972. Illus.
Identifiers: *Climates, Desert areas, Erosion control, *Evaporation, Salt desert areas, Soil temperature, Temperature, *Utah, Winds.

A study of the physical microclimates of gully plugs and contour furrows was carried out in a salt desert area of southeastern Utah. Net radiation soil surface temperature and soil water evaporation were measured in the environs of these eroison-control structures. Net radiation rates varied with soil color, slopes, and aspects of the gully plugs and contour furrows. Soil-surface temperatures reached values in excess of 60C for level soils and aspects in July. The northern aspects reached 58C at this time. These temperatures are above the recognized upper limit of tolerance for plant tissue. No differences in evaporation occurred among positions or aspects of gully plugs and contour furrows. This indicates that the dry winds of the area have a great influence on soil water evaporation from bare soil.--Copyright 1973, Biological Abstracts, Inc.

SEASONAL AND STRATIGRAPHIC CONTROLS IN COASTAL FLOODPLAIN SOILS,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Soils.
P. H. Walker.
Aust J Soil Res. Vol 10, No 2, p 127-142. 1972. Illus.
Identifiers: Aeration, *Australia(Macleay River), Coastal plains, Estuarine environment, *Flood plains, Particle, Salinity, Seasonal, Sediments, *Soils, *Stratigraphic controls, Swampland, Water table.

Soils of the Macleay River, Australia, coastal floodplain are developed in a relatively thin veneer of alluvium which is underlain by extensive estuarine deposits representing the postglacial rise of sea level. Soil particle size, water table, salt, and pH distributions relate to catenary variations from levee to back swamp and acid aeration products derived from the underlying estuarine beds. Groundwater data from 50 swampland locations for the period 1962-1968 showed strong seasonal trends. At 39 sites, water-table level correlated closely and positively ($P < 0.05$) with rainfall summed for the 6 mo. (log R6) prior to the month of sampling. Groundwater salinity at 20 sites correlated negatively ($P < 0.05$) with water-table level. Surface soil salinity up to 7.8% and groundwater pH as low as 2 were recorded during the 7-yr period. Reserves of estuarine sediment occurred in certain swamplands which were capable of further acid production. Programs of swamp drainage need to avoid exposure of these reserves. A system of shallow drains, set no deeper than the upper limit of the estuarine deposits, could be used both to remove excess flood water from back swamps and to remove salts produced by aeration of the estuarine materials.--Copyright 1973, Biological Abstracts, Inc.

ONE-DIMENSIONAL VERTICAL INFILTRATION,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div of Environmental Mechanics.
T. Talsma, and J. Y. Parlange.
Aust J Soil Res. Vol 10, No 2, p 143-150. 1972. Illus.
Identifiers: Equations, *Hydraulic conductivity, *Infiltration(Vertical), *Sorptivity.

Various concise equations were proposed, and used, to describe the dynamics of 1-dimensional, vertical, infiltration into uniform soils. Such equations, even when initial and boundary conditions are satisfied, do not describe infiltration with equal accuracy for all materials, especially when applied over a large time interval. Recently proposed equations appear more reliable and require only 2, easily measurable, soil properties, viz., sorptivity and hydraulic conductivity, for application in most practical situations. Numerical, laboratory, and field data are presented. These adequately support the reliability of the solutions. The applicability of the solutions to field soils with systematically varying conductivity is more restricted than the 2 or 3-dimensional solutions.--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF PLANT GROWTH AND FORM OF NITROGEN FERTILIZER ON DENTRIFICATION FROM FOUR SOUTH AUSTRALIAN SOILS,
Waite Agricultural Research Inst., Glen Osmond (Australia).
R. C. Stefanson.
Aust J Soil Res. Vol 10, No 2, p 183-195. 1972.
Identifiers: *Australia, Biological studies, *Denitrification(Soils), Fertilizers, *Nitrogen fertilizer, *Plant growth, Soils, Wheat.

In measuring losses of volatile N in sealed growth chambers, 4 major wheat-growing soils were used, namely, a mallisol, a red-brown earth, a calcareous sand, and a grey-brown soil of heavy texture. The rate of loss varied 1-15 mg N/(kg soil/wk) when nitrate N was applied to the soil; when ammonium N was used, losses were 1-4 mg N/(kg soil/wk) over a 6-wk period. The major component of these losses was N gas with lesser quantities of N2O. Both gases were produced by biological denitrification of soil nitrate. This was confirmed with an incubation experiment which used a portion of the same samples of soil. When nitrate N was applied to the soil, denitrification was increased by increasing soil water content and plant growth. These effects were greatest in the heavy-textured soils. The application of ammonium N to the red-brown earth, amllisol, and gray-brown soil of heavy texture reduced the losses of soil N as N

gas and N2O. Considerable losses of soil N were recorded for the calcareous sand when ammonium N was applied. Plant growth did not affect the losses of soil N from these soils receiving ammonium N.--Copyright 1973, Biological Abstracts, Inc.

SOIL MOISTURE DISTRIBUTION DURING TWO-DIMENSIONAL ABSORPTION FROM A CYLINDRICAL SOURCE,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Environmrntal Mechanics.
T. Talsma, J. Y. Parlange, and P. H. Groenevelt.
Aust J Soil Res. Vol 10, No 2, p 209-214. 1972. Illus.
Identifiers: *Absorption, Diffusivity, *Distribution, *Soil moisture, Sand, Porous media.

The moisture content distribution in fine sand, during 2-dimensional, horizontal, absorption from a cylindrical source, was analyzed using a recently developed theory. Well-justified approximations yield the result that, for a particular rigid porous medium, the time course of the moisture profile depends only on 2 functions, each of which depends on the moisture diffusivity function. This permits the reduction to a common basis of experimental results on a single soil, using different source dimensions and sampling at different times. Moisture profiles, obtained experimentally after various absorption times with 2 source radii, were in satisfactory agreement with the theory.--Copyright 1973, Biological Abstracts, Inc.

ESTABLISHMENT OF MEAN HIGH WATER LINES IN FLORIDA LAKES,
Florida Univ., Gainesville. Water Resources Research Center.
J. H. Davis, Jr.
Available from the National Technical Information Service as PB-231 302, $3.75 in paper copy, $1.45 in microfiche. Publication No. 24, November 1, 1973. 53 p, 11 fig, 3 ref. OWRR A-015-FLA(1). 14-31-0001-3209, 14-31-0001-3509, 14-31-0001-3809.

Descriptors: *Lakes, *High water mark, *Boundaries(Property), Water level fluctuations, *Florida, Aquatic plants, *Dating, *Dendrochronology.

This project was undertaken to provide a method of detecting former highwater levels by using plants presently growing in, and near, Florida lakes. Species, position, growth form, and other characteristics were used to develop viable statistics. The project was not intended for final legal determinations of former mean highwater lines but for the determination, where applicable flora exists, of the physical location of the boundary between riparian land and state-owned lake bottoms to assist in the formulation of a state policy for the establishment of mean high-water monuments in Florida lake basins. Results show this botanical method can be used in some cases with a high degree of reliability to date shoreline water positions back to 1845, when Florida became a state. The inspections of lake shores not only included the vegetation and particular plants, especially large old trees, but also some of the geology, soils, sediments, and the stage records of lake levels. The Cabinet Board of Trustees of the Internal Improvement Trust Fund and the State Bureau of Geology collaborated in this study. (Morgan-Florida)

Available from the National Technical Information Service as PB-231 311, $3.75 in paper copy, $1.45 in microfiche. Oklahoma Water Resources Research Institute, Stillwater, Completion Report, (1973). 54 p, 12 fig, 1 tab, 30 ref. OWRR A-044-OKLA(2).

Descriptors: *Dispersion, Lakes, *Mixing, *Stratification, *Hydraulic models, Model studies, *Distribution patterns, Simulation analysis.
Identifiers: OSU stratified lake model, *Vertical distortion.

The similitude problems in modeling flow in stratified lakes was investigated both theoretically and experimentally. Models with transparent sides were built with representative inlets. Using salt solutions of varying density and coloration, the establishment of stratified conditions, the control and modeling of inlet flows, and the use of visualization methods were developed. Special attention was given to the problem of vertical distortion: in the modeling of lakes, it is necessary to use a different depth scale than the horizontal length scale. Too little vertical depth in the model allows boundary layer effects to dominate; too much depth and distortion may invalidate the similitude of the model to the lake. Two models with different amounts of vertical distortion were built and compared. The modeling technique was developed to the point where consistent results are attainable. Quantitative methods using photographic sequences and computer analysis of time lines were used to show the basic flow patterns of inlet flows into stratified lakes, and to show the application and limitations of vertical scale distortion.

MATERIALS INPUT OF LAKE CHAMPLAIN: A SYNOPTIC APPRAISAL,
Vermont Univ., Burlington. Dept. of Zoology.
M. Potash, and E. B. Henson.
Water Resources Bulletin, Vol 10, No 2, p 348-359, April 1974. 2 fig, 4 tab, 12 ref.

Descriptors: *Lakes, *Water quality, *Hydrologic budget, *Sedimentation, Dissolved solids, Conductivity, Eutrophication, Water pollution sources, *New York, *Vermont, Lake morphology, Lake morphometry, Path of pollutants.
Identifiers: *Lake Champlain.

In Lake Champlain (New York-Vermont), detailed, regional studies were made, and the results integrated, to yield total lake conditions. Using specific conductance measurements, and values of total dissolved solids calculated from them, an approach was made to assessing the materials budget of the lake. The sampling program involved inventorying all 319 tributaries, determining the watershed area for each, and dividing the Champlain basin into appropriate hydrographic regions. Data were obtained from samples collected from 41 selected streams (representing 97.5% of the annual water input), sampling occurring in all seasons of the year since 1970. Over one million metric tons of total dissolved solids enter Lake Champlain annually, about two-thirds (63%) from the eastern (Vermont) portion and almost one-fourth (22%)

from the western (New York) part of the drainage basin, the remainder (15%) entering from the south end. Of the total quantity added annually, 17.4% is retained in the lake, indicating that a solids buildup is occurring at a significant rate. Specific conductance, and therefore total dissolved solids, may be utilized as a convenient indicator of water quality conditions, and the results should be applied to permit more efficient watershed management. (Knapp-USGS)

WALDEN'S WAY REVEALED,
Geological Survey, Boston, Mass.
E. H. Walker.
Man and Nature, p 11-20, December 1971. 2 fig.

Descriptors: *Surface-groundwater relationships, *Water level fluctuations, *Lakes, *Massachusetts, Water balance, Glacial drift, Hydrogeology.
Identifiers: *Walden Pond(Mass).

The water level of Walden Pond, Massachusetts, rises and falls through seasons and years almost exactly in agreement with changes in local groundwater level. Walden occupies a glacial kettle. There probably are a few feet of sand and silt on the floor of Walden and underneath lies glacial till, and deeper is bedrock. The sand and gravel is highly pervious and yields hundreds of gallons of water per minute to a large number of town and industrial wells. The rise of water level in Walden and in the sand and gravel around it during winter and spring and the decline through summer and autumn is the normal change observed in almost all wells and water table ponds in this part of the country. Replenishment of groundwater occurs mainly in the cold months, when evaporation and plants return very little water to the air, and most of the water from rain and melting snow sinks into the ground. After plants start growing in spring their roots draw so much water from the soil that the soil becomes dry enough to absorb most of the rain that falls in summer. As a result, rain in summer provides scarcely any relenishment to groundwater reservoirs. Meanwhile, the water in the ground leaks away continually. So the water in the ground lowers all through the growing season. Walden Pond has been unusually low during the past several years. A decline that began in 1963 continued until, at the end of 1966, water level was about 6 feet below what is considered normal. The pond has risen gradually since early in 1967 but still is not quite back to its usual level. (Knapp-USGS)

Zoologisches Forschungsinstitut und Museum Alexander Koenig, Bonn (West Germany).
K. H. Lueling.
Zool Beitr. Vol 19, No 1, p 93-108, 1973. Illus.
Identifiers: *Aequidens-rivulatus, Bryconamericus-peruanus, Coasts, Dorminator-latifrons, *Fishes, Lebiasina-bimaculata, Pimelodella-yuncensis, *Lagoons, *Peru(Laguna de Vegueta).

The Laguna de Vegueta is an elongated tub-shaped lagoon in mid-Peru, north of the community of Hacho on the Pacific Ocean. This lagoon and its fishes were studied in 1970-1971. The biologic and hydrologic relationships governing this location are described. Its climate is moderated by the Humboldt current. Quite near the shores of the lagoon are salt deposits, as a result of which the water is distinctly salty. However, the lagoon is fed by wells supplying pure, crystal-clear earth-filtered fresh water. The fish species represented in the lagoon include Bryconamericus peruanus, Lebiasina bimaculata, Aequidens rivulatus, Pimelodella yuncensis, Dorminator latifrons. A map of northwestern South America shows several locations where Aequidens rivulatus was found.--Copyright 1973, Biological Abstracts, Inc.

THE EFFECT OF SEASON AND ANIMAL SIZE ON THE CALORIC CONTENT OF DAPHNIA PULICARIA FORBES,
Fisheries Research Board of Canada, Winnipeg (Manitoba). Freshwater Inst.
N. B. Snow.
Limnol Oceanogr. Vol 17, No 6, p 404-413. 1972. Illus.
Identifiers: *Caloric content, *Canada(West Blue Lake-Manitoba), *Daphnia-pulicaria, Energy content, Fat, Growth, Season, Size, Aquatic animals.

The population of D. pulicaria in West Blue Lake, Manitoba (Canada) was sampled monthly for over a year. Very small animals were entirely absent during winter when no reproduction was occurring, while large, red, fat-laden individuals were more numerous than at any other time. In spring, large numbers of small animals appeared and the largest size classes virtually disappeared, to reappear the following winter. The large, fat, winter animals had a very high energy content (approximately 9000 cal/g dry wt.) whereas smaller individuals at the same time had values similar to those later in summer. Caloric content of all sizes decreased as summer progressed (approximately 4900 cal/g dry wt.) and the inequality between different sizes also disappeared. During Nov. the mean caloric content began to rise again and once more large animals had higher values than smaller ones.--Copyright 1973, Biological Abstracts, Inc.

AN ECOLOGICAL STUDY OF VELLOZIA SCHNITZLEINIA, A DROUGHT-ENDURING PLANT OF NORTHERN NIGERIA,
Ife Univ. (Nigeria). Dept. of Biological Sciences.
A. J. Owoseye, and W. W. Sanford.
J Ecol. Vol 60, No 3, p 807-817. 1972. Illus.
Identifiers: Chloroplast, Cultivation, Cyanin, *Drought response(Plants), Ecological studies, *Nigeria, Sucrose, *Vellozia-Schnitzleinia-Var-Occidenta.

Vellozia schnitzleinia var. occidentalis, known to occur only in a restricted area of northern Nigeria, was observed in situ and under cultivation. Its habitat is described. The plant is particularly remarkable for its rapid response to drought, and the ability of its leaves to survive over 5 mo. without water and to 'resurrect' within a few days after the onset of rains. Under cultivation, plants become quiescent whenever water is withheld. Within 24 hr, chloroplasts in the leaf mesophyll begin to fragment and they completely disappear within 3-5 days. At the same time, anthocyanin develops abaxially in the cells adjoining the fibers of the midrib and in the translucent cells surrounding the vascular bundles. Leaves become brown-purple, brittle and adaxially folded. Sucrose content of leaves, on a dry-weight basis, increases above the normal. With watering, chloroplasts begin regenerating within 24 hr, anthocyanins quickly disappear and sucrose content drops, for a time, below normal.--Copyright 1973, Biological Abstracts, Inc.
W74-06768

PREDATION ON THE FRESHWATER BIVALVE UNIO PICTORUM BY THE RAT, RATTUS NORVEGICUS, (IN ITALIAN),
Parma Univ. (Italy). Istituto di Zoologia e Anatomia Comparata.
G. Gandolfi, and V. Parisi.
Ateneo Parmense Acta Nat. Vol 8, No 1, p 5-31, 1972. Illus. (English summary).
Identifiers: Anodonta-cygnaea, Bivalves, Cerastoderma-lamarcki, Planorbarius-corneus, *Italy(River Taro), *Predation, Rattus-norvegicus, Rivers, Unio-pictorum, Viviparus-ater, Viviparus-contectus, *Rodents, *Mollusks(Bivalve).

Cases of predation by R. norvegicus (Berkenhout) on the freshwater mollusk U. pictorum are considered in conjunction with information on predation by the same rodent on bivalve mollusks Anodonta cygnaea and Cerastoderma lamarcki and on the gastropods Viviparus ater, V. contectus and Planorbarius corneus. In the case of U. pictorum 6 stations along a 1500-m stretch of the River Taro (Italy) and 2 stations more than 100 km away were studied. The techniques used to open U. pictorum, deducible from the shell breaks, lead to some ethologic considerations. The differences in habits between colonies of rats in the field and between their methods of breaking bivalve mollusks and those of unexperienced laboratory rats suggest some hypotheses concerning cultural transmission based on observational learning. The incidence of predation on the population of U. pictorum also has a definite ecologic significance in that a large fraction of the secondary production of the river ecosystem is exported by this route, and the rat is the chief biotic factor in U. pictorum population control in the studied areas.--Copyright 1973, Biological Abstracts, Inc.
W74-07008

CHANGES IN RATE AND RHYTHMS OF DEVELOPMENT OF PERENNIAL POLYCARPIC PLANTS AT DIFFERENT ALTITUDES IN HUMID HIGH MOUNTAINS, (IN RUSSIAN),
A. A. Malyshev.
Bot Zh. Vol 57, No 9, p 1069-1081. 1972. English summary.
Identifiers: Altitudes, Anthemis, Bromus, Centaurea, Festuca, Fritillaria, Humid, Mountains, Muscari, Perennials, *Polycarpic plants, Polygonum, Primula, Pulsatilla, Scabiosa, *USSR(Caucasus).

The reorganization of developmental cycles of perennial polycarpic plants (Polygonum, Scabiosa, Aetheopappus (Centaurea), Anthemis, Pulsatilla, Muscari, Fritillaria, Primula, Festuca and Bromus) after transplantation from one altitudial level to the other from northeast Altai and northwest Caucasus (USSR) was studied. Cultural and spontaneous perennial polycarpic plants adapt themselves to the short vegetational period of mountains by means of morphogenetic reorganization of their short developmental cycles. Up to the upper limits of the middle-mountainous zone (i.e., up to the 2000 m height in the Caucasus and up to the 1000 m height in Altai) the number of yearly developmental cycles observed in shoots of one generation in plants is the same as on the plain. In the alpine belt or in the transitional part of subalpine belt (Caucasus-2400-2700 m, Altai-1750) generative development of plants is less intensive. In species studied shoots here form an extra yearly cycle. This morphogenetic delay in ontogenesis facilitates the increase of yearly cycles of generative development of plants. In the year of fruiting the shoots of perennials develop faster in conditions of high mountains than in lower zones, forming seeds earlier. This is explained by the fact that buds are more developed and by development of plants in favorable conditions of longer days and more intensive insolation.--Copyright 1973, Biological Abstracts, Inc.
W74-07014

AN ANNOTATED LIST OF THE SUMMER VERTEBRATE FAUNA OF UPPER LUSK CREEK, POPE COUNTY, ILLINOIS,
Eastern Kentucky Univ., Richmond. Dept. of Biological Sciences.
M. P. Thompson, Jr.
Trans Ky Acad Sci. Vol 33, No 3/4, p 49-56. 1972.
Identifiers: Abundance, Creeks, Distribution, *Fauna(Vertebrates), *Illinois(Lusk Creek), Moxostoma-duquesnei, Rana-sylvatica, Scaphiopus-holbrooki, Summer.

A summer survey of the vertebrates of the Lusk Creek Basin in Southeastern Illinois produced 120 species, including 27 fishes, 13 amphibians, 14 reptiles, 53 birds, and 22 mammals. The spadefoot toad (Scaphiopus holbrooki), wood frog (Rana sylvatica) black redhorst (Moxostoma duquesnei), and other species unreported or uncommon in the locality were collected. A phylogenetic list of forms was compiled with annotations on local distribution, abundance, and habitat preference.--Copyright 1973, Biological Abstracts, Inc.

SOCIAL INTERACTION BETWEEN JUVENILE COHO (ON-CORHYNCHUS KISUTCH) AND FALL CHINOOK SALMON (O. TSHAWYTSCHA) IN SIXES RIVER, OREGON,
Wisconsin Univ., Madison. Lab. of Limnology.
R. A. Stein, P. E. Reimers, and J. D. Hall.
J Fish Res Board Can. Vol 29, No 12, p 1737-1748. 1972. Illus.
Identifiers: *Chinook salmon, *Coho salmon, Fish interaction, Juvenile fish, Oncorhynchus-kisutch, Oncorhynchus-tshawytscha, *Oregon(Sixes River), Rivers, Spawning.

Spawning and emergence of coho and fall chinook salmon overlapped in timing and location in Sixes River, Oregon. In early spring both species were distributed throughout most of the river system. Underwater observations during this period indicated that both species occupied the same habitat. As temperatures increased, coho disappeared from the main river, but continued to occupy cool tributaries. Fall chinook were found primarily in the main river until early summer, when they moved to the estuary. In flowing-water observation troughs coho assumed social dominance and defended space near the source of incoming food. In allopatry in the troughs, both grew at similar rates, but coho maintained lower population densities than did chinook. In sympatry in the troughs or in cool tributary streams, coho grew faster than chinook. Coho had brighter fin and body colors, greater fin development, deeper bodies, and were heavier than fall chinook of the same length. It is suggested that the population of fall chinook salmon in Sixes River might be adversely affected by an increase in numbers of coho. Evidence suggests that ecology of native fishes should be examined closely before widespread manipulation of fish stocks is encouraged.--Copyright 1973, Biological Abstracts, Inc.

OBSERVATIONS ON COMPARATIVE PROPENSITIES FOR CARP FRY DESTRUCTION BY ADULTS AND LAST INSTAR PREIMAGINAL STAGES OF PREDATORY AQUATIC INSECTS,
Taraporewala Marine Biological Research Station, Bombay (India).
G. A. Shirgur, and H. G. Kewalramani.
Proc Indian Acad Sci Sect B. Vol 76, No 3, p 85-89. 1972.
Identifiers: *Aquatic insects, *Carp fry, Catla-Catla, Cirrhina-Mrigala, Coleoptera, *Comparative studies, Cybister, Heteroptera, Labeo-Rohita, Odonata, *Predation.

Studies on comparative propensities for carp fry (Catala catla, Labes rohita, Cirrhina mrigala) destruction by preimaginals and imaginals of both Heteroptera and Coleoptera and Odonata nymphs, were made under laboratory conditions. Coleopterans, especially Cybister larvae, were the most predaceous of all the insects, whereas the Odonata nymphs the least. An interesting feature was observed in case of the preimaginals of Coleoptera and Heteroptera. The preimaginals display more carp fry destructive tendency than their respective adults.--Copyright 1973, Biological Abstracts, Inc.

Descriptors: *Reservoir silting, *Sedimentation, Erosion, Sediment control, Sediment yield, Desilting, Reservoir design, Reservoir operation, Water management(Applied), Sedimentation rates.
Identifiers: *Reservoir sedimentation.

Reservoirs, as well as lakes and estuaries, are subject to sediment accumulation. The rate at which sedimentation occurs is accelerated or diminished by man's activities. Acceptable rates of sedimentation may be determined on the basis of costs of sediment storage and removal. A review of reservoirs constructed with sediment removal capabilities is given. The rates of reservoir sedimentation in the United States are summarized based on reliable data obtained from all sizes of reservoirs. Problems confronting the engineer concerning reservoir construction and maintenance are discussed on the basis of these data. (Knapp-USGS)

ESTIMATING SOIL EROSION FROM THE REDISTRIBUTION OF FALLOUT CS-137,
Agricultural Research Service, Oxford, Miss. Sedimentation Lab.
J. C. Ritchie, J. A. Spraberry, and J. R. McHenry.
Soil Science Society of America Proceedings, Vol 38, No 1, p 137-139, January-February 1974. 2 fig, 3 tab, 18 ref.

Descriptors: *Soil erosion, *Tracers, *Fallout, *Radioisotopes, *Cesium, Erosion, Land use, Path of pollutants, *Mississippi, Watersheds(Basins).

The movement of fallout Cs-137 from soils in three north Mississippi watersheds is logarithmically (r=0.89) related to potential soil loss as calculated by the Universal Soil Loss Equation. Analysis of other published data also showed a significant (r=0.95) logarithmic relation existing between soil loss and Cs-137 loss from soils. It may be possible to calculate soil loss from the movement of fallout Cs-137 in watersheds. Also it may be possible to calculate the movement of surface adsorbed nutrients like Cs-137 in watersheds from soil erosion data. (Knapp-USGS)
W74-06901

AN ISOKINETIC SAMPLER FOR WIND EROSIBLE SILT AND CLAY PARTICLE MEASUREMENT,
Illinois Univ., Urbana. Dept. of Agricultural Engineering.
G. F. Arkin, and E. R. Perrier.
Soil Science Society of America Proceedings, Vol 38, No 1, p 151-152, January-February 1974. 1 fig, 2 tab.

Descriptors: *Sampling, *Soil erosion, *Wind erosion, Equipment, Particle size.
Identifiers: Wind tunnels.

A sampler for soil erosion studies enables rapid measurement of a totally representative profile distribution of soil particles entrained in a turbulent boundary layer within a wind tunnel test section. Differences between mass flux, soil particle concentration, and particle size distribution measured at the sampling point and in the air stream are minimized by isokinetic sampling. (Knapp-USGS)

EFFECT OF VARYING THE ON-OFF TIME OF RAINFALL SIMULATOR NOZZLES ON SURFACE SEALING AND INTAKE RATE,
Agricultural Research Service, Morris, Minn. North Central Soil Conservation Research Center.
L. L. Sloneker, and W. C. Moldenhauer.
Soil Science Society of America Proceedings, Vol 38, No 1, p 157-159, January-February 1974. 1 fig, 2 tab, 8 ref.

Descriptors: *Soil erosion, *Simulated rainfall, Infiltration, Model studies, Runoff, Soil surfaces, Surface sealing.

In many erosion studies, rainfall intensity is controlled by varying the on-off time of sprinklers. After a certain point, the energy to initiate runoff is increased as the nozzle off-time is increased. Water intake rate is increased as application rate is increased even though runoff is taking place. (Knapp-USGS)

SOME COMMENTS ON SEAGRASSES AND SEDIMENTARY PROCESSES,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
J. R. Schubel.
Special Report 33 (Reference 73-12), November 1973. 32 p, 8 fig, 26 ref.

Descriptors: *Sedimentation, *Vegetation effects, *Bottom sediments, *Grasses, Beaches, Surf, Erosion, Turbidity.
Identifiers: *Seagrasses.

Seagrasses alter the prevailing sedimentation processes in a variety of ways; their net effects are generally to increase the sedimentation rate, to preferentially concentrate the finer particle sizes, and to stabilize the underlying sedimentary deposits. These effects are produced by several processes: (1) by the direct and indirect extraction and entrapment of fine waterborne particles by the grass blades, (2) by the formation and retention of particles produced locally within the grass beds, (3) by the binding and stabilization of the sedimentary substrate by the grass rhizome and root systems, and (4) by the alteration of the chemical environment both of the overlying water and of the underlying sediments. Analytica Chimica Acta, Vol 67, No 1, p 240-242, November 1973. 2 fig, 7 ref.

Descriptors: *Water analysis, *Nitrates, *Chlorides, *Calcium, *Design criteria, Aqueous solutions, Materials, *Electrodes.
Identifiers: *Ion-selective electrodes, Chemical interference, Detection limits, Universal electrodes.

A design is proposed for a universal ion-selective electrode which includes many of the advantages of the selectrode, but of a much simpler construction. The electrode consists of a graphite paste prepared from a liquid ion exchanger containing

the ion of interest and commercial graphite powder. Chloride, nitrate, and calcium ion-selective pastes were prepared for use in electrodes to be tested. The chloride and nitrate electrodes gave linear plots of E versus-log a over the activity range of 0.003-0.85 M with a slope of 54 mV/decade activity change. No interference occurred with the chloride electrode when 0.001 M Br, I, NO3, and ClO4 were present. The nitrate electrode was unaffected by 0.00001 M Cl, Br, I, and ClO4. The calcium electrode plot was linear over the activity range of 0.001-0.1 M with a slope of 30 mV/decade. At an activity level of 0.001 M Ca, 0.0001 M Mg and Ba and 0.01 M Na caused no interference. ELECTRO-OSMOTIC EFFECTS IN A BENTONITE-WATER SYSTEM,
Harcourt Butler Technological Inst., Kanpur (India). Dept. of Chemistry.
R. C. Srivastava, and P. K. Avasthi.
Journal of Hydrology, Vol 20, No 1, p 37-47, September 1973. 5 fig, 3 tab, 10 ref.

Descriptors: *Electro-osmosis, *Bentonite, *Electrochemistry, *Hydraulic conductivity, Darcys law, Clays, Equations, Membrane processes, Water chemistry, Clay minerals.

Measurements of the electro-osmotic velocity, streaming potential and hydraulic conductivity for a bentonite-water system are presented. The flow of electricity in the presence of both hydraulic pressure and electrical potential difference is given by the usual linear phenomenological equation, but the flow of water in the presence of both pressure and electrical potential gradients is given by a nonlinear exponential relationship. The relationship between water flux and pressure gradient in absence of electrical potential gradient is adequately represented by Swartzendruber's equation. Unless the applied potential difference exceeds a certain threshold value, the flow of water due to electro-osmosis does not take place. The plot of electro-osmotic velocity against applied potential difference, though linear, does not pass through the origin. The counter effect of streaming potential cannot account for the non-Darcian behavior. (Knapp-USGS)

SEASONAL CHANGES OF LITTORAL TRANSPORT AND BEACH WIDTH AND RESULTING EFFECT ON PROTECTIVE STRUCTURES,
Maryland Geological Survey, Baltimore.
T. H. Slaughter.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1259-1267, 1973. 17 fig, ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Beach erosion, *Sedimentation

Littoral drift, *Maryland, *Chesapeake Bay, Surveys, Mapping, Data collections, Aerial photography, Terrain analysis, Sedimentary structures, Sand bars, Sand waves.
Identifiers: *ERTS.

The shorelines of Maryland's portion of the Chesapeake Bay exhibit seasonal changes in direction of littoral transport and resulting beach width. Observation and study of this process at selected locations emphasizes the necessity of study for a complete year's seasonal cycle before stating erosion rates of an area to be protected by structures and the cyclical presence or absence of beaches. Seasonal beach conditions at four sites and resulting physical changes to protective structures were analyzed using ERTS-1 multispectral photography. (See also W74-06619) (Knapp-USGS)

RECOGNITION OF BEACH AND NEARSHORE DEPOSITIONAL FEATURES OF CHESAPEAKE BAY,
Maryland Geological Survey, Baltimore.
R. T. Kerhin.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1269-1274, 1973. 5 fig, 4 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Beach erosion, *Sedimentation, Littoral drift, *Maryland, *Chesapeake Bay, Surveys, Mapping, Data collections, Aerial photography, Terrain analysis, Sedimentary structures, Sand bars, Sand waves.
Identifiers: *ERTS.

Beach and nearshore depositional features are being mapped by ERTS to analyze littoral drift and sedimentation patterns in areas of little or no data. Evaluation of beach and nearshore features aids in the selection of small boat harbors, shoreline protective structures, and general coastal zone development. Through ERTS-1 aircraft support imagery, cuspate forelands, welded beach ridges, and recurved spits are mapped. The nearshore depositional features exhibit a bar and trough topography with three distinct types of sedimentary structures: longshore, transverse, and reticulated bars. Synoptic coverage of beach and nearshore depositional features by ERTS-1 data help in determining the general sedimentation patterns, growth of the beach features, and stability of the bar and trough topography. (See also W74-06619) (Knapp-USGS)

APPLICABILITY OF ERTS-1 IMAGERY TO THE STUDY OF SUSPENDED SEDIMENT AND AQUATIC FRONTS,
Delaware Univ., Newark. Coll. of Marine Studies.
V. Klemas, R. Srna, W. Treasure, and M. Otley.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1275-1290, 1973. 18 fig.

Descriptors: *Remote sensing, Satellites(Artificial), *Turbidity, *Wetlands, Sea water, Coasts, Suspended load, Sediment transport, Littoral drift, Currents(Water), Saline water intrusion, Estuaries, Saline water-freshwater interfaces, Dye releases, Tracers, Data collections.
Identifiers: *ERTS, *Interfaces(Aquatic), *Delaware Bay.

Imagery from three successful ERTS-1 passes over the Delaware Bay and Atlantic Coastal Region was evaluated to determine visibility of aquatic features. Data gathered from ground truth teams before and during the overflights, in conjunction with aerial photographs taken at various altitudes, were used to interpret the imagery. Visual inspection, density slicing, and multispectral analysis of the imagery revealed strong suspended sediment patterns and several distinct types of aquatic interfaces or frontal systems. ERTS-1 Multispectral scanner band 5 (0.6-0.7 microns) gave the sharpest definition of interfaces between waters of differing turbidity. Band 4 (0.5-0.6 microns), due to its deeper water penetration, was more sensitive to patterns having lower turbidity, yet was veiled by a uniform blanket of atmospheric scattering making identification of sediment patterns more difficult. Band 6 (0.7-0.8 microns) and band 7 (0.8-1.1 microns) clearly delineated the shoreline and discriminated water from land in the marshes. (See also W74-06619) (Knapp-USGS)
W74-06666

CORRELATION OF ERTS MULTISPECTRAL IMAGERY WITH SUSPENDED MATTER AND CHLOROPHYLL IN LOWER CHESAPEAKE BAY,
National Aeronautics and Space Administration, Langley Station, Va. Langley Research Center.
D. E. Bowker, P. Fleischer, T. A. Gosink, W. J. Hanna, and J. Ludwick.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1291-1297, 1973. 5 fig, 4 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Suspended load, *Algae, *Chesapeake Bay, Turbidity, Data collections, Water quality, Estuaries, *Chlorophyll, Sedimentary structures, Tides, Currents(Water), Sand waves, Monitoring, *Virginia.
Identifiers: *ERTS, James River(Va).

The feasibility of using ERTS multispectral satellite imagery to monitor the characteristics of estuarine waters is being investigated. Greatest detail in suspended matter is revealed by MSS band 5. Near-surface suspended sediment load and chlorophyll can be observed in bands 6 and 7. Images received partially define extent and location of high suspended sediment concentrations. Turbid water of the James River enters Chesapeake Bay as a plume that can be traced along the southern shore and extends seaward of Cape Henry. An area of highly variable turbidity exists in the lower bay between Hampton and Cape Charles, and may be related to strong tidal currents and large-scale bedforms found here. Net quantity of suspended matter in the lower bay has been decreasing since the inception of the study, and represents the diminution of turbid flood waters carried into the bay in late September, 1972. The results so far point to the utility of MSS imagery in monitoring estuarine water character for the assessment of siltation, productivity, and water types. (See also W74-06619) (Knapp-USGS)
W74-06667

PLUME DEVELOPMENT IN LONG ISLAND SOUND OBSERVED BY REMOTE SENSING (ERTS-1),
Geological Survey, Hartford, Conn.
F. H. Ruggles, Jr.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1299-1303, 1973. 2 fig, 1 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Turbidity, Mixing, Saline water-freshwater interfaces, Data processing, Data collections, Water circulation, *Connecticut, *Sediment transport.
Identifiers: *ERTS, *Long Island Sound.

As the Connecticut River flows into Long Island sound, large plumes are developed during the mixing of ocean and estuarine waters. Plumes were delineated for July 28, October 8, October 27, and December 2, 1972, by analyzing ERTS-1 imagery with the SRI Electronic Satellite Image Analysis Console (ESIAC). Insertion of MSS band 5 into the ESIAC produced the best result in this analysis. The four plumes that have been delineated provide the first input to a time-lapse analysis of circulation patterns at the eastern end of Long Island Sound. (See also W74-06619) (Knapp-USGS)

ERTS-1 OBSERVATIONS OF SEA SURFACE CIRCULATION AND SEDIMENT TRANSPORT, COOK INLET, ALASKA,
Alaska Univ., College. Inst. of Marine Science.
F. F. Wright, G. D. Sharma, and D. C. Burbank.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentation, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1315-1322, 1973. 3 fig, 4 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Estuaries, *Alaska, Water circulation, Path of pollutants, *Sediment transport, Mixing, Data collections, Glacial drift, Tides, Sedimentation, Erosion, Currents(Water).
Identifiers: *ERTS, *Cook Inlet(Alas).

Cook Inlet is a large tide-dominated estuary in southern Alaska. Highly turbid streams enter the upper inlet, providing an excellent tracer for circulation in the lower inlet. ERTS MSS 4 and 5 images can be used in this area to plot sediment and pollutant trajectories, areas of probable commercial fish concentration, and the circulation regime. (See also W74-06619) (Knapp-USGS)
W74-06670

SEDIMENT DISTRIBUTION AND COASTAL PROCESSES IN COOK INLET, ALASKA,
Cold Regions Research and Engineering Lab., Hanover, N.H.
D. M. Anderson, L. W. Gatto, H. L. McKim, and A. Petrone.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1323-1339, 1973. 7 fig, 13 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Estuaries, *Alaska, Water circulation, Path of pollutants, *Sediment transport, Mixing, Data collections, Glacial drift, Tides, Sedimentation, Erosion, Currents(Water).
Identifiers: *ERTS, *Cook Inlet(Alas).

Regional hydrologic and oceanographic relationships in Cook Inlet, Alaska, were recognized from sequential ERTS-1 MSS imagery. Coastline configuration is well defined on bands 6 and 7. Current patterns are visible in the inlet because of differential concentrations of suspended sediment. These patterns are most evident on bands 4 and 5. The circulation patterns are controlled primarily by the interaction between the semidiurnal tides and the counterclockwise Alaska current. Tongues of clear oceanic water enter the inlet through Kennedy Channel along the east shoreline in the vicini-

ty of Cape Elizabeth. A counterclockwise circulation pattern around Kalgin Island results from the interplay of the northerly moving water along the east shore and the southerly moving water along the west side of the inlet. Freshwater plumes heavily laden with sediment are visible at the mouths of all major rivers. Relect plumes from as many as three tidal stages have been recognized. Tidal flats and a number of unmapped cultural features appear prominently in bands 5 and 6. (See also W74-06619) (Knapp-USGS)
W74-06671

DISTRIBUTION AND MOVEMENT OF SUSPENDED SEDIMENT IN THE GULF OF MEXICO OFF THE TEXAS COAST,
Geological Survey, Corpus Christi, Tex.
R. E. Hunter.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1341-1348, 1973. 4 fig, 4 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Turbidity, *Gulf of Mexico, Sediment transport, Suspended load, Provenance, Ocean circulation, Ocean currents, Littoral drift, Data collections, *Texas.
Identifiers: *ERTS.

ERTS-1 imagery is very useful in studies of the distribution of suspended sediment in the Gulf of Mexico off the Texas coast. By using suspended-matter concentrations as tags on water masses, much information on water movement can be obtained. Superimposed on the general offshore decrease in turbidity are more complex concentrations of turbid water which may be classified as plumes or bands. A plume is attached to its source river or inlet during its growth, but at the end of an ebb tidal cycle, the plume from a tidal inlet becomes detached and drifts passively. Most bands are aligned either parallel or obliquely to shore. The bands may originate in several ways: by drift along streamlines from localized sources, such as river mouths, where suspended sediment is being continuously supplied; by the deformation of ebbtide plumes after they have been detached from their source at a tidal inlet; or by the concentration of suspended sediment in the convergence or divergence zones between water masses, especially in the convergence or divergence zones associated with helical circulation cells. (See also W74-06619) (Knapp-USGS)
W74-06672

OCEANOGRAPHIC MAPPING OF STRUCTURE AND DYNAMICS OF THE NORTHERN GULF OF CALIFORNIA BY THE USE OF SPECTRAL MODELING AND ERTS-1,
Arizona Univ., Tucson.
L. K. Leply, G. Calderon, and J. R. Hendrickson.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1349-1356, 1973. 3 fig, 1 tab, 5 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Oceanography, *Ocean currents, Mapping, Surveys, Currents(Water), Data collections.
Identifiers: *ERTS, *Gulf of California.

Distribution and flow of water masses at four depth intervals were determined by analyzing ERTS imagery through the use of optical models of classes of vertical oceanographic profiles. Data used for these models were obtained from shipboard measurements (including surface spectral radiance) and optical and more conventional oceanographic depth profiles. The spectral models obtained were applied to radiance-contoured ERTS imagery in bands 4, 5, 6, and 7. Features mapped by direct photointerpretation of ERTS imagery include submerged shoals, current streamlines, and location of possible upwellings, downwellings and submarine springs. (See also W74-06619) (Knapp-USGS)
W74-06673

REMOTE SENSING OF OCEAN CURRENTS USING ERTS IMAGERY,
National Oceanic and Atmospheric Administration, Miami, Fla. Atlantic Oceanographic and Meteorological Labs.
G. A. Maul.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1365-1375, 1973. 4 fig, 10 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Oceanography, *Ocean currents, *Gulf of Mexico, Currents(Water), Ocean circulation, Plankton, Waves(Water), Algae, Turbidity, Data collections, Pollutant identification.
Identifiers: *ERTS.

Major ocean currents such as the Loop Current in the eastern Gulf of Mexico have surface manifestations which can be detected by remote sensing. Surface chlorophyll-a concentrations, which contribute to the shift in color from blue to green in the open sea, have high spatial variability; significantly lower concentrations were observed in the current. The cyclonic edge of the current is an accumulation zone which causes a peak in chlorophyll concentration. The dynamics also cause surface concentrations of algae, which have a high reflectance in the near infrared. Combining these observations gives rise to an edge effect which can show up as a bright lineation on multispectral imagery. Frequently the sea-state in the current is higher than in surrounding water due to differential shear. When high seas introduce bubbles, white caps, and foam, the reflectance is dominated by scattering rather than absorption. This has been detected in ERTS imagery and used for current location. (See also W74-06619) (Knapp-USGS)
W74-06675

APPLICATION OF ERTS-1 IMAGERY TO THE HARVEST MODEL OF THE U.S. MENHADEN FISHERY,
Earth Satellite Corp., Washington, D.C.
P. M. Maughan, A. D. Marmelstein, and O. R. Temple.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1405-1411, 1973. 3 fig.

Descriptors: *Remote sensing, Satellites(Artificial), *Fisheries, *Gulf of Mexico, Turbidity, Plankton, Shoals, Data collections.
Identifiers: *ERTS, *Menhaden.

ERTS-1 imagery was evaluated for providing information for the harvest model of the menhaden industry. The unexpected complexity of the physical environment in Mississippi Sound precluded simplistic analysis of fish-environment relationships. Preliminary indications are that an association does exist between fish availability and differences in water transparency (turbidity) within the Sound. A clearer relationship is developing between major turbid features imaged by ERTS-1 and location of successful fishing attempts. Overlays of catch location on ERTS-1 images show an association of school position with interfaces between imaged turbid features. (See also W74-06619) (Knapp-USGS)
W74-06678

COASTAL AND SUBMARINE FEATURES ON MSS IMAGERY OF SOUTHEASTERN MASSACHUSETTS: COMPARISON WITH CONVENTIONAL MAPS,
Geological Survey, Reston, Va. EROS Program Office.
R. S. Williams, Jr.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1413-1422, 1973. 5 fig, 1 tab, 6 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Mapping, *Coasts, *Geomorphology, Topographic mapping, Geologic mapping, Data collections, Data processing, Beaches, Erosion, Sedimentation, *Massachusetts.
Identifiers: *ERTS.

Three ERTS-1, MSS images of southeastern Massachusetts, including Cape Cod Bay, Cape Cod, and Nantucket Sound, show a variety of dynamic geologic and hydrologic phenomena. Coastal features imaged include the coastline at different times in the tidal cycle, harbors, lakes and ponds, marshes (wetlands), and beach and dune areas; submarine features include tidal flats, shoals, natural channels, and bars. Comparisons with conventional maps at 1:1,000,000 and 1:250,000,000 scales show many inaccuracies between the ERTS imagery and the maps. The discrepancies are caused by cartographic generalization from larger scale maps and, in some instances, actual changes in landforms. The marine geological information shown on the ERTS imagery is not shown on the 1:1,000,000- or 1:250,000,000-scale maps, nor is other mappable environmental information. The ERTS-1 imagery provides coastal and submarine information superior to conventional maps at 1:250,000 or smaller scales. The ERTS-1 imagery can be used to increase the accuracy of maps, portray additional environmental information, and provide the capability for frequent updating of maps. (See also W74-06619) (Knapp-USGS)
W74-06679

WATER DEPTH ESTIMATION WITH ERTS-1 IMAGERY,
International Imaging Systems, Mountain View, Calif.
D. S. Ross.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1423-1432, 1973. 5 fig, 5 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Oceanography, *Bathymetry, *Depth, Data collections, Mapping, Surveys, Sounding, Topography.
Identifiers: *ERTS.

Contrast-enhanced 9.5 inch ERTS-1 images were produced for an investigation on ocean water color. Such images lend themselves to water depth estimation by photographic and electronic density contouring. MSS-4 and -5 images of the Great Bahama Bank were density sliced by both methods. Correlation was found between the MSS-4 image and a hydrographic chart at 1:467,000 scale in a number of areas corresponding to water depth of less than 2 meters, 5 to 10 meters, and 10 to about 20 meters. The MSS-5 image was restricted to depths of about 2 meters. Where reflective bottom and clear water are found, ERTS-1 MSS-4 images can be used with density contouring by electronic or photographic methods for estimating depths to 5 meters within about one meter. (See also W74-06619) (Knapp-USGS)

W74-06680

DIGITAL DATA PROCESSING OF ERTS-1 IMAGERY OF DELAWARE BAY,
Bendix Aerospace Systems Div., Ann Arbor, Mich.
A. C. Conrod.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1641-1647, 1973. 3 fig.

Descriptors: *Remote sensing, Satellites(Artificial), *Data processing, *Estuaries, Data collections, Digital computers.
Identifiers: *ERTS, *Delaware Bay.

An Earth Resources Data Center is capable of automatically producing classification imagery and thematic maps from ERTS computer compatible tapes. ERTS coverage of Delaware Bay was processed to produce classification imagery of water masses in the bay, and a map of all land-water boundaries along the shoreline including wetlands and inland lakes. The results of processing may be obtained by personnel who are data users, and not data processing specialists. Any ERTS investigator can achieve precise and quantifiable results directly from taped data. (See also W74-06619) (Knapp-USGS)
W74-06703

UNSUPERVISED CLASSIFICATION AND AREAL MEASUREMENT OF LAND AND WATER COASTAL FEATURES ON THE TEXAS COAST,
Lockheed Electronics Co., Inc., Houston, Tex. Aerospace Systems Div.
L. M. Flores, C. A. Reeves, S. B. Hixon, and J. F. Paris.
In: Symposium on Significant Results Obtained from the Earth Resources TechnologySatellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1675-1681, 1973. 4 fig, 1 tab, 7 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Data processing, Coasts, Wetlands, Beaches, Forests, *Land use, Data collections, *Texas, Gulf of Mexico.
Identifiers: *ERTS.

ERTS-1 multispectral scanner (MSS) digital data were used to delineate coastal land, vegetative, and water features in two portions of the Texas Coastal Zone. Data were analyzed through the use of two clustering algorithms. Many classes were identified as pure features such as water masses, salt marsh, beaches, pine, hardwoods, and exposed soil or construction materials. Most classes were identified to be mixtures of the pure class types. Using an objective technique for measuring the percentage of wetland along salt marsh boundaries, an analysis was made of the accuracy of areal measurement of salt marshes. Accuracies ranged from 89% to 99%. NASA aircraft photography was used as the basis for determining the true areal size of salt marshes in the study sites. (See also W74-06619) (Knapp-USGS)
W74-06706

USE OF ERTS-1 PICTURES IN COASTAL OCEANOGRAPHY IN BRITISH COLUMBIA,
Department of the Environment, Victoria (British Columbia). Marine Sciences Branch (Pacific Region).
J. F. R. Gower.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1683-1684, 1973.

Descriptors: *Remote sensing, Satellites(Artificial), *Oceanography, Water circulation, *Canada, Data collections, Coasts, Data processing, Path of pollutants, Ocean currents, Turbidity, *Pollutant identification.
Identifiers: *ERTS, *British Columbia.

The ERTS-1 color composite picture of the Vancouver-Victoria region illustrates the value of ERTS data for coastal oceanography. The water of the Fraser River plume which is clearly visible in the center of the scene has been of interest to oceanographers on the west coast of Canada for a long time as an easily visible tracer of surface water circulation in the Strait of Georgia. The ERTS satellite gives the first complete view of the plume area. Electronic enhancement of the images shows that the satellite's narrow angle coverage allows very weak surface turbidity features to be made visible to give information on surface currents over a wide area. W74-06707

APPLICATION OF ERTS-1 IMAGERY IN COASTAL STUDIES,
Army Engineer Div. South Pacific, San Francisco, Calif. Coastal Engineering Branch.
O. T. Magoon, D. W. Berg, and R. J. Hallermeier.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1697-1698, 1973.

Descriptors: *Remote sensing, Satellites(Artificial), *Oceanography, Navigation, Sediment transport, Path of pollutants, Coasts, Littoral drift, Sea ice, Ocean currents, Data collections, Data processing, *Pollutant identification, *Turbidity.
Identifiers: *ERTS.

Study of the ERTS image of each spectral band separately, in combination with other bands, and in conjunction with other available data permits extraction of data useful in coastal engineering planning and coastal processes studies. An MSS 5 image of August 16, 1972, clearly defines the configuration of Indian River Inlet, Delaware. The offset between the barrier islands north and south of the inlet gives an indication of predominant south-to-north longshore littoral transport at the inlet. In general, sediment plumes emanating from an inlet may be discernible in MSS 4 or MSS 5 and may give some indication of longshore transport direction at the time of the image. Nearshore flow patterns may be traced using the recorded suspended sediment patterns in ERTS imagery. An ERTS image of Lituya Bay, Alaska, obtained on September 18, 1972, shows a well-defined plume of turbid water associated with the Alsek River. Water flow to the northwest may be inferred from this plume's shape. ERTS imagery of the Laptev Sea coastline on the northern shore of Siberia on September 16, 1972, shows important fluid mixing phenomena. A mosaic of MSS 4 images displays a convoluted interface between waters of markedly different turbidities. A mosaic of MSS 4 images of the mouth of the Colorado River (September 30, 1972) slightly overlaps a mosaic of MSS 4 images of a region slightly further south in the Gulf of California (September 29, 1972). The structure of the complex suspended sediment pattern in the overlap area is quite different on the two days. (See also W74-06619) (Knapp-USGS)
W74-06709

DETECTION OF TURBIDITY DYNAMICS IN TAMPA BAY, FLORIDA USING MULTISPECTRAL IMAGERY FROM ERTS-1,
Geological Survey, Tampa, Fla.
A. E. Coker, A. Higer, and C. R. Goodwin.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1715-1726, 1973. 5 fig.

Descriptors: *Remote sensing, *Data collections, Satellites(Artificial), *Turbidity, Dredging, Harbors, Bays, *Florida, Simulation analysis, Mathematical models, Data processing, Water circulation, Path of pollutants, *Pollutant identification.
Identifiers: *ERTS, *Tampa Bay(Fla).

In order to determine the effects of deepening of Tampa Bay on circulation, water quality, and biota during and after the construction, a digital simulation model of the bay was developed, and data were collected by ERTS and conventional methods. Return-Beam Vidicon (RBV) multispectral data were collected while a shell dredging barge was operating in the bay, and used for turbidity recognition and unique spectral signatures representative of type and amount of material in suspension. The processed data integrated with other modeled parameters provide an overview of the dynamics of turbid material during dredging periods. A three-dimensional concept of the dynamics of the plume was achieved by superimposing the parts of the plume recognized at each RBV band. This provides a background for automatic computer processing of ERTS data and three-dimensional modeling of turbidity plumes. (See also W74-06619) (Knapp-USGS)
W74-06711

NUMERICAL MODEL OF ST. LAWRENCE RIVER ESTUARY,
Institute of Coastal Oceanography and Tides, Birkenhead (England).
D. Prandle, and N. L. Crookshank.
Journal of the Hydraulics Division, American Society of Civil Engineers Vol 100, No HY4, Paper 10472, p 517-529, April 1974. 10 fig, 4 ref, append.

Descriptors: *Estuaries, *St. Lawrence River, *Numerical analysis, *Tides, Bores, *Mathematical models, Rivers, Stratified flow, Saline water intrusion, Water circulation, Coriolis force.

A numerical scheme of tidal propagation involves an explicit fine-difference solution to the shallow-water wave equations. This model was combined with one-dimensional models of the higher reaches of the St. Lawrence and Saguenay Rivers. The resulting model represents a complete simulation of the estuary to the limits of the tidal influence. Computed values of the depth-averaged velocities showed good agreement with field recordings of surface velocities in the upstream section of the lower estuary. However results in the downstream section indicated the magnitude of the computed velocities to be lower than the recorded surface velocities. This inconsistency is related to the degree of the vertical density stratification in the estuary. The influence of the Coriolis force on the flow in the lower estuary was also studied; it has a significant effect at long time-scales. (Knapp-USGS)

THE PRESENT AND FUTURE STATUS OF EASTERN NORTH CAROLINA WETLANDS,
North Carolina Univ., Chapel Hill. Dept. of Geography.
A. J. Hawley.
Available from the National Technical Information Service as PB-231 486, $5.00 in paper copy, $1.45 in microfiche. North Carolina Water Resources Research Institute, Raleigh, UNC-WRRI Report No. 87, January 1974. 169 p. OWRR A-053-NC(1).

Descriptors: *Wetlands, *Coastal marshes, Freshwater marshes, Land tenure, Management, *North Carolina, Coastal plains, *Estuarine environment, *Regulation, Water quality control, Preservation, Drainage, Dredging, Forestry, Fisheries, Wildlife, Recreation.
Identifiers: *Wetlands protection.

Alteration and destruction of North Carolina wetlands are proceeding rapidly. Moreover, State dredge and fill regulations apply only to coastal wetlands and state-owned lakes, whereas estimates indicate that these areas account for less than six percent of all wetlands in eastern North Carolina. Despite its losses North Carolina ranks first among all states on the eastern seaboard in the extent of important estuarine area remaining. The State also leads in the acreage of estuarine habitat preserved or proposed for preservation. North Carolina has 5,885,000 acres of wetlands with 95 percent located in the coastal plain counties. In the late 1950's private individuals, companies and corporations owned all wetland acreages in 27 of these 41 coastal plain counties. Highly conservative estimates indicated that over 72 percent of the coastal marshlands were privately owned whereas 56 percent of inland wetlands were in private ownership. Under the assumption that some wetland areas are worth preserving, this study identifies and maps wetland areas considered important by some 200 knowledgeable field interviewees from four subject-oriented perspectives: (1) forestry, (2) fisheries, (3) wildlife, and (4) recreation. The report concludes with recommendations for a State program for wetland protection. (McJunkin-North Carolina)

COOPERATIVE GULF OF MEXICO ESTUARINE INVENTORY AND STUDY, FLORIDA: PHASE I AREA DESCRIPTION,
National Marine Fisheries Service, St. Petersburg Beach, Fla. Gulf Coast Fisheries Center.
J. K. McNulty, W. H. Lindall, Jr., and J. E. Sykes.
Available from the National Technical Information Service as COM-73-50277, $1.45 microfiche. November 1972. 137 p, 86 tab, 60 map, 3 chart, 1 illus, 1 bibl.

Descriptors: *Florida, *Coasts, *Estuaries, *Tidal marshes, *Gulf of Mexico, Mangrove swamps, Fisheries, Shellfish, Pollution, Public health, Water temperature, Salinity, Streamflow, Artificial substrates, Commercial fishing.

Newly-developed tables and maps depict the dimensions, submerged vegetation, tidal marshes, mangrove swamps, commercial oyster beds, leased oyster-rearing areas, sources of pollution, drained tidal marshes, and filled areas of Florida's west coast estuaries. Published and unpublished information on temperature, salinity, geology, artificial fishing reefs, stream discharge, human population, commercial fishing, and economic development is presented in new form. Human population in coastal counties increased from 614,616 persons. in 1930 to 3,320,226 persons in 1970. This increase resulted in adverse effects from pollution to 43% of estuarine areas, in the filling of 23,521 acres mainly for residential and industrial development, and in the draining of 26,676 acres of tidal marshes for mosquito control. The increasing population correlates directly with the number of sources of pollution, filled area, and the area closed to shellfishing by public health authorities. Thus, failure to control the adverse effects of population growth will clearly result in continued rapid degradation of estuarine habitat on Florida's west coast. (Conko-Florida)

ECOLOGICAL ASPECTS ALONG THE SHORES OF THE BURABALANGA TIDAL ESTUARY BALASORE DISTRICT, ORISSA STATE,
Botanical Survey of India, Calcutta.
T. A. Rao, and A. K. Mukherjee.
Proc Indian Acad Sci Sect B. Vol 76, No 5, p 201-206. 1972.
Identifiers: Ecological studies, *Estuaries, *India(Burabalanga), Precipitation, Soils, *Tidal estuary.

A few terrestrial strips of the Burabalanga (India) tidal estuary were studied both for their taxa and soil. There is a distinct change in the vegetational patterning and species composition from the stabilized estuarine shore towards the upland relief. With increasing distance from the estuarine shore line, the cover percentage decreased. Similarly, the edaphic parameters show significant differences and show correlation both negative and positive in response to tidal rhythms within a broad topo-sequence. It is concluded that the cause for the sequential changes of taxa and soil correspond roughly to tidal floodings on the intertidal areas and the combined action of precipitation (climate) and local topography on the supratidal area.--Copyright 1973, Biological Abstracts, Inc

BAKING QUALITY OF SPRING WHEAT AS AFFECTED BY RAIN DURING DRYING AFTER REAPING (IN POLISH),
Wyzsza Szkola Rolnicza, Wroclaw (Poland). Instytut Hodowli Roslin i Nasiennictwo.
M. Zamorska.
Hodowla Rosl Aklim Nasienn. Vol 16, No 2, p 107-122. 1972. Illus. (English summary).
Identifiers: Drying, Rain, Reaping, *Wheat(Spring), *Poland, *Grain harvesting.

Seven spring wheat varieties were studied over 5 yr. Grain harvested during a rainless spell did not differ significantly from that harvested after with regard to 1000 seed weight, protein content and water-absorbing capacity of flour. Bread and dough characteristics depended to a certain degree on date of harvest, which was related to rainfall. Bread made of grain slightly affected by rain had a greater volume compared to that made of grain harvested during a rainless spell. Bread volume was smaller when grain was subjected to rain for a longer time. Identical or greater dough elasticity and slight softening of dough were characteristic of grain slightly affected by rain compared to that harvested during a rainless spell.--Copyright 1973, Biological Abstracts, Inc.

WHEAT AND GRAIN SORGHUM IRRIGATION IN A WIDE BED-FURROW SYSTEM,
Agricultural Research Service, Bushland, Tex.
R. R. Allen, and J. T. Musick.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 15, No 1, p 61-63, January-February, 1972. 4 fig, 1 tab, 7 ref.

Descriptors: *Irrigation practices, *Furrow irrigation *Irrigation design, Irrigation efficiency, Irrigation, Infiltration rates, *Wheat, *Grain sorghum, Agricultural engineering, *Texas.
Identifiers: Row crops, Wide-bed furrows, Southern High Plains.

A wide bed-furrow system was tested for irrigation of winter wheat and grain sorghum on a slowly permeable clay loam in the Southern High Plains. The system consisted of 60-inch spaced furrows separating relatively broad flat beds about 40 inches wide. Wheel traffic zones were maintained along the center of the beds separate from water furrows. The wide bed-furrow system was compared with conventional 40-inch bed-furrows where wheel traffic occurs in irrigation furrows. Beds and furrows were maintained in place during a second crop by no-till seeding grain sorghum after wheat and using chemical weed control. The wide bed-furrow system was successfully managed for production of both winter wheat and grain sorghum. Yields from 60-inch bed-furrows were similar to those from the 40-inch spacing. Water intake during irrigation of wide bed-furrows on the 1,000-foot length of run was similar to 40-inch conventional bed-furrows during a winter irrigation of wheat but averaged 23 percent less during three spring irrigations, and 19 percent less during two seasonal irrigations of grain sorghum. (Skogerboe-Colorado State)
W74-06580

MATHEMATICAL MODEL OF WATER ADVANCE IN BORDER IRRIGATION,
Washington State Univ., Pullman. Dept. of Agricultural Engineering.
D. L. Bassett.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 15, No 5, p 992-995, September-October, 1972. 3 fig, 12 ref.

Descriptors: *Model studies, *Surface irrigation, *Border irrigation, Irrigation practices, *Mathematical models, Computer models, Infiltration rates, Agricultural engineering, *Unsteady flow.
Identifiers: Water advance.

A mathematical model is presented which describes the advance of water over a dry porous bed as in border irrigation. The model uses the complete equations of continuity and motion for unsteady spatially varied flow. These are solved by the method of characteristics, with an external shape function and volume balance technique for advancing the tip. Computed solutions are compared with laboratory and field tests. Results suggest the model will predict flow with accuracy acceptable for most field use and comparable to that with which input data are described. (Skogerboe-Colorado State)
W74-06582

HYDRAULICS OF A CENTER PIVOT SYSTEM,
South Dakota State Univ., Brookings. Dept. of Agricultural Engineering.
S. T. Chu, and D. L. Moe.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 15, No 5, p 894-896, September-October, 1972. 3 fig, 1 tab, 4 ref.

Descriptors: *Fluid mechanics, *Pipe flow, *Head loss, Irrigation practices, Sprinkler irrigation, Hydraulics, Closed conduits, Pressure conduits, Water distribution(Applied), Application methods.
Identifiers: *Center pivot system.

The analytical solutions for the total pressure head loss and the distribution of pressure head loss along the mainline of a center pivot system are presented. It is shown that the theoretical results are good approximations of practical field situations. (Skogerboe-Colorado State)
W74-06583

DESIGN CRITERIA FOR IRRIGATION SYSTEMS WITH COMPLEX PIPE LOOPS,
Nebraska Univ., Lincoln. Coll. of Engineering and Architecture.
D. M. Edwards, and B. Spencer.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 15, No 1, p 76-78, January-February, 1972. 3 fig, 1 tab, 7 ref.

Descriptors: *Irrigation engineering, *Irrigation design, *Sprinkler irrigation, *Pipe flow, Pipelines, Hydraulics, Fluid mechanics, Irrigation systems, Irrigation practices, *Design criteria.
Identifiers: *Loop networks.

A design procedure is presented for the analysis of irrigation systems utilizing loop networks. The design of these systems is readily adapted to the digital computer. With the advent of solid set sprinkler, subsurface, and trickle irrigation systems the simple system layout may no longer be an adequate design. In these cases loop networks will lower fixed and operation irrigation costs while developing better water distribution by maintaining more uniform pressures throughout the system. This design procedure has been used successfully in actual field installations. It should be emphasized that although the procedure produces very reliable results, the results of the entire analysis are only as good as the initial selection of inputs and outputs and human judgments. (Skogerboe-Colorado State)
W74-06585

DEVELOPMENT OF ASPHALT MOISTURE BARRIER EQUIPMENT,
International Harvester Co., Hinsdale, Ill.
R. C. Fischer.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 15, No 4, p 630-631, July-August, 1972. 2 fig, 6 ref.

Descriptors: *Soil moisture, *Asphalt, *Linings, Soil asphalt, Moisture availability, Deep percolation, Groundwater movement, Root zone.
Identifiers: *Moisture barriers.

Prototype equipment for installation of asphalt water barrier under sandy farmland has attained rates of 1 1/4 acres per hour. Installation requires a tractor of 200 horsepower and 1000 gallons of asphalt per acre. Predictions show that some vegetable crops will return the installation price of $250 per acre within three years. Some corn areas have taken five years. Asphalt barrier will conserve water and plant nutrients from leaching and reduce stream pollution. Asphalt barrier may become a significant factor in increasing the world food supply. (Skogerboe-Colorado State)
W74-06586

EVALUATION OF A FURROW MODIFYING DEVICE,
Agricultural Research Service, Auburn, Ala.
W. R. Gill.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 15, No 3, p 401-403, May-June, 1972. 5 fig, 3 tab, 2 ref.

Descriptors: *Soil treatment, *Cultivation, *Soil management, Soil physics, Soil texture, Soil properties, Evaluation, *Furrow irrigation.
Identifiers: *Plowing.

A study of the modification of a furrow slice indicates that a two-phase isolation and shearing of the soil slice may reduce the draft of a plow in cer-

tain soil conditions. The observed effect may be achieved by a reduction of compaction hardening or a partial loosening of the slice. While the undercutting and plowing of the slice may be done in separate operations it would appear that they can be simultaneously undertaken in a single operation if suitable space is provided between the tools. The forces on a plow may be beneficially altered by varying the parameters of an integrally mounted undercutting device. The use of a cutter reduces large lateral forces on plows. (Skogerboe-Colorado State)
W74-06588

DEEP PLOWING - AN ENGINEERING APPRAISAL,
Agricultural Research Service, Beltsville, Md.
P. E. James, and D. E. Wilkins.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 15, No 3, p 420-422, May-June, 1972. 5 fig, 4 tab, 4 ref.

Descriptors: *Cultivation, *Soil management, *Deep tillage, Farm management, Root zone, Soil treatment, Radioactivity, *Cost-benefit analysis.
Identifiers: *Deep plowing.

Tests to determine the benefits and costs of deep plowing were conducted under six different sets of conditions. Questions to be answered were: limitations of deep plowing, power requirements, plow modifications needed, and soil burial pattern. Results ranged from almost no benefit to nearly double yields. Answers to the questions are as varied as the field conditions. The need for deep plowing should be evaluated at each location. It is not a solution to all problems. (Skogerboe-Colorado State)

A SIMULATED ENVIRONMENTAL MODEL OF TEMPERATURE, EVAPORATION, RAINFALL, AND SOIL MOISTURE,
Agricultural Research Service, State College, Miss.
J. W. Jones, R. F. Colwick, and E. D. Threadgill.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 15, No 5, p 366-372, March-April, 1972. 8 fig, 2 tab, 24 ref.

Descriptors: *Environment, *Computer models, *Plant growth, Plant-Soil-Water relationships, Model studies, *Soil moisture, Climatic data, Precipitation(Atmospheric), Environmental effects, *Simulation analysis, *Crop production, Temperature, Soil moisture.

An environment model was developed for crop production or other biological systems to provide inputs of daily rainfall, temperature, evaporation, and soil moisture variations with depth. The weather model was run on the computer and 10 years of simulated data were shown to compare very closely with observed data for State College. The soil moisture model produced results that fell within 10 percent of the observed data for at least 43 days. The models can be used to provide basic environmental variables for use in crop production simulations for studying complete systems at various locations. The methods of simulation developed show promise for studying and projecting environmental factors. (Skogerboe-Colorado State)

HYDRODYNAMICS OF BORDER IRRIGATION ADVANCE,
Nebraska Univ., Mitchell. Scotts Bluff Experiment Station.
D. C. Kincaid, D. F. Heermann, and E. G. Kruse.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 15, No 4, p 674-680, July-August, 1972. 14 fig, 1 tab, 10 ref.

Descriptors: *Irrigation practices, *Irrigation design, *Border irrigation, *Infiltration rates, Irrigation systems, Computer models, Application methods, Crop production, Agricultural engineering, *Mathematical models, Flow, Mannings equation.

A mathematical model simulating border irrigation was developed by numerically solving the hydrodynamic equations of overland flow. A power law infiltration function is used and the resistance is calculated by Manning's equation. The advance rate is controlled by the overall volume balance of the system. The moving boundary is the locus of points at some arbitrary depth. Comparisons of the model with experimental advance data, surface hydrographs and surface storage volume curves show that the model simulates border flow reasonably well with a resistance function of the form of Manning's equation. The model will describe advance for any specified inflow conditions whenever the slope, infiltration and resistance properties of the border are known. (Skogerboe-Colorado State)

SPRINKLER PRECIPITATION GAGE ERRORS,
Agricultural Research Service, Kimberly, Idaho. Snake River Conservation Research Center.
R. A. Kohl.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 15, No 2, p 264-265, 271, March-April, 1972. 2 fig, 1 tab, 7 ref.

Descriptors: *Irrigation practices, *Sprinkler irrigation, *Precipitation gages, Uniformity coefficient, *Evaporation control, Evaporation.

Different types of precipitation gages have been tried with sprinkler irrigation. The main problem encountered has been that of evaporation losses from the container. Covering the water with oil had little effect since much of the evaporation took place from droplets clinging to the walls above the oil. A 250 milliliter separatory funnel filled with oil was tested and found to be quite successful. As the water enters, the oil is displaced into another container. The problem of splash losses still exists with this method. (Skogerboe-Colorado State)
W74-06593

SOIL AND WATER LOSSES AS AFFECTED BY TILLAGE PRACTICES,
Agricultural Research Service, Brookings, S. Dak. Soil and Water Conservation Research Div.
C. A. Onstad.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 15, No 2, p 287-289, March-April, 1972. 1 fig, 6 tab, 8 ref.

Descriptors: *Soil conservation, *Water conservation, *Erosion control, Soil erosion, Agricultural runoff, *Cultivation, Mulching, Sediment control.

Four corn tillage treatments were compared with respect to their effect on soil and water losses in a 6-year study. The treatments tested were: conventional tillage, mulch tillage, till-planted up and down slope, and till-planted on the contour. Higher runoff on the conventionally tilled plots and lower runoff on the contoured till-plant treatment were significant at the 1-percent level. Runoff differences were not significant for the mulch-tilled and the till-planted up and down slope. The differences in soil loss were also significant in the same manner as runoff. These measurements were made on slope lengths of 72.6 ft. Longer slopes would have more soil loss per unit area. Extrapolated to a 300-foot slope length, the soil loss from the conventional treatment would have exceeded 5 tons per acre even though growing season rainfall was only 80 percent of normal. (Skogerboe-Colorado State)
W74-06595

PERFORMANCE OF A TILE DRAINAGE SYSTEM: AN EVALUATION OF A TILE DESIGN AND MANAGEMENT,
Agricultural Research Service, Urbana Ill
E. R. Perrier, A. J. MacKenzie, L. B. Grass, and H. H. Shull.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 15, No 3, p 440-444, May-June, 1972. 6 fig, 6 tab, 15 ref.

Descriptors: *Drainage, *Drainage effects, *Drainage practices, Drainage systems, Subsurface drainage, Tiles, Drainage area, Drainage engineering, Irrigation practices, Evaluation, Design.

Comparisons were made of the steady and unsteady-state drainage relations measured in the field to determine the performance and required management of an existing drainage system. The data were obtained from an 80 acre cotton field in California's Imperial Valley. The soil is a Holtville silty clay loam highly stratified, typical of the area. Various drainage design equations were compared to the measured data. Use of the tile lines for irrigation was also investigated. Results indicate that all of the equations only approximate the actual operation of the system. The use of the tile lines for irrigation showed promise. (Skogerboe-Colorado State)

DEEP PLOWING AND CHEMICAL AMENDMENT EFFECT ON A SODIC CLAYPAN SOIL,
Agricultural Research Service, Mandan, N. Dak.
F. M. Sandoval, J. J. Bond, and G. A. Reichman.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 15, No 4, p 681-684, 687, July-August, 1972. 4 fig, 5 tab, 13 ref.

Descriptors: *Soil management, *Deep tillage, *Soil amendments, Crop production, Cultivation, Soil properties, Soil chemistry, Soil profiles, Fallowing, Soils.
Identifiers: Deep plowing.

Deep plowing and chemical amendments improved a Solonetzic soil, increased barely yields, and substantially increased wheat yields under the dryland conditions of western North Dakota. The Rhoades silty clay loam, which had a shallow dense sodic claypan, was plowed to 6, 12, and 24-inch depths with and without soil amendments. Split plots were alternately fallowed and cropped for 5 years. Barley was grown 4 years and wheat on the 5th year. Crop yield increases attributed to deep plowing appeared to be associated with greater soil water availability for crop use and for soil leaching. Soil improvement was evidenced by the reduction of bulk densities and lessened saline sodic soil conditions. Hardness of the soil crust was reduced by deep plowing, and amendments further increased soil friability. The 5th year after deep tillage and amendment treatments, spring wheat yields were 1,170, 1,570, and 1,885 pounds per acre for the 6, 12, and 24-inch plowing depths respectively. PASTURE IRRIGATION WITH A CENTER PIVOT SPRINKLER SYSTEM,
Nebraska Univ., North Platte. Dept. of Agricultural Engineering.
B. R. Somerhalder, and D. C. Clanton.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 15, No 5, p 902-904, 908, September-October, 1972. 1 fig, 6 tab.

Descriptors: *Irrigation practices, *Sprinkler irrigation, *Pasture management, Carrying capac

ty, Forages, Pasture, Crop production, *Nebraska.
Identifiers: *Center-pivot sprinklers, Beef production.

Irrigated cool season pasture under a 52-acre center-pivot sprinkler system was grazed with beef cattle for two years at the University of Nebraska, North Platte Station. Three classes of animals -- cows and calves, yearlings, and weaned calves -- were grazed at different times during each year. Average investment and operating costs for two years of forage production was $126.04 per acre; average beef gain was 748 lb. per acre. This resulted in a feed cost of 16.8 cents per pound of gain. Utah State Univ., Logan. Dept. of Agricultural and Irrigation Engineering.
Dept. of Agricultural and Irrigation Engineering, Utah State Univ., UMC 41, Logan, Utah 84322, Price: $6.00. Utah State University Report 211 (d)-5, January 1974, 352 p. Compiled by: D. Polchow, M. J. Lindberg, and L.C. Gabrish.

Descriptors: *Bibliographies, *Management, *Farm management, Planting management, Land management, *Irrigation, *Agriculture, Soil management, *Water management(Applied), Administration, Water policy, *Foreign projects, Foreign research.

This bibliography is the compilation of all of the relevant book titles dealing with on-farm water located at Utah State University. To date, 9,132 titles are housed in component parts of the Merrill Library which are pertinent to on-farm water. This figure includes: 5,964 books catalogued by dewey decimal call number; 1,593 books housed in the archives and special collections section of the library; 1,593 government documents; 432 vertical file materials; 301 non-book microfilm, microfiche and motion pictures; and 88 maps. Holdings in other centers of information on campus have also been included in the bibliography. There are 1,634 titles in the Utah Water Research Laboratory, 450 titles in the Agricultural and Irrigation Engineering Department, and 193 titles on business law in the College of Business.

EVALUATION OF INFLUENCE OF AVAILABLE SOIL WATER STORAGE CAPACITY ON GROWING SEASON LENGTH AND YIELD OF TROPICAL PASTURES USING SIMPLE WATER BALANCE MODELS,
Commonwealth Scientific and Industrial Research Organization, Townsville (Australia). Div. of Tropical Pastures.
R. L. McCown.
Agric Meteorol. Vol 11, No 1, p 53-63, 1973. Illus.
Identifiers: Dry matter production, *Pastures(Tropical), Season, *Soil water, *Stylosanthes-Humilis, Water storage, Yield, *Water balance models, Simulation analysis.

The results of a comparative study of the soil water balance, plant water relations and dry matter production of pastures (Townsville stylo (Stylosanthes humilis L.)) on 3 soils with available water storage capacities of 75, 150 and 180 mm are reported. Differences among sites in growing season length varied 0-27% in the 4 yr of study. To enable sampling of a much larger number of years, the methods of systems analysis and simulation are used. The experimental data are used to test or to formulate simple models which are in turn used to simulate the growing season length and dry matter production in 60 yr for which rainfall records are available. The results of the simulation study portray the extreme variation in production among years in a seasonally dry tropical climate. While the advantage conferred by a soil storing 180 mm available water as opposed to 75 mm would be expected to be nil in 8 yr, the average increase in pasture yield expected in 70% of years would be 34%.--Copyright 1973, Biological Abstracts, Inc.

COMPETITIVE SAPROPHYTIC COLONIZATION BY FUSARIUM OXYSPORUM F. SP. VASINFECTUM,
Libya Univ., Tripoli.
M. S. El-Abyad, and Y. E. Saleh.
Trans Br Mycol Soc. Vol 60, No 2, p 187-195, 1973.
Identifiers: Cotton roots, Fusarium-oxysporum-F-Sp-vasinfectum, *Saprophytic colonization, Soils, *Fungus, Hydrogen ion concentration, *Soil moisture.

Saprophytic colonization by F. oxysporum Schl. f. sp. vasinfectum (Atk.) Snyder et Hansen was investigated under several environmental conditions. At low moisture levels (20 and 40% moisture-holding capacity), the fungus invaded and persisted in sterile soil if inoculated before its competitors. At 100% M.H.C. (moisture-holding capacity) the fungus failed to invade the soil, possibly because of antagonism by bacteria. On dead cotton roots the fungus behaved as a vigorous saprophyte at 10-30 C and at pH range 4.7-8.8. Saprophytic colonization of the roots by Fusarium in competition with some common fungi was tested at standard inoculum potentials. The fungus was highly invasive when inoculated simultaneously with or before its competitors but saprophytic colonization was reduced when some competitors were inoculated 2 days ahead.--Copyright 1973, Biological Abstracts, Inc.

ESTIMATES OF PRAIRIE PROVINCIAL WHEAT YIELDS BASED ON PRECIPITATION AND POTENTIAL EVAPOTRANSPIRATION,
Department of Agriculture, Ottawa (Ontario). Plant Research Inst.
G. D. V. Williams.
Can J Plant Sci. Vol 53, No 1, p 17-30. 1973. Illus.
Identifiers: *Canada, Equations, *Evapotranspiration, Prairie, *Precipitation(Atmospheric), Regression analysis, Transpiration, Variability, Weather, *Wheat yields.

Weather-based estimates of Alberta, Saskatchewan and Manitobe (Canada) wheat yields were made for the years 1952-67 by weighting estimates for 42 prairie crop districts according to the number of hectares of wheat per district. The crop-district estimates were computed from May-July monthly precipitation and estimated potential evapotranspiration (PE) data, and the preseason conserved precipitation, using regression equations derived separately for different parts of the prairies. In Saskatchewan, where semiarid climates predominate, variability of wheat yields is high and much of it can be attributed to weather variability. In the most humid province, Manitoba, the yield variation is smallest, and less of this variation can be explained using the weather data. Lack of uniformity in climate, soils, and the sizes of crop districts contributed to several analysis problems, one of which was a bias in the results, particularly in Alberta. Equations based on precipitation and PE were superior to those based on precipitation alone. The estimation procedures can be useful in connection with the transporting and marketing of grain, and in planning future land use.--Copyright 1973, Biological Abstracts, Inc.

4. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control Of Water On The Surface

PROCESSING, CHEMICAL COMPOSITION AND NUTRITIVE VALUE OF AQUATIC WEEDS,
Florida Univ., Gainesville. Water Resources Research Center.
L. O. Bagnall, R. L. Shirley, and J. F. Hentges.

Availability from NTIS as PB-231 207; $3.75 in paper copy, $1.45 in microfiche. Publication No 25, November 16, 1973. 55 p, 29 fig, 12 tab, 30 ref. OWRR A-017-FLA(2). 14-31-0001-3809.

Descriptors: Drying, Chemical analysis, *Nutrients, Digestion, *Aquatic weeds, *Water hyacinth, *Rooted aquatic plants, Animal physiology, Toxins, Feeds, *Forages, Chemical properties, Florida.

As an alternative to chemical control, water hyacinth (Eichhornia crassipes) and hydrilla (Hydrilla verticillata) can be converted to agriculturally useful products. Whole or chopped plants can be readily composted to create an organic material for potting plants. The 90 to 95% moisture content plants can be pressed to remove 75% of the water with a modest energy input. The pressed plants can be ensiled with suitable additives or dried to make animal feed. Projected best processing costs are $2.50 per ton of hyacinth silage, $11.21 per ton of dried hyacinth and $8.40 per ton of dried hydrilla. Protein contents range from 12 to 18% and ash-free crude fiber contents range from 25 to 35%, which are in the range usually found in land forages. Ash concentrations of 10 to 30% were found, which are much higher than those found in land forages. Nitrates, oxalates and cyanide found in the aquatic plants were in ranges considered to be safe in usual land forages. Calcium to phosphorous ratios were at the high end of the satisfactory range and beyond. Dried pelleted water hyacinth has a replacement value equivalent to cotton seed hulls and sugar cane bagasse. Animal acceptability of properly made hyacinth silage was very good. Animal utilization of protein was poor and that of other nutrients was fair for both dried and ensiled water hyacinth. Identifiers: *Land grading.

The analysis presented can be used on all digital computers. Solutions to the program for reshaping the surface of the land resulted in a large savings in cost and time as compared to the trial-and-error procedure without the computer. It also made available the possibility of analyzing the same data with various sets of input restrictions. However, certain limitations are imposed when using this program: (1) Only rectangular areas are adaptable to this program. (2) The entire final surface of the bench is graded to a uniform plane. (3) The digital computer divorces all factors of human judgment from the solution. Human judgment is the key to successful design when applied before data reach the computer. CHANGE IN LAND USE IN THE PHOENIX (1:250,000) QUADRANGLE, ARIZONA BETWEEN 1970 AND 1972: SUCCESSFUL USE OF A PROPOSED LAND USE CLASSIFICATION SYSTEM,
Geological Survey, Washington, D.C. Geographic Applications Program.
J. L. Place.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 899-906, 1973. 4 fig.

Descriptors: *Remote sensing, Satellites(Artificial), *Mapping, *Land use, *Arizona, Urbanization, Grazing, Farms, Planning, Data collections, Data processing, Land classifcation.
Identifiers: *Phoenix(Ariz), *ERTS.

Changes in land use in the Phoenix (1:250,000 scale) Quadrangle in Arizona were mapped using only the images from ERTS-1 to verify the utility of a land use classification system proposed for use with ERTS images. The period of change investigated was from November 1970 to late summary or early fall, 1972. Seasonal changes also were studied using successive ERTS images. Types of changes detected are cropland or rangeland developed for new residential areas; rangeland converted to new cropland; and possibly new ares of industrial or commercial development. The ERTS images focus attention on those areas of greatest change requiring more intensive study. (See also W74-06619) (Knapp-USGS)

LAND USE INVESTIGATIONS IN THE CENTRAL VALLEY AND CENTRAL COASTAL TEST SITES, CALIFORNIA,
California Univ., Santa Barbara. Geography Remote Sensing Unit.
J. E. Estes.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1 Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 907-914, 1973. 1 fig, 1 tab.

Descriptors: *Remote sensing, Satellites(Artificial), *Mapping, *Surveys, *Land use, Farms, Grazing, Planning, Urbanization, *California, Data collections, Data processing.
Identifiers: *ERTS.

ERTS-1 data can be a valuable source for environmental resource information needs. The resolution of ERTS-1 data places constraints upon the detail to which specific environmental phenomena can be investigated. Furthermore, resolution limitations create certain problems for investigation of environments in which a diversity of phenomena are localized in small areal units. These limitations, however, are mitigated to a large degree through the synoptic perspective afforded by ERTS-1. The advantage of this synoptic view is that large-scale environmental resource information can be obtained within a standardized format for a single date and monitored with comparative ease to reflect changing resource conditions. In the Central Valley and Central Coastal test sites California, urban areas can be differentiated best on MSS bands 4 and 5; transportation linkages are most readily defined from MSS band 7; agricultural field boundaries are adequately identifiable on MSS bands 4-7, and most clearly defined on band 7; and cultivated land can be mapped accurately from MSS band 5. LAND USE IN NORTHERN COACHELLA VALLEY,
California Univ., Riverside. Dept. of Geography.
J. B. Bale, and L. W. Bowden.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1 Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admi Rept NASA SP-327, p 915-922, 1973. 3 fig, 5 ref.

Descriptors: *Remote sensing, Satellites(Artificial), Mapping, *Surveys, *Land use, Farms, Grazing, Planning, Urbanization, *California, Data collections, Data processing.
Identifiers: *ERTS, *Coachella Valley(Calif).

ERTS-1 imagery has great utility for monitoring land use change and as a data source for regional planning. In California, open space desert resources are under severe pressure to serve as a source of recreation for the heavily populated southern coastal plain. The northern half of the Coachella Valley has historically served as a focal point for weekend recreational activity and second homes. Since demand in this area has remained high, land use change from rural to urban residential has been occurring continuously since 1968. This area of rapid change is an ideal site to illustrate the utility of satellite imagery as a data source for planning information. (See also W74-06619) (Knapp-USGS)
W74-06624

LAND USE CLASSIFICATION AND CHANGE ANALYSIS USING ERTS-1 IMAGERY CARETS,
Geological Survey, Washington, D.C. Geographic Applications Program.
R. H. Alexander.
In: Symposium on Significant Result Obtained from the Earth Resources Technology Satellite Vol 1--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 923-930, 1973. 7 fig, 1 tab.

Descriptors: *Remote sensing, Satellites(Artificial), *Mapping, *Land use, Urbanization, Farms, Forests, Streams, Lakes, Beaches, *Virginia, Data collections, Data processing, Land classification.
Identifiers: *ERTS, *Norfolk(Va).

ERTS imagery in the Central Atlantic Regional Ecological Test Site area was examined to determine what categories of land use could be detected, and to what extent land use change could be identified and mapped. Land use detail exceeds the expectations of the Interagency Steering Committee and the USGS proposed standardized classification. Significant land use changes totaling 39.2 sq km in the Norfolk-Portsmouth SMSA were identified and mapped using a combination of procedures employing ERTS and high-altitude aircraft data. (See also W74-06619) (Knapp-USGS)
W74-06625

ERTS REGIONAL-SCALE OVERVIEW LINKING LAND USE AND ENVIRONMENTAL PROCESSES IN CARETS,
Geological Survey, Washington, D.C. Geographic Applications Program.
R. H. Alexander.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 931-937, 1973. 3 fig, 1 tab.

Descriptors: *Remote sensing, Satellites(Artificial), *Mapping, *Land use, Urbanization, Farms, Forests, Streams, Lakes, Beaches, *Virginia, Data collections, Data processing.
Identifiers: *ERTS.

A mosaic of ERTS images of the Central Atlantic Regional Ecological Test Site was used to partition the region into zones on the basis of similarity of tones and textures visible at a regional-scale overview. The resulting patterns were compared with existing small-scale maps of the region representing relief, land surface forms, geology, soils, vegetation, forest types, and land use. The ERTS-derived zones most closely resemble the patterns on the small-scale land use map, suggesting that land use is an indicator or resultant surface expression of several interacting environmental processes. These results lend support to a model of interdisciplinary regional analysis in which data on land use and land use change become the basic data entry into a regional information system to serve regional planners and land managers. (See also W74-06619) (Knapp-USGS)
W74-06626

EVALUATION OF LAND USE MAPPING FROM ERTS IN THE SHORE ZONE OF CARETS,
Viginia Univ., Charlottesville. Dept. of Environmental Sciences.
R. Dolan, and L. Vincent.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 939-948, 1973. 3 fig, 1 tab.

Descriptors: *Remote sensing, Satellites(Artificial), *Mapping, *Land use, Urbanization, Farms, Forests, Streams, Lakes, Beaches, *Virginia, Data collections, Data processing.
Identifiers: *ERTS.

ERTS imagery of the Atlantic shoreline zone of the Central Atlantic Regional Ecological Test Site was evaluated for classifying land use and land cover, employing the USGS Geographic Application Programs's land use classification system. ERTS data can provide a basis for land cover and land use mapping within the shoreline zone. Because of the dynamic nature of this environment, two additional terms are considered: vulnerability to storms and progressive erosion, and sensitivity to man's activities. (See also W74-06619) (Knapp-USGS)
W74-06627

GEOGRAPHIC APPLICATIONS OF ERTS-1 DATA TO LANDSCAPE CHANGE,
Tennessee Univ., Knoxville. Dept. of Geography.
J. B. Rehder.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 955-963, 1973. 8 fig.

Descriptors: *Remote sensing, Satellites(Artificial), *Mapping, *Urbanization, *Strip mines, Land use, Surveys, Data collections, Data processing, *Tennessee.
Identifiers: *ERTS.

Analysis of landscape change requires large are coverage on a periodic basis in order to analyze aggregate changes over an extended period of time. The ERTS program can provide this capability. Three avenues of experimentation and analysis are being used in the investigation: (1) a multiscale sampling procedure utilizing aircraft imagery for ground truth and control, (2) a densitometric and computer analytical experiment for the analysis of gray tone signatures, comparisons, and ultimately for landscape change detection and monitoring, and (3) an ERTS image enhancement procedure for the detection and analysis of photomorphic regions. The data are being analyzed on the East Tennessee Test Site, a 20,000-square-mile region with landscape change elements such as forest alterations, strip mines, highway construction, urban-suburban growth, and cyclic seasonal changes in agriculture. The Knoxville Test Site, an 11-x 21-mile area which encompasses the city of Knoxville, is being investigated for landscape change associated with urban growth. A second smaller test site on the Cumberland plateau is being monitored for forest alterations and landform disturbances associated with surface strip mining for coal. LAND USE OF NORTHERN MEGALOPOLIS,
Dartmouth Coll., Hanover, N. H.
R. B. Simpson, and D. T. Lindgren.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrolton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 973-980, 1973. 4 fig.

Descriptors: *Remote sensing, Satellites(Artificial), *Land use, *Mapping, Surveys, Data collections, Data processing, Urbanization, Farms, Forests, Rural areas, New England, *Cities, Connecticut, Massachusetts, Rhode Island.
Identifiers: *ERTS.

ERTS data were used to map and digitize the land use of northern Megalopolis (Massachusetts, Connecticut, and Rhode Island) and to evaluate ERTS as a planning tool for megalopolitan areas. The southern New England region provides a good test of ERTS's capabilities because of its complex landscape. Not only are there great differences in the degree of urban development, but in relief and vegetative cover as well. Land use classification was applied with relatively good accuracy. Several categories, particularly the nonbuiltup ones, were identified with great accuracy, while the buildup categories have several areas of difficulty. (See also W74-06619) (Knapp-USGS)
W74-06630

REMOTE SENSING APPLIED TO LAND-USE STUDIES IN WYOMING,
Wyoming Univ., Laramie. Dept. of Geology.
R. M. Breckenridge, R. W. Marrs, and D. J. Murphy.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 981-989, 1973. 3 fig.

Descriptors: *Remote sensing, Satellites(Artificial), *Land use, *Wyoming, Strip mines, Urbanization, Farms, Grasslands, Reservoirs, Lakes, Geologic mapping, Data collections, Data processing, Terrain analysis, *Mapping.
Identifiers: *ERTS.

Preliminary evaluations of ERTS-1 show that physiographic and land-use inventory maps can be compiled by using a combination of visual and automated interpretation techniques. Test studies in the Powder River basin of Wyoming show that ERTS image interpretations can provide much physiographic and land-use information needed for management of fuel resources. Water impoundments as small as one acre were detected, and water bodies larger than five acres could be mapped and their acreage estimated. Flood plains, irrigated lands, and some individual crops were identified and mapped. Coniferous and deciduous trees were mapped separately. Gross soil distinctions were made and were found to be closely related to the bedrock geology. Several broad unstable areas were identified. These were related to specific geologic and slope conditions and generally extended through large regions. Some new oil fields and all large open-cut coal mines were mapped. The most difficult task accomplished was that of mapping urban areas. Most Wyoming towns are surrounded by agricultural land, natural flood plains, and rangeland. Areas of new development can usually be defined. Snow cover provides a considerable degree of enhancement of the urban areas by increasing the constrast between the populated areas and the surrounding country. (See also W74-06619) (Knapp-USGS)
W74-06631

ERTS-1 APPLICATIONS TO MINNESOTA LAND USE MAPPING,
Minnesota Univ., Minneapolis. Dept. of Geography.
D. Brown, J. Gamble, S. Prestin, D. Trippler, and M. Meyer.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 991-997, 1973. 8 fig.

Descriptors: *Remote sensing, Satellites(Artificial), *Land use, *Minnesota, Urbanization, Farms, Mining, Forests, Wetlands, Data collections, Data processing, *Mapping.
Identifiers: *ERTS.

Land use class definitions that can be operationally employed with ERTS-1 imagery are being developed for Minnesota. Investigations of urban, extractive, forest, and wetlands areas indicate that it is feasible to subdivide each of these classes into several subclasses with the use of ERTS-1 images from one or more time periods. (See also W74-06619) (Knapp-USGS)

W74-06632

A MULTIDISCIPLINARY SURVEY FOR THE MANAGEMENT OF ALASKAN RESOURCES UTILIZING ERTS IMAGERY,
Alaska Univ., College.
J. M. Miller, and A. E. Belon.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 999-1005, 1973. 5 fig.

Descriptors: *Remote sensing, Satellites(Artificial), *Alaska, *Mapping, *Land management, Land use, Forests, Transportation, Mining, Surveys, Data collections, Fisheries, Ecology, Tundra.
Identifiers: *ERTS.

ERTS-1 data were applied to a coordinated multidisciplinary survey of Alaska to provide updated resource inventory data to land use planning groups and government agencies concerned with resource management. Of particular emphasis in this survey are vegetative, hydrological, and geological analyses of the proposed trans-Alaska transportation corridor, and lands to be selected by the State of Alaska, the native corporations, and the Department of Interior. ERTS data are satisfying these objectives on a regional scale. (See also W74-06619) (Knapp-USGS)
W74-06633

THE USE OF ERTS-1 DATA FOR THE INVENTORY OF CRITICAL LAND RESOURCES FOR REGIONAL LAND USE PLANNING,
Wisconsin Univ., Madison.
J. L. Clapp, R. W. Kiefer, M. M. McCarthy, and B. J. Niemann, Jr.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1007-1014, 1973. 6 fig.

Descriptors: *Remote sensing, Satellites(Artificial), *Mapping, *Wetlands, *Wisconsin, Surveys, *Land use, Planning, Data collections, Data processsing, Regional analysis.
Identifiers: *ERTS.

In eastern Wisconsin, computer-generated spatial and statistical comparisons of critical land resource data derived from conventional sources, RB-57 photographs, and ERTS images suggest that land resource data can be mapped from ERTS images on a statewide basis. ERTS-interpreted information of wetland resources was more descriptive and accurate than the current statewide information sources. For the detection of the wetland resources as overall patterns, the ERTS images appear comparable to RB-57 photographs as a data source. (See also W74-06619) (Knapp-USGS)
W74-06634

INVESTIGATIONS OF AN URBAN AREA AND ITS LOCALE USING ERTS-1 DATA SUPPORTED BY U-PHOTOGRAPHY,
Pennsylvania State Univ., University Park. Office for Remote Sensing of Earth Resources.
H. A. Weeden, F. Y. Borden, D. N. Applegate, and N. Bolling.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellites-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1015-1022, 1973. 4 fig, 1 tab, 2 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Urbanization, Aerial photography, Mapping, Surveys, Data collections, Data processing, Photogrammetry, Farms, Forests, *Pennsylvania, *Cities.
Identifiers: *ERTS.

An urban area in central Pennsylvania and the surrounding locality were investigated by photointerpretation of ERTS-1 imagery and by computer processing of MSS tapes. The photointerpretation and processing were then coordinated. The results of the cooperative effort of photointerpreters and computer processing analysts were much improved over independent efforts. Single frames of U-2 photography could be projected onto printer output maps with little recognizable distortion in areas 10 to 25 cm square. In this way targets could be identified for use as training areas for computer-processed signature identification. In addition, at any stage of category mapping, the level of success in correct classification could be assessed by this method. (See also W74-06619) (Knapp-USGS)
W74-06635

FIRST LOOK ANALYSES OF FIVE CYCLES OF ERTS-1 IMAGERY OVER COUNTY OF LOS ANGELES: ASSESSMENT OF DATA UTILITY FOR URBAN DEVELOPMENT AND REGIONAL PLANNING,
General Electric Co., Philadelphia, Pa. Missile and Space Div.
S. Raje, R. Economy, and J. McKnight.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1023-1030, 1973. 5 fig.

Descriptors: *Remote sensing, Satellites(Artificial), *Cities, *Land use, *Urban mapping, *California, Planning, Data collections, Data processing, Urbanization, Surveys, Regional analysis.
Identifiers: *ERTS, *Los Angeles.

Significant results were obtained from the analyses of ERTS-1 imagery from five cycles over Los Angeles by photointerpretation and by an interactive hybrid multispectral information extraction system. Photointerpretation of ERTS images produced over 25 overlays at 1:1,000,000 scale depicting regional relations and urban structure in terms of several hundred linear and areal features. A possible new fault lineament has been discovered on the northern slope of the Santa Monica mountains. An ERTS scene analyzed to provide object class patterns was directly overlaid on a current Los Angeles County land use pattern map prepared at 1:24,000 scale. The geometric and thematic content is sufficient for routine use at the 1:24,000 standard operating scale for county and regional planning. (See also W74-06619) (Knapp-USGS)
W74-06636

PREPARATION OF URBAN LAND USE INVENTORIES BY MACHINE-PROCESSING OF ERTS MSS DATA,
Purdue Univ., Lafayette, Ind. Lab. for Applications of Remote Sensing.
W. Todd, P. Mausel, and K. Wenner.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1031-1039, 1973. 3 fig, 1 tab.

Descriptors: *Remote sensing, Satellites(Artificial), *Urban mapping, *Land use, *Cities, Data collections, Data processing, Suburban areas, Roads, Forests, Surveys, Mapping.
Identifiers: *ERTS, Milwaukee, Chicago, Indianapolis.

Spectral classes of urban phenomena identified from Earth Resources Technology Satellite (ERTS) multispectral scanner data in Milwaukee included suburban, inner city, industry, grass (open area), road, wooded suburb, water, cloud and shadow. The Milwaukee spectral class statistics were used to classify the Chicago area within the same ERTS frame, and similar results were achieved. In another ERTS frame Marion County (Indianapolis) data were classified into similar classes. The Marion County ERTS study was supported by a land use classification of an area near downtown Indianapolis that utilized 12 band MSS data collected by aircraft from 3,000 feet. The results of the ERTS analyses suggest that satellite data will be useful tool for the urban planner for monitoring urban land use. (See also W74-06619) (Knapp-USGS)
W74-06637

A COMPARISON OF LAND-USE DETERMINATIONS USING DATA FROM ERTS-1 AND HIGH ALTITUDE AIRCRAFT,
National Aeronautics and Space Administration, Houston, Tex. Lyndon B. Johnson Space Center.
M. A. Lundelius, C. M. Chesnutwood, J. G. Garcia, and R. B. Erb.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1041-1046, 1973. 3 fig, 1 append.

Descriptors: *Remote sensing, Satellites(Artificial), *Urban mapping, *Land use, *Cities, Data collections, Data processing, Suburban areas, Roads, Forests, Surveys, Mapping, *Texas.
Identifiers: *ERTS, *Houston(Tex).

ERTS-1 MSS imagery was used in a study area in the Houston Area Test Site to classify land use. The two types of imagery used included: (1) black and white transparencies of each band enlarged to a scale of approximately 1:250,000 and (2) color transparencies composited from the computer compatible tapes using the film recorder on a multispectral data analysis station. Urban data from the same scene were also analyzed using a computer-aided (clustering) technique. The resulting clusters, representing areas of similar content were compared with land use patterns in Houston. A technique was developed to correlate the spectral clusters to specific urban features on aircraft imagery by the location of specific, high contrast objects in particular resolution elements. The surface feature composition within each picture element could then be determined from the aircraft imagery. It was concluded that ERTS-1 data could be used to develop Level I and many Level II land use categories for regional inventories and perhaps to some degree on a local level. (See also W74-06619) (Knapp-USGS)
W74-06638

DIGITAL LAND USE MAPPING IN OAKLAND COUNTY, MICHIGAN,
Environmental Research Inst. of Michigan, Ann Arbor.
I. J. Sattinger, and R. D. Dillman.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1047-1054, 1973. 4 fig.

Descriptors: *Remote sensing, Satellites(Artificial), *Land use, *Urban mapping, *Michigan, Recreation, Data collections, Data processing, Rural areas, Wetlands, Streams, Vegetation.
Identifiers: *Detroit, *ERTS.

ERTS-1 data for a portion of Oakland County, Michigan, was computer processed to produce a map of water, urban areas, wooded areas, and other vegetation. Comparison with RB-57 photography of the area shows a good correspondence of the two sources of data. Preliminary evaluation indicates that this type of four-category map derived from ERTS data will be useful for conceptual studies of large geographic areas in recreational planning. (See also W74-06619) (Knapp-USGS)
W74-06639

MAPPING OF AGRICULTURAL LAND USE FROM ERTS-1 DIGITAL DATA,
Pennsylvania State Univ., University Park. Office for Remote Sensing of Earth Resources.
A. D. Wilson, G. A. May, and G. W. Peterson.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1055-1058, 1973. 2 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Land use, *Farms, Pennsylvania, Mapping, Surveys, Cities, Urbanization, Forests, Data collections, Data processing.
Identifiers: *ERTS.

A selected area in Lancaster and Lebanon Counties, two of the major agricultural counties in Pennsylvania, was studied using ERTS data. This area was delineated on positive transparencies on MSS data collected on October 11, 1972. Channel seven was used to delineate general land forms, drainage patterns, water and urban areas. Channel five was used to delineate highway networks. These identifiable features were useful aids for locating areas on the computer output. The use of ERTS digital data for the automatic mapping of land use appears very feasible. Forest land, cultivated land and water were classified within a 5,000-acre area. Computer-generated maps were used to delineate broad land use categories, such as forest land, agricultural land, urban areas and water. These digital maps have a scale of approximately 1:24,000, allowing direct comparison with U.S.G.S. 7.5 minute quadrangle sheets. Aircraft data were used as a form of ground truth useful for the delineation of land use patterns. (See also W74-06619) (Knapp-USGS)
W74-06640

THE USE OF THE TEMPORAL DIMENSION IN CLASSIFYING AND MAPPING ERTS-1 MSS DATA,
Pennsylvania State Univ., University Park. Office for Remote Sensing of Earth Resources.
F. Y. Borden, and D. N. Applegate.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1059-1066, 1973. 2 fig, 1 tab, 1 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Land use, Cities, Urbanization, Transportation, Streams, Vegetation, Data collections, Data processing, *Pennsylvania, Land classification.
Identifiers: *ERTS.

ERTS-1 MSS data from two scenes of the same central Pennsylvania area were brought into registration by translation and then merged. The two scenes were viewed on different dates but from adjacent ground tracks. Targets selected to be mapped included river water, railroad yards, creeks, urban areas, industrial areas, and vegetation. Equivalent training areas were chosen from each of the original scenes and from the merged data. Classification maps were produced for each, and a comparison was made. Scene brightness was found to have the most important effect on classification differences. (See also W74-06619) (Knapp-USGS)
W74-06641

IDENTIFICATION AND MAPPING OF COAL REFUSE BANKS AND OTHER TARGETS IN THE ANTHRACITE REGION,
Pennsylvania State Univ., University Park. Office for Remote Sensing of Earth Resources.
F. Y. Borden, D. N. Thompson, and H. M. Lachowski.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1067-1074, 1973. 2 fig, 1 tab, 2 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Coal mines, *Mine wastes, *Pennsylvania, Mapping, Surveys, Strip mines, Planning, Data collections, Data processing, Pollutant identification.
Identifiers: *ERTS.

ERTS-1 MSS data covering parts of Pennsylvania's southern and eastern middle anthracite coal fields were studied to determine how well accumulations of coal refuse could be identified and mapped by computer analysis and processing. Spectral signatures of coal refuse targets were similar to water but had higher reflectances in all channels. Although no underflight photography was at hand to judge mapping success, correlation was made with 1:24,000 scale U.S. Geological Survey maps dated 1974 and 1948. Coal refuse targets correlated well with existing maps. (See also W74-06619) (Knapp-USGS)
W74-06642

AUTOMATIC INTERPRETATION OF ERTS DATA FOR FOREST MANAGEMENT,
Honeywell, Inc., St. Paul, Minn. Systems and Research Center.
L. Kirvida, and G. R. Johnson.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1075-1082, 1973. 6 fig, 1 tab.

Descriptors: *Remote sensing, Satellites(Artificial), *Surveys, Forests, *Mapping, Forestry, *Forest management, Data collections, *Data processing, Automation.
Identifiers: *ERTS.

Automatic stratification of forested land from ERTS-A data provides a valuable tool for resource management. The results are useful for wood product yield estimates, recreation and wild life management, forest inventory and forest condition monitoring. Automatic procedures based on both multispectral and spatial features are evaluated. With five classes, training and testing on the same samples, classification accuracy of 74% was achieved using the MSS multispectral features. When adding texture computed from 8 x 8 arrays, classification accuracy of 99% was obtained. (See also W74-06619) (Knapp-USGS)
W74-06643

LAND RESOURCES SURVEY FOR THE STATE OF MICHIGAN,
Environmental Research Inst. of Michigan, Ann Arbor.
B. Sellman.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1083-1090, 1973. 4 fig.

Descriptors: *Remote sensing, Satellites(Artificial), *Mapping, *Land resources, *Michigan, *Land use, Surveys, Data collections, Data processing, Forests, Wetlands, Farms, Cities, Urbanization.
Identifiers: *ERTS.

ERTS-1 satellite imagery was evaluated as an information source for a statewide inventory of Michigan's land resources. The study uses photointerpretation of MSS photography and computed processed results. The first task completed was a 1:500,000-scale land use map of the state in four classes: urban, forest, water, and agriculture and other. This map was constructed from existing information sources including federal, state and county maps, and aerial photography. An ERTS color IR photomosaic for the entire state will also be constructed at a scale of 1:250,000. (See also W74-06619) (Knapp-USGS)
W74-06644

TERRAIN CLASSIFICATION MAPS OF YELLOWSTONE NATIONAL PARK,
Environmental Research Inst. of Michigan, Ann Arbor.
F. J. Thomson, and N. E. G. Roller.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1091-1095, 1973. 2 fig, 1 tab.

Descriptors: *Remote sensing, Satellites(Artificial), *Terrain analysis, *Mapping, *National parks, Surveys, Topography, Forests, Grasslands, Vegetation, Data collections, *Land classification.
Identifiers: *ERTS, *Yellowstone National Park.

Preliminary terrain classification maps of Yellowstone National Park were prepared by applying multispectral pattern recognition techniques to ERTS-MSS digital data. The five categories recognized were exposed rock and soil, water, coniferous forest, grass-sage vegetation, and lowland grassy vegetation. (See also W74-06619) (Knapp-USGS)

NATURAL RESOURCE INVENTORY AND MONITORING IN OREGON WITH ERTS IMAGERY,
Oregon State Univ., Corvallis.
G. H. Simonson, D. P. Paine, C. E. Poulton, R. D. Lawrence, and J. H. Herzog.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1451-1458, 1973. 6 fig, append.

Descriptors: *Remote sensing, Satellites(Artificial), *Natural resources, *Oregon, *Surveys, Data collections, Data processing, Land use, Forests, Grazing, Vegetation, Forestry, Clear-cutting, Monitoring, Farms, Irrigation.
Identifiers: *ERTS, Cook County(Oregon).

Multidiscipline team interpretation of ERTS and flight imagery provides resource and land use information needed for land use planning in Oregon. A coordinated inventory of geology, soil-land-

scapes, forest and range vegetation, and land use for Crook County illustrates the value of this approach for broad area and state planning. Other applications include mapping fault zones, inventory of forest clearcut areas, location of forest insect damage, and monitoring irrigation development. Computer classification is being developed for use in conjunction with visual interpretation. (See also W74-06619) (Knapp-USGS)
W74-06683

RESOURCE MANAGEMENT IMPLICATIONS OF ERTS-1 DATA TO OHIO,
Ohio Dept. of Economic and Community Development, Columbus.
D. C. Sweet, T. L. Wells, and G. E. Wukelic.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1459-1466, 1973. 5 fig, 1 tab.

Descriptors: *Remote sensing, Satellites(Artificial), *Land use, *Surveys, *Ohio, Strip mines, Air pollution, Monitoring, Data collections, Management, Planning.
Identifiers: *ERTS, *Resource management.

Experimental analysis of ERTS-1 imagery demonstrates that remote sensing from space is a means of delineating and inventorying Ohio's strip-mined areas, detecting powerplant smoke plumes, and providing the data necessary for periodically compiling land use maps for the entire state. The nature and extent of these problems throughout Ohio are summarized. How ERTS data can contribute to their solution and the long-term significance of these initial findings to overall resource management interests in Ohio are discussed. (See also W74-06619) (Knapp-USGS)
W74-06684

ASSESSMENT OF SOUTHERN CALIFORNIA ENVIRONMENT FROM ERTS-1,
California Univ., Riverside. Dept. of Geography.
L. W. Bowden, and J. H. Viellenave.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1467-1474, 1973. 3 fig.

Descriptors: *Remote sensing, Satellites(Artificial), *Environment, *California, Data collections, Monitoring, Surveys, Natural resources, Recreation, Vegetation, Urbanization, Land use.
Identifiers: *ERTS.

ERTS-1 imagery is a useful source of data for evaluation of earth resources in Southern California. Applications of ERTS data include detection and identification of macroscale tectonic and vegetational patterns, as well as detailed analysis of urban and agricultural processes. The sequential nature of ERTS-1 imagery allows monitoring significant changes in the environment. Some preliminary work has begun, directed toward assessing the impacts of expanding recreation, agriculture, and urbanization on the fragile desert environment. (See also W74-06619) (Knapp-USGS)
W74-06685

APPLICATIONS OF REMOTE SENSING (ERTS) TO RESOURCE MANAGEMENT AND DEVELOPMENT IN SAHELIEN AFRICA (REPUBLIC OF MALI),
American Univ., Washington, D.C. Dept. of Biology.
N. H. MacLeod.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1475-1481, 1973. 3 fig.

Descriptors: *Remote sensing, Satellites(Artificial), *Land use, *Geologic mapping, Grazing, Farms, Floods, Deserts, Data collections, Dunes, *Arid lands.
Identifiers: *ERTS, *Mali(Sahara region).

The primary resource management problem in Sub-Saharan Africa (the Sahel) is increasing aridity. ERTS observations were made of sand streams, dune orientations, moisture and vegetation changes and other factors. A second major interest is grazing of cattle, sheep, and goats, which is associated with major movements of people and animals twice yearly to obtain forage. The changes in available forage are being observed. The location of the cultivators is also being mapped from ERTS imagery. Hydrological analysis is being carried on in the Niger and Bani River watersheds. The size, timing, and areal extent of the annual flood is of particular interest. So far, good imagery of the maximum flood stage has been obtained and assessed. Geologic information on fault zones, sand dune formations, scarps, tectonic basins and focal points of faulting are all visible. (See also W74-06619) (Knapp-USGS)
W74-06686

FIRST ERTS-1 RESULTS IN SOUTHEASTERN FRANCE: GEOLOGY, SEDIMENTOLOGY, POLLUTION AT SEA,
Institut Francais du Petrole, des Carburants et Lubrifiants, Rueil-Malmaison (France).
A. Fontanel, J. Guillemot, and M. Guy.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1483-1491, 1973. 4 fig.

Descriptors: *Remote sensing, Satellites(Artificial), *Geological mapping, Paleohydrology, Sedimentation, Water pollution, Surveys, Mapping, Data collections, Deltas, Structural geology, *Pollutant identification.
Identifiers: *ERTS, *Alps, *France(Rhone Delta).

ERTS photos of Western Alps are very useful for tectonic interpretation because large features are clearly visible on these photographs even though they are often hidden by small complicated structures if studied on large-scale documents. The variations of the shorelines in the Rhone Delta for a period covering the last 8,000 years could be seen. Some instances of industries discharging pollutant products at sea were detected, as well as very large anomalies of unknown origin. Coherent optical processing brings out tectonic features in the Alps. (See also W74-06619) (Knapp-USGS)

INITIAL EVALUATION OF THE GEOLOGIC APPLICATIONS OF ERTS-1 IMAGERY FOR NEW MEXICO,
New Mexico Bureau of Mines and Mineral Resources, Socorro.
Linden K. Vonder, and F. E. Kottlowski
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1561-1566, 1973. 1 fig.

Descriptors: *Remote sensing, Satellites(Artificial), *Geologic mapping, *New Mexico, Data collections, Surveys, Mapping, Structural geology, Vegetation, Geomorphology.
Identifiers: *ERTS, Pecos River Valley(N Mex).

Images recorded during the first two months of the ERTS-1 mission in New Mexico are of poor quality, owing largely to high ground reflectance. Later images are of better quality, and MSS bands 5 and 7 have proven to be particularly useful. Features noted include major structural forms, vegetation patterns, drainage patterns, and outcrops of geologic formations. The Border Hills Structural Zone and the Y-O Structural Zone are prominently reflected in coverage of the Pecos Valley. A study of available maps and remote sensing materials covering the Deming-Columbus area indicated that the limit of detection and the resolution of MSS products are not as good as those of aerial photographs, geologic maps, and manned-satellite photographs. The limit of detection of high-contrast features on MSS prints is approximately 1,000 feet or 300 meters for linear features and about 18 acres for roughly circular areas. USE OF ERTS-1 DATA FOR REGIONAL PLANNING IN THE METROPOLITAN WASHINGTON COUNCIL OF GOVERNMENTS--A SHORT BRIEF,
Metropolitan Washington Council of Governments, D.C. Remote Sensing Project.
H. J. Mallon.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1613-1624, 1973. 6 fig, 4 ref

Descriptors: *Remote sensing, Satellites(Artificial), *City planning, *Urbanization, Cities, *District of Columbia, *Land use, Surveys, Mapping, Data collections, Regional analysis.
Identifiers: *ERTS.

Land use and land use activity changes represent basic data requirements in regional planning studies. ERTS remote sensing imagery can provide necessary data. One study using large-scale aircraft imagery developed a high degree of analytical detail and functional identification. ERTS and small-scale aircraft imagery developed data identifying in more general detail major activity changes within the metropolitan region. (See also W74-06619) (Knapp-USGS)

W74-06700

LAND USE MAPPING AND CHANGE DETECTION USING ERTS IMAGERY IN MONTGOMERY COUNTY, ALABAMA,
Alabama Univ., University. Dept. of Civil and Mineral Engineering.
R. P. Wilms.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1625-1633, 1973. 3 fig, 2 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Land use, *Urbanization, *Alabama, City planning, Surveys, Mapping, Data collections, Farms, Forests, Suburban areas.
Identifiers: *ERTS, *Montgomery County(Ala).

The feasibility of using remotely sensed data from ERTS-1 for mapping land use and detecting land use change in Montgomery County, Alabama, was investigated. Land use information was gathered from 1964 air photo mosaics and from 1972 ERTS data. The 1964 data provided the basis for comparison with ERTS-1 imagery. From this comparison, urban sprawl was quite evident for the city of Montgomery. A significant trend from forestland to agricultural was also discovered. The development of main traffic arteries between 1964 and 1972 was a vital factor in the development of some of the urban centers. Remotely sensed data from ERTS is useful for inventorying land use and detecting land use change. (See also W74-06619) (Knapp-USGS)
W74-06701

DETERMINATION OF LAND USE IN MINNESOTA BY AUTOMATIC INTERPRETATION OF ERTS MSS DATA,
Honeywell, Inc., St. Paul, Minn. Systems and Research Center.
R. E. Zirkle, and D. R. Pile.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1635-1639, 1973. 1 tab.

Descriptors: *Remote sensing, Satellites(Artificial), *Land use, *Lakes, *Minnesota, Surveys, Data processing, Data collections, Mapping.
Identifiers: *ERTS.

The feasibility of identifying land use in Minnesota by automatic interpretation of ERTS-MSS data was tested. Ultimate objectives include establishment of land use delineation and quantification by computer processing with a minimum of human operator interaction. A lake count in Ramsey County was compared to the ERTS-derived count and a concurrent aerial photo planimetry count. The results were usually within 10% on individual water bodies. (See also W74-06619) (Knapp-USGS)
W74-06702

PRECISION ANNOTATION OF PREDETERMINED PRIMARY SAMPLING UNITS ON ERTS-1 MSS IMAGES,
Earth Satellite Corp., Berkeley, Calif.
J. W. van Roessel, and P. G. Langley.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1661-1673, 1973. 2 fig, 1 tab, 2 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Data processing, *Mapping, Forests, Forestry, Boundaries(Property), Management, Surveys, Data collections, Terrain analysis, *Forest management.
Identifiers: *ERTS.

Resectioning programs were developed for projecting the boundary corners of sample units, management units, and counties into ERTS-1 and other MSS images. The technique used includes corrections for earth curvature, terrain elevation, and MSS distortions. The minimum standard error obtained was about 0.15 mm or 150 meters on the ground. This technique makes it possible to include land ownership as an integral part of forest resource sampling plans using ERTS imagery. (See also W74-06619) (Knapp-USGS)

APPLICATION OF ERTS-1 IMAGERY IN THE FIELDS OF GEOLOGY, AGRICULTURE, FORESTRY, AND HYDROLOGY TO SELECTED TEST SITES IN IRAN,
Imperial Government of Iran, Tehran. Plan Organization.
K. Ebtehadj.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1699-1714, 1973. 6 plate, 3 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Surveys, *Mapping, Geologic mapping, Forests, Farms, Lakes, Data collections, Data processing.
Identifiers: *ERTS, *Iran.

In a preliminary study of the ERTS-1 imagery coverage of Iran, all of the images were carefully examined, and a photomosaic covering approximately 95% of the country was prepared. A number of images of selected areas were studied in detail. A number of large-scale faults were identified which do not figure on geological maps. A preliminary study was carried out on the recent sediments, their possible sources, and origin. A limited number of geological work maps were prepared. In the fields of agriculture and forestry, studies based on color composite prints of certain areas were undertaken to identify arable areas. Investigations in the field of water resources resulted in the discovery of a number of small lakes and streams. Furthermore, fluctuations of the water level in some lakes were observed. CHOCTAWHATCHEE RIVER AND HOLMES CREEK, FLORIDA, PERMIT APPLICATION BY FLORIDA GAME AND FRESH WATER FISH COMMISSION (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District, Mobile, Ala.

Available from the National Technical Information Service as EIS-FL-73-0455-F, $5.00 in paper copy, $1.45 in microfiche. June 16, 1972. 56 p, 1 map.

Descriptors: *Florida, *Navigable rivers, *Aquatic habitats, *Environmental effects, Channel improvement, Beds, Water sports, Turbidity, Biota, Ecology.
Identifiers: Navigation obstructions, *Environmental Impact Statement, *Holmes Creek(Fla), *Choctawhatchee River(Fla).

This environmental impact statement involves the application for a permit to remove from the Choctawhatchee River and Holmes Creek snags and stumps that are navigational hazards to small boats. The project would take place on the Choctawhatchee River from the Alabama-Florida State line to the mouth and on Holmes Creek from Vernon to its confluence with the Choctawhatchee. Environmental impacts include increase in opportunity for safe usage of the resource for boating, fishing, and general recreation. Adverse environmental effects include reduction of aquatic habitat, temporary increase in turbidity, and insignificant effect upon biota. (Sears-Florida)

Soil Conservation Service, Berkeley, Calif.
Available from the National Technical Information Service as EIS-CA-73-0465-F. $4.25 microfiche $1.45. January 1973. 38 p, 2 map, 1 tab, 3 append.

Descriptors: *Drainage, *Environmental effects, Watersheds, Saline soils, Salts, Waste flows, Crops, *California, Wildlife, Fish.
Identifiers: *Environmental Impact Statements, *Patterson watershed project(Calif), Stanislaus County(Calif).

The watershed protection and agricultural drainage project located in Stanislaus County, California will lower the high water table on 4,190 acres; improve the physical condition of the soil; remove excess soluble salts from the soil; eliminate health hazards due to wet basements and poor septic tank operation; contribute additional dissolved salts to the San Joaquin River and existing drainage ditches; eliminate mosquito-breeding areas; increase crop yields; and create temporary disturbances during construction. The project should not have a significant effect on fish. No project impact on wildlife is anticipated. Small environmental values will be temporarily disturbed while the project is being installed. Some adverse environmental effects include temporary removal of a small land area from production and a possible small increase in waste flows from local food processing plants. (Daniels-Florida)

LOWER KLAMATH RIVER FLOOD CONTROL PROJECT, DEL NORTE COUNTY, CALIFORNIA (FINAL ENVIRONMENTAL IMPACT STATMENT).
Army Engineer District, San Francisco, Calif.
Available from the National Technical Information Service as EIS-CH-73-0494-F. PC $4.50 microfiche $1.45. July 1972. 42 p, 5 plate.

Descriptors: *California, *Flood protection, *Levees, Landfills, Bank protection, Flood plain zoning, Aquatic habitats, Federal budget.
Identifiers: *Environmental Impact Statements, Del Norte County(Calif), *Klamath River(Calif).

This project was authorized under the Flood Control Acts of 1966 and 1970 for the purpose of providing for the flood protection work necessary to preserve the towns and river banks for commercial and recreational opportunities. Flood control for the Lower Klamath River is a three part project which includes filling a depressed area behind a highway, a levee system surrounding a town, and bank protection on the north bank along a two mile reach beginning near the mouth of the river. The flood plain is managed by the county. Environmental impacts include loss of riparian habitat in levee sites and bank protection areas, and preservation of important recreational area through flood plain zoning. Adverse environmental effects include some loss of native vegetation in borrow area and levee sites, temporary loss of riparian habitat in bank protection areas, and temporary turbidity during construction. (Sears-Florida)

NUTWOOD WATERSHED, ILLINOIS (FINAL ENVIRONMENTAL STATEMENT).
Soil Conservation Service, Washington, D. C.
Available from the National Technical Information Service as EIS-IL-73-0606-F. PC $5.00 microfiche $1.45. March 1973. 52 p, 4 append.

Descriptors: *Illinois, *Watersheds(Basins), *Watershed management, *Land management, Floodwater, Water level, Flood control, Hydrologic aspects, Erosion, Sediment, Drainage, Fishery, Aquatic habitat, Environmental effects, Turbidity.
Identifiers: *Environmental Impact Statements, Jerseyville(Ill), *Nutwood watershed(Ill).

This watershed project is to be carried out in Jersey and Greene Counties, Illinois by three sponsoring local organizations with federal assistance. The project will include land treatment measures supplemented by three floodwater retarding structures, two water level control structures, and one pumping station. Project purposes include improvement of hydrologic conditions, reduction of erosion, sediment, and floodwater damage and improvement of agricultural drainage. The land treatment program will reduce annual upland erosion, promote more efficient land use, and reduce water runoff. Combined land treatment and structural measures will reduce sediment and floodwater damages. Bottomland will benefit from flood control, improved drainage, and more intensive land use. A lake fishery and aquatic habitat will replace pasture land, and woodland and pasture will be periodically inundated by flood detention pools. Construction of the dams and spillways will temporarily disturb or destroy some vegetative cover. (Sears-Florida)
W74-06990

PROPOSAL FOR OKLAWAHA RIVER, OCALA NATIONAL FOREST, FLORIDA, (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Forest Service (USDA), Washington, D.C.
Avail from Nat Tech Info Serv, U.S. Dept of Commerce, Springfield, Va as EIS-FL-73-0075-F-2. PC $23.00, microfiche $1.45. Vol 2, Appendices 15-44, January 1973. 419 p, 29 append, 6 map, 20 chart, 91 tab.

Descriptors: *Florida, *Environmental effects, *Reservoirs, *Legislation, *Canals, Biology, Navigation, Locks, Saline water intrusion, Canal seepage, Backwater, Water utilization, Surface water, Habitats, Soil-water-plant relationship, Aquatic environment
Identifiers: *Environmental Impact Statements, Marion County(Fla), *Oklawaha River(Fla)

This volume contains thirty appendices regarding various studies, reports and projects within the Oklawaha River Proposal. Included are the following: report of fisheries study team, Lake Oklawaha; aquatic vegetation in Lake Oklawaha, recreation use, Rodman Dam; Oklawaha survey; soil properties affected by flooding in Oklawaha River; reproduction survey in Oklawaha River; reports of various organizations on the Cross-Florida Barge Canal; various studies and reports involving aquatic vegetation; and dissolved oxygen levels in Lake Oklawaha. (Conko-Florida)

FLORIDA MANGROVES AS SHORELINE STABILIZERS,
Florida Dept. of Natural Resources, St. Petersburg. Marine Research Lab.
T. Savage.
Fla Dep Nat Resour Mar Res Lab Prof Pap Ser. 19 p 1-46. 1972. Illus.
Identifiers: Avicennia-Germinans, *Florida, *Mangroves(Red and Black), Protection, Rhizophora-Mangle, *Shoreline stabilizers(Plants).

A preliminary assessment of the use of native mangroves for shoreline stabilization and protection is reported. Field and laboratory tests were preformed to select the species and plant procedure best suited for this purpose. Based upon its broad latitudinal range, tolerance of adverse soil conditions, extensive early root system, and ease of transplanting, Avicennia germinans, the black mangrove, holds greatest promise for use in a state-wide program. Furthermore, it is at least as important as Rhizophora mangle, the red mangrove, in natural shoreline protection.--Copyright 1973, Biological Abstracts, Inc.

4B. Groundwater Management

NETWORK ANALYSIS OF CONJUNCTIVELY OPERATED GROUND WATER-SURFACE WATER SYSTEMS,
Illinois Univ., Urbana. Dept. of Civil Engineering.
A. S. Hamdan, and D. D. Meredith.
Available from the National Technical Information Service as PB-231 204; $7.00 in paper copy, $1.45 in microfiche. Illinois Water Resources Center, Urbana, Research Report No 76, January 1974. 75 p, 7 fig, 24 tab, 33 ref, append. OWRR A-059-ILL(2). 14-31-0001-3813.

Descriptors: *Optimum development plans, *Alternative water use, Surface-groundwater relationships, *Conjunctive use, Reservoir operation, *Water supply, Optimization, Operations research, *Illinois, Model studies, Networks, Flow, *Algorithms, Investment, Water policy, Constraints.
Identifiers: *Network flow analysis, Kaskaskia River basin(Ill).

The concept of network models is introduced and a general network model for a multiple purpose, multiple unit water resource system is developed. The 'out-of-kilter' algorithm is then presented as a solution technique for network flow problems. A model for preliminary screening of alternatives for water supply from conjunctive use of ground water and surface water in the Kaskaskia River Basin in Illinois is presented and analyzed. The results from the analysis demonstrate how the network procedures can be used to determine optimum investment plans, to test policy constraints, and to develop policies for future development and future constraints.

HYDROLOGIC DATA FROM THE PICEANCE BASIN, COLORADO.
Geological Survey, Denver, Colo.
Colorado Dept of Natural Resources, Denver, Colorado Water Resources Basic-Data Release No 31, J. F. Ficke, J. B. Weeks and F. A. Welder, Compilers, 1974. 246 p, 80 fig, 91 tab.

Descriptors: *Hydrologic data, *Colorado, *Water wells, *Groundwater basins, *Oil shales, Water levels, Water yield, Drillers logs, Water quality.
Identifiers: *Piceance basin(Colo).

Water data collected in and compiled for the Piceance basin, Colorado, are presented. Included are groundwater and surface-water data collected by the Geological Survey and private companies. Groundwater data were collected from 52 wells in the Piceance basin. Of the 52 wells, 25 wells have transmissivity data, 16 wells have discharge data, 39 wells have temperature data, 8 wells have vertical flow data, 37 wells have specific conductance data, 17 wells have common ion data, and 18 wells have trace element data. A potentiometric map of the report area is given. The map is based on the altitude of water levels in 51 observation wells which penetrate the Green River Formation. The water-level measurements were made during the summer of 1972. (Knapp-USGS)

GROUND-WATER RECHARGE STRIP BASIN-EXPERIMENTS,
California State Univ., Fullerton. Dept. of Civil Engineering.
R. R. Brock, and A. C. Amar.
Journal of the Hydraulics Division, American Society of Civil Engineers Vol 100, No HY4, Paper 10503, p 569-592, April 1974. 12 fig, 2 tab, 15 ref, append.

Descriptors: *Artificial recharge, *Groundwater recharge, *Hydraulic models, *Dupuit-Forchheimer theory, Porous media, Groundwater movement, Unsteady flow.

The problem of recharging a strip basin to a horizontal water table overlying an impervious base was formulated using the saturated flow equations. From this formulation the number of dimensionless variables that determine a dimensionless water table rise were identified using the exact or potential theory and an approximate (Dupuit-Forchheimer) theory. Experiments were performed in a 5-m long sand model. As a dimensionless recharge rate was increased, an expected systematic deviation from the theory is presumably a result of the invalidity of the assumption of the theory for deep flows. Experimental results are presented in the form of dimensionless graphs. (Knapp-USGS)

EFFECTS OF GROUND-WATER DEVELOPMENT ON THE PROPOSED PALMETTO BEND DAM AND RESERVOIR IN SOUTHEAST TEXAS,
Geological Survey, Austin, Tex.
E. T. Baker, Jr., and C. R. Follett.
Water-Resources Investigations 18-73, June 1973. 70 p, 20 fig, 6 tab, 14 ref.

Descriptors: *Baseline studies, *Groundwater resources, *Pre-impoundment, *Reservoirs, *Texas, Data collections, Hydrogeology, Hydrologic data, Aquifer characteristics, Water wells, Pumping, Water yield, Water level fluctuations, Land subsidence, Water table, Forecasting, Evaluation, Faults(Geologic), Damsites, Surface-groundwater relationships.
Identifiers: *Palmetto Bend Dam(Tex).

Palmetto Bend Dam and Reservoir, a water-supply project to be constructed in two stages, will impound the waters of the Navidad and Lavaca Rivers in Jackson County, Texas. This investigation was made in 1970-1972 to determine the effects of large-scale groundwater withdrawals on the proposed dam and reservoir. Groundwater continues to discharge into the Navidad and Lavaca Rivers by seepage outflow even though large amounts of groundwater are pumped for irrigation. Although a reduction in streamflow probably has occurred, a complete loss of the low flow of the streams by infiltration to a lowered water table seems remote. The large groundwater withdrawals will continue to cause land-surface subsidence, which will range from 0.012 foot to more than 0.026 foot per year. A minimum of about 0.013 to n studying seawater and those based on studying the sea bottom. The seawater methods incorporate investigations of the electric conductivity, the distribution of temperature, the anomalies of salt composition of seawater and groundwater discharge studies with tracers. The sea-bottom methods include locating groundwater discharge from data on physical or chemical anomalies in bottom sediments (geothermal and geochemical techniques) and investigating structural features of the sea bottom (geophysical method, geomorphological method and observations by divers and submersibles). Experience in studying submarine springs and groundwater discharge to the Baltic and Caspian Seas is discussed. (Knapp-USGS)

CONJUNCTIVE OPERATION OF SOUTHERN CALIFORNIA GROUND WATER BASINS WITH THE STATE WATER PROJECT,
Southern California Metropolitan Water District, Los Angeles.
V. Gleason, and D. Georgeson.
In: Proceedings of 9th Biennial Conference on Ground Water, Sept 13-14, 1973, Francisco Torres Conference Center, Goleta, Calif: California University Water Resources Center Report No 26, p 5-37, December 1973.

Descriptors: *Conjunctive use, *California, *Inter-basin transfers, Water resources development, Water management(Applied).
Identifiers: California Water Plan.

Conjunctive operation of Southern California groundwater basins with the State Water Project offers important benefits to Southern California specifically and to the State generally. Those include significant reduction of future State Water Project costs, improvement of the quality of Southern California's water supplies, more efficient use of electric power resources, and more effective use of groundwater basins. Under the storage-in-advance approach the project would use its available delivery capacity to transport surplus Sacramento Valley water to Southern California during wet years and store that water in vacant space within Southern California's groundwater basins for subsequent use during drought years. Under the replacement approach, the project would borrow water that is now in Southern California's groundwater basins when a drought curtails project imports to Southern California. The State or its water service contractors would guarantee the replacement of the borrowed water under terms that would assure full protection for the groundwater basins and their local users. MULTIDISCIPLINARY APPLICATION OF ERTS-1 DATA TO NORTH CAROLINA NATURAL RESOURCE MANAGEMENT,
North Carolina State Univ., Raleigh.
C. W. Welby, J. O. Lammi, and R. J. Carson.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1443-1450, 1973. 3 fig.

Descriptors: *Remote sensing, Satellites(Artificial), *Data collections, *Management, *Natural resources, Forestry, Urbanization, Sedimentation, *Clear-cutting, Turbidity, *North Carolina.
Identifiers: *ERTS, Natural resource management.

Two examples of the use of ERTS-1 data are monitoring of man's activities affecting the forest resource and pinpointing sources of sediment load in streams and rivers. In North Carolina most forest harvesting is done by the clear-cutting method. Imagery enlarged to a scale of approximately 1:300,000 provides a spectacular display of bare lands and affords a method for rapidly taking inventory of the total clear-cut acreage. Images of two rivers and chains of reservoirs along them provide an opportunity to evaluate ERTS-1 imagery as a tool to monitor sediment sources as well as loads of sediment. Critical areas requiring priority natural resource management action can be identified, and the updating of information about a region is valuable in effective planning and management of the natural resources. W74-06682

SENSITIVITY OF SURFACE RUNOFF TO VARIATIONS OF WATERSHED PARAMETERS IN SMALL URBAN AREAS-A KINEMATIC MODEL,
Howard Univ., Washington, D.C. Dept. of Civil Engineering.
C. L. Yen, and S. N. Sakhleh.
Available from the National Technical Information Service as PB-231 484 $4.00 in paper copy, $1.45 in microfiche. Completion Report, C.E. Report 74-02, January 1974, 77 p, 12 fig, 22 ref OWRR C-3261(3735)(1) 14-31-0001-3735.

Descriptors: *Urban runoff, *Roughness(Hydraulic), *Mathematical models, *Overland flow, Precipitation excess, *Infiltration rates, *Flood peak, *Slopes, Cities, Urbanization, Computer programs, Watersheds(Basins)
Identifiers: *Rainfall duration, Kinematic models

The continuing growth of urban areas that replace farm lands and forests with paved areas and structures inevitably brings about changes in watershed physical parameters such as surface slope, roughness and infiltration rates. The effects of these changes, which result in increased volume and peak rate of runoff that often cause tremendous damage to life and properties, needs to be better understood. The present study proposed a mathematical model, based on kinematic wave theory, to evaluate the effects of urbanization on peak flows for small areas. This model takes into account the spatial variations of slope, roughness, slope-length, rain-excess intensity and duration. Computer programs for watershed profiles having two and three sections with different parameters were written for computing peak overland flow under various conditions. The effects of varying infiltration rate, slope, roughness, slope-length and rainfall durations have been investigated using the model proposed. Results are: (i) high infiltration (pervious) portion located at the lower end of watershed profile reduces peak flow more effectively than at the upper end, (ii) increasing roughness-slope parameter beyond certain value will bring about little additional reduction in peak flow, and (iii) for a given rainfall duration, an optimum slope-length for managing peak flow can be found. These results need to be verified by laboratory or field observations.

AN EXPANDING ROLE FOR SUBARCTIC WATERSHED RESEARCH,
Cold Regions Research and Engineering Lab., Fairbanks, Alaska.
C. W. Slaughter, and A. E. Helmers.
Water Resources Bulletin, Vol 10, No 2, p 256-264, April 1974. 3 fig, 21 ref.

Descriptors: *Water resources, *Research and development, *Environment, *Arctic, Water balance, Hydrologic budget, Soils, Cold regions, Ecology, Climatology, Permafrost, Hydrology, Hydrogeology, Water yield, Data collections, Forestry, Land management.

Natural resources research should in many cases be broadened in scope and oriented toward more general environmental problems. Locales with a history of watershed research are suited for development of comprehensive, environmental research programs. In the North American Subarctic there is almost no history of watershed studies. Basic data on hydrometeorologic parameters such as precipitation amounts and areal and seasonal distribution of runoff are scarce; the data framework within which environmental understanding can be structured is exceedingly sketchy. Opportunity exists in the discontinuous-permafrost settings of central Alaska to begin rectifying this situation. A basic program of multiagency, multidiscipline research and data acquisition for the most significant hydrologic subregions is being research and data acquisition for the most significant hydrologic subregions is being developed, based around several existing environmental research areas, chiefly the Bonanaza Creek Experimental Forest, the Caribou-Poker Creeks Research Watershed, the Wickersham Dome Fire Study Area, and a series of outlying sites. (Knapp-USGS)

Identifiers: *Administrative regulations, *Environmental impact statement, *National Environmental Policy Act, *Standing(Legal), Public trust doctrine, Sierra Club.

The judicial system is finally helping to resolve a wide range of natural resource conservation controversies. The subjects of litigation are almost limitless, with the common denominator being the public's right to a quality environment. Ways are being found to knock down the old barriers to bringing such suits, such as the problem of standing to sue. In Scenic Hudson Preservation Conference v. Federal Power Commission, it was held that those who by their activities and conduct exhibited special interest in esthetic, conservational, and recreational aspects of power development were aggrieved parties. Standing has been found under the public trust doctrine in Gould v. Greylock Reservation Commission. In Sierra Club v. Hickel standing was denied on the grounds that no local conservation group was joined. However the Sierra Club is made up of local chapters and this case is being appealed. Many lawsuits concern the dredging and filling of tidal wetlands under the authority of the U.S. Army Corps of Engineers pursuant to the Rivers and Harbors Act of 1899. It has been held that permits may be withheld on environmental grounds in compliance with the National Environmental Policy Act. (Sperling-Florida)

Identifiers: *Environmental Impact Statements, Humphreys and Dickson Counties(Tenn), *Hurricane Creek Watershed(Tenn).

The project's purposes are watershed protection and prevention of floods and municipal water shortage. The project includes conservation land treatment measures to be supplemented by seven floodwater retarding structures and one multiple-purpose structure. The project will be funded by federal assistance under the authority of the Watershed Protection and Flood Prevention Act and will be implemented by the sponsoring local organizations. The proposed conservation land treatment measures should reduce erosion and sediment production by 29%. The structural measures should reduce floodwater crop and pasture damage on 4,820 acres of flood plain by 78%, sediment and flood plain scour damage by the same percentage and damages to roads and bridges by 93%. There should also be a reduction in in conveniences such as closed roads. About 755 acres of vegetation cover will be affected, including 163 acres of upland wildlife habitat that will be lost, and another 700 acres will be subject to certain land use changes. Alternatives considered included conservation land treatment alone, the purchasing of flood plain land for public use, combinations of 19 potential floodwater retarding structure sites with and without channel work, seeking alternate water sources, and maintaining the status quo. FRESHWATER BIOLOGY AND POLLUTION ECOLOGY: TRAINING MANUAL.
Environmental Protection Agency, Cincinnati, Ohio. Office of Water Program Operations.
Available from the National Technical Information Service as PB-224 201, $10.00 in paper copy, $1.45 in microfiche. Report No EPA-430/1-73-006, April 1973. 550 p, 220 fig, 37 tab, 754 ref.

Descriptors: *Training, *Aquatic environment, *Aquatic life, *Water pollution control, *Ecology, Waste water treatment, Systematics, Water quality, Education, Water pollution effects, Bioassay, Limiting factors, Analytical techniques, Aquatic animals, Aquatic plants, Legal aspects, Biodegradation, Indicators, Self-purification, Water temperature, Oil pollution.

This manual is designed as an introduction to aquatic biology for sanitary engineers, scientists, and others who are involved in freshwater pollution studies, surveillance, and control, and will have its greatest value as an adjunct to classroom presentations. Successful development and maintenance of an aquatic population or community depend upon a harmonious ecological balance between environmental conditions and tolerance of the organisms to variations in one or more of these conditions. The principle of limiting factors is one of the major aspects of the environmental control of aquatic organisms. Nomenclature is discussed in detail and aquatic plants and animals classified. The significance of fungi in the biodegradation of organic matter and bacteriological indicators of water pollution are described. The effects of organic pollution such as sewage or other readily oxidizable organic wastes are presented. This manual is primarily concerned with sublethal or chronic levels of pollutants. Recommendations are made for the protection of aquatic life resources and include courtroom procedure and case preparation. Effects of pollution on aquatic life include toxic and organic wastes which may be reinforced or neutralized by a complex of industrial wastes. (Jones-Wisconsin)

BIOMASS IN THE UPWELLING AREAS ALONG THE NORTHWEST COAST OF AFRICA AS VIEWED WITH ERTS-1,
Delaware Univ., Newark.
K-H. Szekielda, and R. J. Curran.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1385-1401, 1973. 10 fig.

Descriptors: *Remote sensing, Satellites(Artificial), *Productivity, Oceanography, *Plankton, Ocean currents, Primary productivity, Data collections, Atlantic Ocean, *Pollutant identification.
Identifiers: *ERTS, *Upwelling(Oceans), Africa.

ERTS imagery was studied as a means of acquiring data on marine productivity. Light penetration in water is affected by plankton, algae, and dissolved and suspended matter. As a consequence, the composition of backscattered light from below the air-sea interface is determined by the nature of the constituents in the water column. In contrast to the absorption spectrum of chemically pure chlorophyll in solution, algae suspensions absorb and scatter light more uniformly throughout the visible part of the electromagnetic spectrum. Because of their spectral absorption and scattering properties, plankton concentration can be estimated by measuring the spectral backscattered radiance over water. Experiments using this approach were performed in upwelling regions along the northwest coast of Africa. Recordings parallel to the coast showed periodic variations in the chlorophyll concentration with the same spacing as the periodicity observed with ERTS-1 data. (See also W74-06619) (Knapp-USGS)

Descriptors: *Remote sensing, Satellites(Artificial), *Strip mining, *Ohio, Surveys, Mapping, Data collections, Vegetation, Soils, Hydrology, Pollutant identification.
Identifiers: *ERTS.

NASA's Earth Resources Technology Satellite (ERTS-1) is sending good quality pictures. Four pictures of different wave lengths (MSS 4, 5, 6, 7) were used in a study of two strip-mine areas in southeastern Ohio. The first area is near Piedmont Lake and the second area is near New Lexington. For the New Lexington area, color infrared pictures taken at an elevation of 18,000 feet were also used for correlation with the ERTS-1 imagery. MSS 5 and 7 are most useful in defining the stripped land and show that the hydrological and soil characteristics are remarkably different from those of the surrounding lands. UTILIZATION OF ERTS-1 DATA TO MONITOR AND CLASSIFY EUTROPHICATION OF INLAND LAKES,
Bendix Corp., Ann Arbor, Mich.
P. E. Chase, L. Reed, and V. E. Smith.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1597-1604, 1973. 3 fig, 1 tab, 5 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Lakes, *Eutrophication, *Limnology, Surveys, Mapping, Data collections, Wetlands, *Michigan, Pollutant identification.
Identifiers: *ERTS.

ERTS imagery was tested for use in estimating and monitoring trophic levels of inland lakes. Preliminary findings are that Michigan lakes and ponds of one acre or more are resolvable in bands 5, 6 and 7 of MSS imagery under fair conditions (haze and 70% cloud cover). In processed imagery, smaller features, including water color patterns, are evident within some lakes of 40 acres or more. Image distortion is minimal; discrimination of lakes and ponds from various wetlands is good. Subsequent ERTS and aircraft imagery will be correlated with detailed ground truth of water color and quality in eutrophic test lakes. (See also W74-06619) (Knapp-USGS)
W74-06698

ERTS-1 OBSERVES ALGAL BLOOM IN LAKE ERIE AND UTAH LAKE,
National Environmental Satellite Service, Washington, D.C.
A. E. Strong.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1605-1612, 1973. 5 fig.

Descriptors: *Remote sensing, Satellites(Artificial), *Eutrophication, *Lake Erie, Algae, Water circulation, Data collections, Currents(Water), Lakes, Limnology.
Identifiers: *ERTS, *Utah Lake.

During late summer when the surface waters of Lake Erie reach their maximum temperature, an algal bloom is likely to develop. Such phenomena have been noticed on other shallow lakes using ERTS-1 and characterize eutrophic conditions. The concentration of the algae into long streamers provides additional information on surface circulations. To augment the ERTS-1 MSS data of Lake Erie, an aircraft was flown to provide correlative thermal-IR and additional multiband photographs. The algal bloom is highly absorptive in the visible wavelengths but reverses contrast with the surrounding water in the near-IR bands. The absorption of shortwave energy heats the dark brown algal mass, providing a hot surface target for the thermal-IR scanner. (See also W74-06619) (Knapp-USGS)

Identifiers: Complexation, Ionic strength, Salt ratios, Toxaphene, EDTA, Errors, Error sources, Method validation.

Increasing emphasis is being placed on the use of bioassay techniques to evaluate potential water quality problems in the aquatic environment. Although the physical environment is carefully maintained, often less emphasis is placed on maintaining the proper chemical environment in bioassay tests. Considerations of oxidation state, solubility, complexation, ionic strength, type and amount of solids, salt ratios and concentrations and organic content are essential in extrapolating the results from the test conditions to the environment. The chemical history of the test organism must be controlled to insure meaningful results, and analytical measurements should be made to insure that the proper chemical species is maintained throughout the test period. If the environmental conditions are not duplicated, studies are needed to determine how the results are dependent on the test environment used. Examples in which changes in the chemical environment of a bioassay test may affect the results of the test are discussed and procedures for minimizing problems of this type are recommended. PHOSPHORIMETRIC DETERMINATION OF TRACES OF BORON,
Geneva Univ. (Switzerland). Dept. of Inorganic and Analytical Chemistry.
M. Marcantonatos, G. Gamba, and D. Monnier.
Analytica Chimica Acta, Vol 67, No 1, p 220-224, November 1973. 3 fig, 2 tab, 5 ref.

Descriptors: *Water analysis, *Sea water, *Boron, Chemical analysis.
Identifiers: *Phosphorimetry, Detection limits, Sample preparation, Chemical interference, Calibration curves.

Micro-amounts of boron in seawater and in solutions containing an interfering metal can be determined using the phosphorescent emissions which occur with the complexation of boric acid by dibenzoylmethane or benzoylacetone. Calibration curves were constructed using standard solutions prepared by heating nanogram quantities of boron as boric acid in sulfuric acid, cooling, and adding ether. Limits of detection were about 0.4 ng B/ml with dibenzoylmethane when emission was measured at 508 nm with a 2-mm dia. phosphorimetric cell and an excitation wavelength of 402 nm. The presence of Cr, Ce, Ni, Cu, Mg, Mn, Pb, Cd, Zn, Sn, Li, Na, K, Al, V, Fe, Co, Ag, Te, Hg, In, Tl, NH_4, F, Br, Cl, I, NO_3, SCN, PO_4, S_2O_3, and CH_3COO ions gave errors of less than 10 percent. Mo and W caused significant interference. Seawater samples were prepared for analysis according to the same procedure used for standard solutions substituting seawater for boric acid. The solutions for analysis should contain no more than 3 percent seawater. (Little-Battelle)

COMPLEXIMETRIC DETERMINATION OF PHOSPHATE,
Alfa Materials Technology, Inc., Pottstown, Pa. Research Lab.
A. De Sousa.
Analytica Chimica Acta, Vol 67, No 1, p 234-235, November 1973. 2 ref.

Descriptors: *Phosphates, *Methodology, *Aqueous solutions, *Pollutant identification, Water analysis, Chemical analysis, Chemical reactions, Volumetric analysis, Color reactions.
Identifiers: *Complexiметric titration, Accuracy, Ionic interference, Chemical interference, EDTA, Chemical indicator, Murexide.

The complexiметric method described for the determination of phosphate ion is based on the rapid quantitative precipitation of silver orthophosphate from a neutral or slightly alkaline phosphate solution. The freshly precipitated silver phosphate is dissolved in an ammoniacal solution of potassium tetracyanonickelate and titrated with EDTA to a visual endpoint with murexide as indicator. The time required for phosphate determination is about 30 min. The method described gave satisfactory results for the determination of phosphate in the range 10.0-150.0 mg; the accuracy varied from 1.0 percent to 0.5 percent over this range. There was no interference from moderate amounts of Al, Ni, Co, Mn, Zn, Cd, Cu, Pb, Ca, Sr, Ba, and Mg, but vanadate, chromate, molybdate, tungstate and halide ions interfered. (Holoman-Battelle)

SELECTRODE - THE UNIVERSAL ION-SELECTIVE ELECTRODE. PART VI. THE CALCIUM (II) SELECTRODE EMPLOYING A NEW ION EXCHANGER IN A NONPOROUS MEMBRANE AND A SOLID-STATE REFERENCE SYSTEM,
Technical Univ. of Denmark, Lyngby. Kemisk Laboratorium A.
J. Ruzicka, E. H. Hansen, and J. C. Tjell.
Analytica Chimica Acta, Vol 67, No 1, p 155-178, November 1973. 11 fig, 3 tab, 39 ref.

Descriptors: *Water analysis, Materials, *Fabrication, Stability, Selectivity, Calibrations, Calcium, Ions, Aqueous solutions, Design criteria, Volumetric analysis, Hydrogen ion concentration, Sea water, *Electrodes.
Identifiers: *Ion selective electrodes, *Calcium electrodes, Calibration curves, Chemical interference, Membrane electrodes, Selectrodes.

The correlation between extraction data and electrode behavior was used to explain the vital properties of organophosphate-based calcium electrodes, and in suggesting a new liquid ion exchanger, di-(n-octylphenyl) phosphoric acid. This compound was synthesized and used in various electrode constructions including a newly developed membrane selectrode with a solid-state inner reference system. The resulting calcium(II) selectrode, calibrated in a series of calcium buffers, was subjected to potential-pH measurements, and used in EDTA titrations. The selectivity parameters of this electrode towards Na(plus), H(plus) and other foreign ions were found to be substantially better than those of any other calcium sensors previously described. (See also W74-06765, W73-01079 and W73-08800) (Little-Battelle)
W74-06764

SELECTRODE - THE UNIVERSAL ION-SELECTIVE ELECTRODE. PART VII. A VALINOMYCIN-BASED POTASSIUM ELECTRODE WITH NONPOROUS POLYMER MEMBRANE AND SOLID-STATE INNER REFERENCE SYSTEM,
Lund Univ., (Sweden).
U. Fiedler, and J. Ruzicka.
Analytica Chimica Acta, Vol 67, No 1, p 179-193, November 1973. 6 fig, 2 tab, 26 ref.

Descriptors: *Potassium, *Water analysis, *Aqueous solutions, Calibrations, Measurement, Volumetric analysis, Selectivity, *Electrodes.
Identifiers: *Ion selective electrodes, Chemical interference, Potassium electrodes, Calibration curves, Membrane electrodes, Selectrodes.

A potassium electrode utilizing a solution of valinomycin in diphenylether and a porous membrane is compared with selectrodes in which the diphenylether has been replaced by a suitable plasticizer and the porous membrane support by a polymer net-work. The development of the polymer membrane allows the use of simplified selectrode construction with a 'solid-state' calomel reference system. Rules for a successful choice of a suitable solvent-polymer combination are suggested and used for development of new polyvinylchloride- and polyurethane-based membranes. (See also W74-06764, W73-01079 and W73-08800) (Little-Battelle)

METHODS OF ANALYSIS FOR MERCURY AND ITS COMPOUNDS: A REVIEW,
Michigan Univ., Ann Arbor. School of Public Health.
R. G. Smith.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 97-136, 1972. 460 ref.

Descriptors: *Mercury, *Analytical techniques, *Pollutant identification, *Bibliographies, Pollutants, Heavy metals, Chromatography, Colorimetry, Fluorescence, Gravimetric analysis, Microscopy, Neutron activation analysis, X-ray analysis, Chemistry, Evaluation, Instrumentation, Testing procedures, Spectrophotometry, *Reviews.
Identifiers: Atomic absorption spectrophotometry.

Papers concerned with mercury analysis are reviewed. The substances most frequently analyzed are organic materials. These present many difficulties because the mercury must be separated from the organic matter for precise measurements by complex ashing or other processes. The methods are divided into two classifications: elemental, total, and inorganic mercury analysis methods; and methods for analysis of organic mercury compounds. The first group contains activation analysis, atomic absorption and fluorescence, chromatographic analysis, colorimetric, electrometric, gravimetric, micrometric, radiometric, spectrographic, titrimetric, x-ray and miscellaneous methods of analysis. The second group contains alkyl and non-alkyl methods. The most widely used methods of mercury determination are those using the introduction of the color-forming reagent, dithizone, and the flameless or 'cold vapor' atomic absorption techniques. A listing of sources includes paper on the various techniques of analysis and additional sources dealing with analytical considerations, errors, calibration procedures, ashing problems and other review articles. (See also W74-06770) (Jerome-Vanderbilt)

PREPARATION OF BIOLOGICAL SAMPLES FOR NEUTRON ACTIVATION ANALYSIS OF MERCURY,
Western New York Nuclear Research Center, Inc., Buffalo.
K. K. S. Pillay.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 137-141, 1972. 3 tab, 2 ref.

Descriptors: *Mercury, *Neutron activation analysis, *Testing procedures, Evaluation, *Organic matter, Pollutants, Heavy metals, Analytical techniques, Sampling, Fish, Gamma rays, Foods, Public health, Metals, *Pollutant identification.
Identifiers: *Biological samples, Gamma rays spectrometry.

Several problems arising out of improper handling of samples can often cause significant losses of mercury in neutron activation analysis of biological and environmental material. The initial findings of an investigation of cold ashing techniques and/or freeze-drying methods to prepare convenient analytical samples of mercury are presented. Analysis of three fish homogenate sam-

ples and human brain tissues was performed using neutron activation analysis without pre-processing, followed by chemical separation and gamma-ray spectrometry. This process showed good agreement with results obtained by cold atomic absorption analysis. Freeze dried samples were reanalyzed and showed an obvious loss of mercury. It seems that neither freeze-drying nor cold ashing procedures are satisfactory for preparation of analytical samples of biological tissues for neutron irradiation. A more effective technique for handling biological tissues which are not subjected to any pre-processing is presented. (See also W74-06770) (Jerome-Vanderbilt)

MERCURY CONTENT OF CANADIAN FOODS AND CEREALS DETERMINED BY DIFFERENT METHODS,
Food and Drug Directorate, Ottawa (Ontario).
H. M. Cunningham, and J. C. Meranger.
In: Environmental Mercury Contamination, Ann Arbor Publishers, Inc., Michigan, p 141-146, 1972. 4 tab.

Descriptors: *Mercury, *Foods, *Analytical techniques, Neutron activation analysis, *Spectrophotometry, Pollutants, Water pollution, Diets, Testing, Laboratory tests, Heavy metals, Absorption, Evaluation, *Pollutant identification, *Canada.
Identifiers: Atomic absorption, Dithizone technique, Spectrophotometry.

Every three months, mixed diet samples representing 12 major classes of foodare collected and analyzed for trace minerals and other constituents by various Canadian organizations. The Association of Official Analytical Chemists analyzed 10 food samples for mercury using a dithiazone technique which revealed that none of the samples contained more than 1 ppm of mercury. The Food and Drug Directorate analyzed wheat and flour samples using a flameless atomic absorption technique. None of the samples tested contained above 0.013 ppm mercury. A comparison of results from flameless atomic absorption analysis and from neutron activation analysis showed discrepancies which could not be accounted for. (See also W74-06770) (Jerome-Vanderbilt)
W74-06787

A SIMPLE, RAPID METHOD FOR THE DETERMINATION OF TRACE MERCURY IN FISH VIA NEUTRON ACTIVATION ANALYSIS,
Michigan Univ., Ann Arbor. Dept. of Chemistry.
J. M. Rottschafter, J. D. Jones, and H. B. Mark, Jr.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 146-151, 1972. 3 tab, 4 ref.

Descriptors: *Fish, *Neutron activation analysis, *Mercury, *Ion exchange, *Pollutant identification, Laboratory tests, Analytical techniques, Heavy metals, Chemical reactions, Evaluation, Instrumentation, Calibration, Foods, Food chains.

A modified version of the neutron activation analysis method employs an anion-exchange column to adsorb mercury as a HgC14 complex. The standard radiochemical technique of adding a hold-back carrier prevents large losses of the sample of mercury during digestion and during the chemical steps preceding ion exchange. Weighed fish tissue samples were irradiated along with a sample used as an internal standard. Samples were then digested, diluted, and passed through an ion exchange column. The resin was removed from the column and counted in order to determine its mercury contents. The results of this method compared favorably with results obtained by other laboratiries using different methods of analysis. The lower level of analysis is estimated to be 10 ppb plus or minus 20%. Bromide ions were found to be the only observable source of interference. Preparation time is lowered to about 10 to 15 minutes per sample through simultaneous running. W74-06788

DETERMINATION OF MERCURY BY NON-DESTRUCTIVE NEUTRON ACTIVATION ANALYSIS,
Environmental Research Group, Ann Arbor, Mich.
R. A. Copeland.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 151-153, 1972. 3 ref.

Descriptors: *Neutron activation analysis, *Laboratory tests, *Mercury, *Pollutant identification, Analytical techniques, Testing, Evaluation, Measurements, Heavy metals, Data collection, Metals, *Non-destructive tests.
Identifiers: Selenium.

A non-destructive neutron activation analysis method, which is useful when it is necessary to make multiple elemental analyses on limited quantities of organic and sediment samples, is outlined. The samples are irradiated, allowed to decay and counted. The data are then stored on magnetic tape and pulse height analyses are performed by computer. A correction method for the interference contributed by selenium-75 is presented which produces less than 20% change in most organic samples which have a mercury concentration of more than 0.5 ppm. The disadvantages of this method are the long instrument and irradiation times required. The advantages are the non-destruction of the substance and the fact that the long measurement periods provide data on approximately 20 elements in addition to mercury. W74-06789

DETERMINATION OF MERCURY IN BIOLOGICAL TISSUES,
Environmental Science and Engineering Corp., Nashville, Tenn.
A. R. Schulert, J. T. Davis, and D. G. Nicholson.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 153-154, 1972.

Descriptors: *Analytical techniques, *Mercury, Spectroscopy, Biochemistry, Fish, Heavy metals, Measurement, Evaluation, Laboratory tests, *Pollutant identification, *Spectrophometry.
Identifiers: *Atomic absorption spectrophotometry, Mercury pollution.

Four published procedures for the atomic absorption analysis of mercury in fish muscle were tested to ascertain their adequacy. The procedure from the Perkin-Elmer Atomic Absorption Manual is inadequate because the radio-tracer added to the system is removed only to the extent of 2-10%. The Association of Official Analytical Chemists procedure, in which the sample is acid-digested, works well for inorganic material but is not effective in measureing mercury in fish. A system of condensation of evolved mercury vapor in a 'cold finger' apparatus was workable although rather expensive, tedious and subject to logistics problems. The most satisfactory procedure involved the combustion of the sample in a 1,000 C furnace under a flow of oxygen, absorbing out water and oxides of carbon and nitrogen, and then measuring the atomic absorption of the mercury vapor. (See also W74-06770) (Jerome-Vanderbilt)
W74-06790

THE DETERMINATION OF ETHYLMERCURY IN BLOOD,
Imperial Chemical Industries, Ltd., Alderly Park (England). Industrial Hygiene Research Lab.
J. C. Gage.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 155-156, 1972. 5 ref.

Descriptors: *Analytical techniques, Separation techniques, *Mercury, *Inorganic compounds, *Organic compounds, Chemical reactions, Chemical analysis, Laboratory tests, Evaluation, Poisons, Pollutant identification.
Identifiers: *Ethylmercury, *Blood analysis.

Methods used in the determination of organic and inorganic mercury in animals have been based upon solvent extraction or the varying lability of different organic mercurials in the presence of an acid-cysteine reagent. In testing the blood of workmen exposed to mercurial seed dressing containing small portions of an ethylmercury salt, difficulty was encountered using the acid-cysteine method. Investigation showed that separate determination of organic and inorganic mercury could be effected, in the presence of a strong solution of stannous chloride in alkali, by first blowing off the mercury from the inorganic salts with nitrogen, then changing to air or oxygen in order to break down the ethylmercury. The area of the tracing obtained with known amounts of ethylmercury chloride indicates that conversion is complete. A limited number of experiments have indicated that methylmercury is much more stable than ethylmercury and attempts to modify the method for the analysis of methylmercury have been unsuccessful. (See also W74-06770) (Jerome-Vanderbilt)
W74-06791

THE DETERMINATION OF MONO- AND DIMETHYLMERCURY COMPOUNDS BY GAS CHROMATOGRAPHY,
Michigan Univ., Ann Arbor. Dept. of Environmental and Industrial Health.
R. Hartung.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 157-161, 1972, 2 fig, 2 tab, 2 ref.

Descriptors: *Analytical techniques, *Gas chromatography, *Mercury, Separation techniques, Chemical reactions, Heavy metals, Organic compounds, Laboratory tests, Research and development, Measurement, *Pollutant identification, Sediments, Anaerobic conditions.
Identifiers: *Methylmercury.

A method for the determination of mono- and dimethylmercury in anaerobic sediments using gas chromatography is presented. The essential step in this method is the initial addition of a cysteine-borate buffer at pH 8.2 to the sample, in order to stabilize the dimethylmercury and to combine with any free monomethylmercury to form the water soluble cysteine adduct. The dimethylmercury is then extracted with toluene, converted to monomethylmercury and measured by electron-capture gas chromatography. This procedure improves the specificity of the test by producing a specific derivative and increases its sensitivity because of the strong electron affinity of methylmercuric bromide. Laboratory procedures and results of some studies using this method are presented. (See also W74-06770) (Jerome-Vanderbilt)
W74-06792

ANALYTICAL METHODOLOGY FOR MERCURY-DISCUSSION PAPER,
H. M. Benedict, J. N. Bishop, C. A. Burns, W. S. Ferguson, and J. C. Gage.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 161-162, 1972.

Descriptors: *Sampling, *Storage, Preservation, *Mercury, Stability, Fish, Analytical techniques, Separation techniques, Chemical reactions, Measurements, *Pollutant identification, Reviews.
Identifiers: *Sample preservation, Methylmercury.

Loss of mercury in sample storage and preparation presents unusual problems. Mercury loss in frozen fish stored in plastic bags was only 10% after a nine month storage period. Mercury in fish seems to be quite stable as long as the specimens have been properly preserved in nonplastic containers. The chelation of mercury from urine and water with ammoniumpyrolidinedithiocarbamate (APDC) and subsequent extraction into methylisobutylketone (MIBK) has been successful. When 0.2 ml of this extract was analyzed by routine atomic absorption techniques, sensitivities of 0.01 ppm to 0.005 ppm were reported. (See also W74-06770) (Jerome-Vanderbilt)

AERIAL RADIOLOGICAL MEASURING SURVEY OF THE AREA SURROUNDING THE ENRICO FERMI ATOMIC POWER PLANT, MONROE, MICHIGAN, SEPTEMBER 1970.
EG and G, Inc., Las Vegas, Nev.
Available from NTIS, Springfield, Va., as ARMS-70-6-7. $4.00 in paper copy, $1.45 in microfiche. Report No ARMS-70-6-7, Sept 1973. 18 p, 3 fig, 3 tab, 3 ref.

Descriptors: *Remote sensing, *Surveys, *Radioactivity, *Monitoring, Rivers, Lakes, Creeks, *Air pollution, Water pollution, Water pollution sources, Nuclear powerplants, Effluents, Contours, Mapping, *Michigan, Food chains, Public health, Population, Radioisotopes, Remote sensing.
Identifiers: Gamma radiation, Sodium cooled fast reactor.

The Aerial Radiological Measuring System (ARMS) was used to survey the Enrico Fermi Atomic Power Plant and surrounding area during September 1970. The survey measured terrestrial background gamma radiation and included a plume track of the stack release gases. A high-sensitivity detection system collected gamma-ray spectral and gross-count data. The data were then computer processed into a map of a 277 square mile area showing isoexposure contours three feet above the ground. Results indicated the presence of isotopes normally found in the background radiation throughout the United States. The plume track revealed no radiation above background levels. (Houser-ORNL)

THE STACK MONITORING SYSTEM AT THE IDAHO CHEMICAL PROCESSING PLANT,
Allied Chemical Corp., Idaho Falls, Idaho. Idaho Chemical Programs Operations Office.
R. C. Girton, L. T. Lakey, and D. T. Pence.
Available from the National Technical Information Service, Springfield, Va., as ICP-1034; $4.00 per copy, $1.45 microfiche. Report ICP-3034, September 1973. 36 p, 6 fig, 1 tab, 8 ref.

Descriptors: *Monitoring, *Control systems, *Idaho, Operations, *Regulation, Effluents, Flow rates, Fuels, Nuclear powerplants, *Air pollution, Measurement, Assay, Radioactivity, Particle size, Migration, Dispersion, Distribution, Filters, Homogeneity, Evaluation, Assessments, Safety, Public health, Fallout, Water pollution sources.
Identifiers: *Fuel processing, *Chemical processing, Fuel elements, Stack.

The effluent monitoring system used to measure airborne particulate emissions from the Idaho Chemical Processing Plant is described in detail. The efficiency of the system has been evaluated through studies of particle migration as a function of size, particulate plateout, particle size distribution, type of filter paper, flow rates, and the homogeneity of the gaseous effluents. Several deficiencies of the system have been identified and recommendations for improvement to meet present and anticipated pollution regulations are presented. (Houser-ORNL)

NEW METHODS OF NITRITE AND NITRATE ANALYSIS FOR NATURAL WATERS,
Wisconsin Univ., Madison. Dept. of Civil and Environmental Engineering.
P. J. Canney.
Available from the National Technical Information Service as PB-231 366, $11.25 in paper copy, $1.45 in microfiche. M.S. Thesis, 1973. 155 p, 34 fig, 21 tab, 38 ref. OWRR A-051-WIS(1). 14-31-0001-3850.

Descriptors: *Organic compounds, *Nitrites, *Nitrates, *Separation techniques, Aromatic compounds, Chemical reactions, *Pollutant identification, Chemical analysis, Water analysis.
Identifiers: *Ortho-diamines, Reagents.

Several aromatic ortho-diamines were found to react with NO2. After optimizing the conditions for these reactions two reagents were selected for method development, namely, 2,3-DAF (2,3-diaminofluroene) and DABSe, (the monopiazselenol of 3,3'-diaminobenzidine). The DABSe reagent was found to have high sensitivity when used with a DCE (1,2-dichlordethane) extraction but could not be used without extraction. A DCE extraction using 2,3-DAF was found to have the highest sensitivity of all the reagents evaluated and had the versatility of use without extraction. Studies showed that Fe(III) and MnO2 could cause significant interference. However, sample filtration was found to eliminate all of the MnO2. High levels of Fe (III) could be removed by use of a cation exchange resin. Attempts to find new NO3 reducing agents which would perform with the new reagents were unsuccessful. The Cd-Hg reduction column was used for NO3 reduction; with analysis with 2,3-DAF or DABSe. The DABSe and 2,3-DAF methods are adequate for NO2 and NO3 analysis. They are highly sensitive and the DAF-aqueous procedure is somewhat simpler than the sulfanilic acid method because of the need for only one reagent addition. The 2,3-DAFaqueous procedure should not be used for water containing high levels of organic material. The potential for using these reagents in NO3 analysis is great if adequate reducing agents can be found. (Chesters-Wisconsin)

EVALUATION OF A MICROWAVE-INDUCED PLASMA SPECTROMETER FOR TRACE ANALYSIS,
Environmental Protection Agency, Athens, Ga. Southeast Environmental Research Lab.
W. R. Seitz.
Copy Available from GPO Sup Doc as EP1.23:660/2-73-009; $0.65; microfiche from NTIS as PB-231 390 $1.45. Environmental Protection Agency, Technical Series Report EPA-660/2-73-009, January 1974. 19 p, 3 tab, 25 ref. ROAP 16ADN-32.

Descriptors: *Analytical Techniques, *Spectroscopy, Microwaves, *Trace elements, Arsenic, Cadmium, Lead, Mercury, *Metals, *Water analysis, *Pollutant identification.
Identifiers: Plasma, Excitation.

A low pressure microwave-induced plasma in helium was evaluated as an excitation source for spectrochemical analysis of trace metals in water. The sample was introduced by evaporating a 5-microliter drop of solution on a wire filament and atomizing the solids by the discharge of a capacitor through the filament. The height of the resulting pulse from the photo detector was automatically recorded. Repeatability was about 10% and detection limits were 1 to 25 pg for As, Cd, Hg, and Pb. Slopes of calibration curves depended strongly on matrix and filament effects and the maximum solids loading of the filament was about 5 micrograms. (Hoover-EPA)

A RADIOACTIVE ISOTOPIC CHARACTERIZATION OF THE ENVIRONMENT NEAR WISCASSET, MAINE: A PREOPERATIONAL SURVEY

IN THE VICINITY OF THE MAINE YANKEE ATOMIC POWER PLANT,
Maine Univ., Orono. Dept. of Physics.
C. T. Hess, C. W. Smith, H. A. Kelley, and F. C. Rock.
Avail: Supt. of Documents, U.S. Printing Office, Washington, D.C., $1.20 per copy. Radiation Data and Reports, Vol 15, No 2, p 39-52, Feb 1974. 1 fig, 7 tab, 14 ref, 3 append.

Descriptors: *Maine, *Monitoring, *Sampling, Air, Soils, *Radioactivity, Uranium, Thorium, Potassium, Cesium, Nuclear powerplants, *Survey, Sediments, Tritium, Precipitation(Atmospheric) measurement, Assay, Instrumentation, *Path of pollutants.
Identifiers: *Montsweag Bay(Maine), Booth Bay(Maine), Young's Creek(Maine).

An environmental radioactivity survey was conducted in the vicinity of the Maine Yankee Atomic Power Plant prior to the operation of this facility. Measurements of environmental radioactivity were made on samples of soil, sediment, well water, surface water, estuarine water, air particulates, air moisture, and precipitation. Natural radioisotopes in the uranium and thorium series and potassium-40 were found in most of the samples. Cesium-137 also was found in some samples. (Houser-ORNL)

(RADIATION DATA, SECTION II. WATER).
Office of Radiation Programs, Washington, D.C.
Avail: Supt. of Documents, U.S. Printing Office, Washington, D.C., $1.20 per copy. Radiation Data and Reports, Vol 15, No 2, p 74-78, February 1974. 2 fig, 1 tab, 4 ref.

Descriptors: *Radioactivity, *Assay, Assessment, Safety, Evaluation, Nuclear explosions, Fallout, *Sampling, Public health, Standards, Water quality, Municipal water, *Water analysis, *Path of pollutants, Potable water.
Identifiers: *Surveillance program, *Nevada Test Site.

The Environmental Protection Agency and other Federal, State, and local agencies operate extensive water quality sampling and analysis programs for surface, ground, and treated water. Most of these programs include determinations of gross beta and gross alpha radioactivity and specific radionuclides. Although the determination of the total radionuclide intake from all sources is of primary importance, a measure of the public health importance of radioactivity levels in water can be obtained by comparison of the observed values with the Public Health Service Drinking Water Standards. These standards, based on consideration of Federal Radiation Council (FRC) recommendations set the limits for approval of a drinking water supply containing radium-226 and strontium-90 at 3 pCi/liter and 10 pCi/liter, respectively. Higher concentrations may be acceptable if the total intake of radioactivity from all sources remains within the guides recommended by FRC for control action. Surveillance data from a number of Federal and State programs are published periodically to show current and long-range trends. Water sampling activities reported in Radiation Data and Reports are listed. Tabular data are given for all analytical results of water samples. (Houser-ORNL)
W74-06856

SEMIMICRODETERMINATION OF MERCURY(II) AND ZINC(II) BY PRECIPITATION FROM HOMOGENEOUS SOLUTION, USING CATION GENERATION TECHNIQUE,
Delhi Univ. (India). Dept. of Chemistry.
K. N. Johri, and K. Bakshi.
Microchemical Journal, Vol 18, No 5, p 497-501, October 1973. 3 tab, 12 ref.

Descriptors: Chemical precipitation, *Mercury, *Zinc, *Gravimeteric analysis, Ions, *Pollutant identification, Heavy metals, Aqueous solutions, Water analysis, *Ion exchange, *Separation techniques.
Identifiers: EDTA, Potassium thiocarbonate, Masking, Ammonium tartrate, Chemical interference.

A gravimetric procedure for the evaluation of milligram quantities of mercury(II) and zinc(II) when present along with adverse ions is based on the technique of masking one or more constituents while precipitating the others. Besides potassium thiocarbonate (PTC), EDTA and ammonium tartrate have been employed as masking agents, thereby affording selective precipitation. In alkaline medium, PTC causes the precipitation of basic thiocarbonates of mercury and zinc. However, by the masking action of EDTA or ammonium tartrate, not only the hydroxide precipitation is prevented but the thiocarbonate precipitate obtained is clean and dense, having better filterable properties. The procedure for the determination of mercury is not applicable in the presence of Bi(III), Pb(II), and Cd(II) ions as the latter ions are also precipitated out with Hg(II). EDTA and ammonium tartrate, when added, prevent the precipitation of Zn(II), Cu(III), Al(III), Mo(VI), As(III), Sb(III), and Sn(II) against mercury(II). Cu(II), Ni(II), and Co(II) remain in the solution as their soluble thiocarbonate complexes with an excess of PTC. Since EDTA masks zinc completely against PTC, it could not be used in the case of zinc. Separations of zinc(II) have been carried out by adjusting the required pH of the solution. In acidic solution, Mo(VI), Sn(II), Sb(III), As(III), Cd(II), Hg(II) ions are separated from alkaline solution by adding an excess of PTC. (Mortland-Battelle)

ELECTRON-DONOR-ACCEPTOR COMPLEXING REAGENTS IN THE ANALYSIS OF PESTICIDES. VI. INFLUENCE OF STRUCTURE IN DETECTION AND IDENTIFICATION,
Dalhousie Univ., Halifax (Nova Scotia). Trace Analysis Research Centre.
J. D. MacNeil, R. W. Frei, and O. Hutzinger.
Mikrochimica Acts, No 5, p 641-650, 1973. 4 fig, 2 tab, 13 ref.

Descriptors: *Pesticides, *Pollutant identification, *Mass spectrometry, Degradation(Decomposition), Colorimetry, *Chromatography.
Identifiers: *Thin layer chromatography, Spray reagents, Electron acceptors, Electron donors, Mass spectra.

Pesticides may be detected following thin layer chromatography by spraying the chromatogram with a reagent which forms a pi complex with the pesticide. The effect of various pesticide structures and substituents in choosing a suitable pi complexing reagent is discussed as well as the effect of these factors in influencing the color of the complex formed. Quantitative analyses may be performed in situ on the thin layer chromatogram and positive identification of the pi complexed compounds may be made by mass spectrometry. The procedure should be applicable for formulation analysis or studies of pesticide decomposition. The sensitivity of these reagents (1-10 micrograms) is not sufficient, however, for them to be regarded as having a useful potential in residue analysis. Their principal use will be in cases where a non-destructive colorimeteric method of detection offers an advantage. (See also W72-05440) (Mortland-Battelle)
W74-06871

ORGANIC FUNCTIONAL GROUP ANALYSIS VIA GAS CHROMATOGRAPY. III. DETERMINATION OF CARBAMATES BY REACTION WITH ALKALI,
Brooklyn Coll., N Y. Dept of Chemistry.
A S Ladas, and T S Ma
Mikrochimica Acta, No 5, p 853-862, 1973. 4 fig, 1 tab, 18 ref.

Descriptors: *Carbamate pesticides, *Gas chromatography, *Alkalis(Bases), Alcohol, *Pollutant identification, Instrumentation.
Identifiers: Methyl carbamate, Ethyl carbamate, Iso-propyl carbanilate.

A gas chromatographic procedure for the analysis of carbamates employs a specially prepared reaction tube, packed with a 10 percent mixture of potassium hydroxide in glass beads, placed inside the injection port of a Perkin-Elmer 900 Gas Chromatograph in front of the chromatographic column packed with Porapak Q.S. A solution of the carbamates (0.01-0.1 micromole) is injected directly into the gas chromatograph. The carbamates are reacted with the alkali present in the reaction tube and the alcohols produced are separated, detected and recorded. Standard calibration graphs of the alcohols are prepared in the same manner and the quantities of carbamates are determined. The procedure is fast and quantitative. (Mortland-Battelle)

METHOD OF PREPARING WASHED SUSPENSIONS OF ANAEROBIC BACTERIA FOR METABOLIC STUDIES,
National Chemical Research Lab., Pretoria (South Africa).
C. Roche, J. Albertyn, and A. Kistner.
Laboratory Practice, Vol 22, No 10, p 633-634, October 1973. 2 fig, 1 tab, 3 ref.

Descriptors: *Anaerobic bacteria, *Centrifugation, Metabolism, Oxidation-reduction potential, Cultures, Laboratory equipment, *Pollutant identification.
Identifiers: *Washed suspensions, Butyrivibrio, Sample preparation.

In preparing washed suspensions of anaerobic bacteria for various microbiological studies, it is essential to avoid any exposure of the organisms to air or oxygen. An apparatus that minimizes the risk of exposure during centrifugation is described along with procedures for its use. Culture vessels were de-aerated using gas mixtures that were passed through a catalytic gas purifier cartridge. Copper and butyl rubber tubing were used to minimize diffusion of oxygen into the purified gas. In producing and maintaining low redox potentials during washing the composition of the reducing solution was arranged to be similar in ionic concentration to the growth medium. Deionized water, which was boiled and prepared under a

blanket of oxygen-free gas, was used for preparing the media and mineral solution. Membrane filtration was also used. All transfers of media and solution were made with sterile syringes. A specific application of the procedure to cultures of Butyrvibrio species is described. (Mortland-Battelle)

STREAM POLLUTION AND A SIMPLIFIED DIVERSITY INDEX,
Oberlin Coll., Ohio.
D. A. Egloff, and W. H. Brakel.
Journal Water Pollution Control Federation, Vol 45, No 11, p2269-2275, November 1973. 2 fig, 3 tab, 22 ref.

Descriptors: *Water pollution, Natural streams, *Bioindicators, *Benthic fauna, Waste water(Pollution), Biological communities, Water quality, Water pollution effects, *Biota, Aquatic animals, Bottom sampling, Invertebrates, Water quality standards, Dissolved oxygen, Physicochemical properties, Water chemistry, Water temperature, Biochemical oxygen demand, Nitrates.
Identifiers: *Species diversity index, Macroinvertebrates, Species diversity, Plum Creek, Fecal coliforms, Orthophosphates.

Biological indexes of diversity of benthic macroinvertebrate communities were determined at seven stations in a stream subjected to pollution by secondarily treated domestic wastewater. Indexes based on three different levels of taxonomic classification (genus, order, and class) all reflected the effect of the discharge on the biological communities. The advantages of using an index of biological diversity based on higher taxonomic categories include (1) direct assessment of the biological impact of pollution, (2) a great savings in time and technical expertise usually required to identify biological specimens to low taxonomic categories, and (3) the retention of some taxonomic information, which is required for making many biological inferences, especially with respect to the effect of pollution on biological food chains. (Holoman-Battelle)

USING ARTEMIA TO ASSAY OIL DISPERSANT TOXICITIES,
National Marine Water Quality Lab., West Kingston, R.I.
E. J. Zillioux, H. R. Foulk, J. C. Prager, and J. A. Cardin.
Journal Water Pollution Control Federation, Vol 45, No 11, p 2389-2396, November 1973. 6 fig, 4 tab, 7 ref.

Descriptors: *Bioassay, Design criteria, *Brine shrimp, Methodology, Sea water, *Toxicity, Eggs, *Assay, Water quality standards, Lethal limit.
Identifiers: *Oil dispersants, Standard methods, Nauplii, Sodium dodecyl sulfate, Sample preparation, *Artemia.

Criteria established for a procedure to assay oil dispersants included the following: (1) The assay must not require special training or skills by a technical level person. (2) Only common laboratory equipment would be required. (3) Materials and time must be minimal. (4) The results must be accurate and available in a short time. (5) The end point must be quantitatively measurable. (6) The organism must be sensitive to chemical changes, yet suitable for laboratory tests. (7) The species must be commercially available, be capable of being raised in the laboratory, and not require care between assays. (8) Large numbers of the organisms must require small volumes of medium. (9) Neither the assay nor the organisms must require a permanent allotment of laboratory space. These criteria were satisifed at least partially by desigining a bioassay procedure which uses nauplii of Artemia salina in synthetic seawater under defined chemical and physical conditions. The brine shrimp are stored as eggs which are incubated and hatched when needed. Sodium dodecyl sulfate is used as a reference toxicant to indicate differences in the condition of organisms that may occur during the test. The procedures were used to compare 48 hr TL sub 50 values of six proprietary oil dispersants with that of sodium dodecyl sulfate. Factors and variations in method that may affect bioassay results are discussed. Conclusions are that Artemia is a suitable bioassay species to determine comparative toxicity of oil dispersant compounds but that it should not be used to determine limiting environmental concentrations for protection of marine life. NEW SPOT TESTS FOR NITRATES AND NITRITES,
Ain Shams Univ., Cairo (Egypt). Microanalytical Research Labs.
S. S. M. Hassan.
Microchemical Journal, Vol 18, No 5, p 486-490, October 1973. 9 ref.

Descriptors: *Nitrates, *Nitrites, *Aqueous solutions, *Chemical analysis, *Pollutant identification, Color.
Identifiers: Detection limits, Chemical interference, Sensitivity.

Nitrates can be determined by placing a drop of the test solution in a microtest tube with aqueous hydroquinone solution and HCl, covering the mouth of the tube with filter paper treated with Griess reagent, and heating. Development of a pink or red spot indicates nitrates. An alternative test involves cooling the aforementioned solution, shaking with ether, and placing one or two drops of this solution on filter paper spotted with tetra base. A blue stain indicates nitrates. The lower detection limit for both procedures is 50 micrograms of KNO3. Nitrites are determined by mixing a drop of test solution on a spot plate with one drop of Griess reagent. Nitrites produce a red color. The detection limit is 5 micrograms of KNO2. Nitrates are identified in the presence of nitrites by adding sodium azide to the test solution before applying one of the previously described procedures. The detection limit is 60 micrograms of KNO3. Nitrites can be detected in the presence of nitrates by the method described. The detection limit is 10 micrograms of KNO2. Further tests were conducted to detect interfering ions. (Little-Battelle)

QUANTITATIVE METHODS FOR PRELIMINARY DESIGN OF WATER QUALITY SURVEILLANCE SYSTEMS,
Raytheon Co., Portsmouth, R. I. Oceanographic and Environmental Services.
S. G. Chamberlain, C. V. Beckers, G. P. Grimsrud, and R. D. Shull.
Water Resources Bulletin, Vol 10, No 2, p 199-219, April 1974. 8 fig, 2 tab, 17 ref.

Descriptors: *Monitoring, *Water quality, *Water pollution control, Network design, Sampling, Cost-benefit analysis, Mathematical models, Data processing, *Indiana, *Illinois.
Identifiers: *Wabash River.

A preliminary phase of the design of water quality surveillance systems is the specification of sampling frequencies and station locations throughout the basin; that is, the development of an adequate space/time sampling plan. Quantitative methods were developed to identify candidate sets of sampling frequencies and station locations, and to establish priorities for implementing the different frequencies and locations. These methods are useful in cost/effectiveness analyses, and are based on the objective of pollution abatement. A spatial priority measure is dependent both on the water quality profile in the stream and on the information obtained from monitoring stations in other streams. A temporal sampling priority rating is a measure of the effectiveness of the surveillance system with respect to its ability to detect the violations in the standards. To illustrate the quantitative methods, the procedures were applied to the Wabash River Basin. (Knapp-USGS)

ANALYSIS OF THE FEASIBILITY OF AN EXPERIMENT TO MEASURE CARBON MONOXIDE IN THE ATMOSPHERE,
General Electric Co., Philadelphia, Pa.
M. H. Bortner, F. N. Alyea, R. N. Grenda, G. R. Liebling, and G. M. Levy.
Available from NTIS, Springfield, Va. 22151 as NASA CR-2303. Printed price $6.25 domestic; $8.75 foreign; $1.45 microfiche. National Aeronautics and Space Administration Contractor Report CR-2303, October 1973. 251 p, 42 fig, 45 tab, 35 ref, 2 append. NASA Contract NASA-10139.

Descriptors: *Air pollution, *Monitoring, *Instrumentation, Data collections, Pollutant identification, Optical properties.
Identifiers: *Carbon monoxide, Interferometers.

Atmospheric carbon monoxide was measured from a remote platform using the correlation interferometry technique. The method is feasible for obtaining a global carbon monoxide map and a vertical carbon monoxide profile. Data can be obtained with an accuracy of 10% using this technique on the first overtone band of CO at 2.3 micrometers. That band is much more suitable than the stronger fundamental band at 4.6 micrometers. Calculations for both wavelengths are presented to illustrate the effects of atmospheric temperature profiles, inversion layers, ground temperature and emissivity, CO profile, reflectivity, and atmospheric pressure. The applicable radiative transfer theory on which these calculations are based is described together with the principles of the technique. (Knapp-USGS)
W74-06917

SILVER CONCENTRATIONS IN ANTARCTIC SNOW AND FIRN,
Nevada Univ., Reno. Desert Research Inst.
J. A. Warburton, G. O. Linkletter, and L. G. Young.
Antarctic Journal, Vol 8, No 6, p 342-343, November-December 1973. 1 tab, 3 ref.

Descriptors: *Precipitation(Atmospheric), *Antarctic, Weather modification, Sampling, Spectrophotometry, Pollutant identification.
Identifiers: *Silver.

A worldwide 'baseline' for silver concentration in precipitation to which other measurements can be compared was made in Antarctica by virtue of its remote location and its high polar ice sheet. Samples were collected with a carefully cleaned stainless steel auger or polyethylene scoop, from pits. The average silver concentration for the antarctic snow and firn samples studied is 8 times 10 to the -13 power g silver per milliliter. This appears to provide an excellent baseline value for silver in precipitation. (Knapp)

PB-210 CONCENTRATION IN ICE MEASURED AT SOUTH POLE STATION,
Centre National de la Recherche Scientifique, Gif-sur-Yvette (France). Centre des Faibles Radioactivities.
J. Sanak.
Antarctic Journal, Vol 8, No 6, p 339, November-December 1973. 1 fig.

Descriptors: *Lead, *Snowpacks, *Antarctic, Precipitation(Atmospheric), Firn, Snow, Ice, Sampling, Lead radioisotopes, *Pollutant identification.

To test for Pb-210 at Amundsen-Scott South Pole Station, firn samples were collected in a 2-meter-deep pit. Each sample represented a 4-centimeter-thick layer of snow and was carefully collected and sealed in a polyethylene bag. Also an ice core was taken at a depth between 2 and 4 meters. The average decrease of the Pb-210 concentration yielded the rate of snow accumulation. The mean annual rate was 10.0 centimeters of water between 1952 and 1971. The variations of the Pb-210 concentration around the average value seem to be important and cannot be attributed to manipulation errors. (Knapp-USGS)

GROUND WATER QUALITY DATA FOR PLANNING, MONITORING AND SURVEILLANCE,
California State Dept. of Water Resources, Sacramento. Div. of Resources Development.
J. L. Welsh.
In: Proceedings of 9th Biennial Conference on Ground Water, Sept 13-14, 1973, Francisco Torres Conference Center, Goleta, Calif: California University Water Resources Center Report No 26, p 58-63, December 1973.

Descriptors: *Water quality, *Monitoring, *Groundwater, Data storage and retrieval, Data processing, Hydrogeology, Data collections, Hydrologic data, *California.

Interpretation of groundwater quality data must rest on a base of reliable knowledge of the geologic structure and the hydrologic regimen. The description of the resource quality must include the quality of each aquifer separately as well as the quality of the produced groundwater. The produced groundwater is a mixture of aquifer waters depending on the location of perforations in the well, aquifer yield characteristics and the pressures in the aquifers perforated. The description must be based on sufficient data to interpolate reliably between data points and present a clear picture of quality of groundwater areally and vertically. A greater problem exists in determining specific data requirements for surveillance of nonpoint or diffuse sources of pollution and to ascertain the effects of controls. A much broader area needs to be monitored because nonpoint sources by their nature affect large areas. The system used in California for processing water-quality data has the capability for retrieving and analyzing the stored data statistically and graphically as well as in standard listing forms. ATOMIC ABSORPTION DETECTOR FOR LIQUID-LIQUID CHROMATOGRAPHY,
Missouri Univ., Columbia. Dept. of Chemistry.
S. E. Manahan, and D. R. Jones, IV.
Analytical Letters, Vol 6, No 8, p 745-753, 1973. OWRR A-056-MO(3). 14-31-0001-3925.

Descriptors: *Chelation, Spectroscopy, *Chromatography, Nitribotriacetic acid, Analytical techniques, *Pollutant identification, *Ion exchange, Cations.
Identifiers: EDTA, *Atomic absorption, Detectors, *Chelating agents.

Because of their role in the solubilization and transport of heavy metal ions and algal nutrient metals, chelating agents are very important in natural waters and wastewaters. They have not been extensively studied, largely because of the lack of analysis methods for them. High-speed liquid chromatography potentially is one of the most useful methods for the analysis of aquatic chelating agents because of its ability to separate species in their natural medium (water). This technique has been handicapped by lack of sensitive and specific detectors. A detector system for chelating agents has been developed. The sample passes through a short column of chelating ion exchange resin bound to copper. An equivalent amount of copper is solubilized from the resin and is aspirated directly into an atomic absorption spectrophotometer set to measure copper. A peak with an area proportional to the amount of chelating agent is recorded. The method is accurate to approximately 3%. As little as 5x10 to the power -7 millimoles of EDTA or NTA can be detected. Interferences from divalent cations can be elminated by exchanging sodium for the divalent cations with an ion exchanger.

AN ATOMIC ABSORPTION ANALYSIS METHOD FOR CYANIDE,
Missouri Univ., Columbia. Dept. of Chemistry.
S. E. Manahan, and R. Kunkel.
Analytical Letters, Vol 6, No 6, p 547-553, 1973. OWRR A-056-MO(2). 14-31-0001-3825.

Descriptors: Pollution, *Cyanide, *Spectroscopy, Plating, Mining, Waste waters, Copper, Sewage, *Pollutant identification, Analytical techniques, Metals, Ions, Methodology.
Identifiers: *Atomic absorption, Stoichiometry, *Complexation, Plating, *Metal ions.

Complexing agents are species which bind to metal ions and generally serve to keep metals in solution. Many significant metals form strong complexes. Among such metals are iron, copper, and mercury. Complexation probably is very significant in the solubilization and transport of heavy metals through natural water systems and waste treatment processes. Therefore, a need exists for the development of methods for the analysis of complexing agents in water. Cyanide ion is a significant complexing agent and is also toxic. It is a common component of mining, metal refining, and plating waste. An atomic absorption analysis method for cyanide is described. The method depends upon the solubilization of copper(II) from an insoluble basic copper salt at pH 10. An amount of copper remaining in solution equivalent to 1/3 of the molar cyanide ion concentration originally present is measured to give cyanide ion concentration. Apparently the complex ion, Cu(CN)3, is the soluble copper complex, and no formation of cuprous cyanide was observed at low cyanide ion concentrations. The method is sensitive down to 2.0x10 to the power -5 M cyanide ion concentration. Reasonable levels of iron do not interfere. The recovery of cyanide from spiked secondary sewage effluent samples is demonstrated.

ORIGIN OF CIRCULAR BEDS OF THALASSIA (SPERMATOPHYTA:HYDROCHARITACEAE) IN SOUTH BISCAYNE BAY, FLORIDA, AND THEIR RELATIONSHIP TO MANGROVE HAMMOCKS,
Virginia Univ., Charlottesville. Dept. of Environmental Sciences.
J. C. Zieman, Jr.
Bull Mar Sci. Vol 22, No 3, p 559-574. 1972. Illus.
Identifiers: *Aerial photography, Bays, *Biscayne Bay(Fla), Burrows, Callianassid, *Florida, Hydrocharitaceae, *Mangrove hammocks, Origin, Peat, Relationship, Rhizophora, Spermatophyta, *Thalassia, Worms, Estuaries.

Comparisons of aerial photographs of a mangrove shoreline and an adjacent estuarine area in southwestern Biscayne Bay, Florida, showed the presence of numerous circular to teardrop-shaped areas. The circular areas on shore are hammocks of mangroves and other tropical trees and they are over depressions in the bedrock which are filled with mangrove peat. The circular areas in the estuary are beds of T. testudinum. These nearly always occur over depressions in the bedrock that are filled with autochthonous mangrove (Rhizophora) peat. The peats reach a pH of 4.9 and a depth of 5 m. Thalassia beds are often surrounded by a white halo fo worm and callianassid burrows in the broken area at the periphery of the depressions in the bedrock. The effect of sediment depth on density and length of blades is shown. Dated mangrove peat from beneath a Thalassia bed 3 m below present sea level was 3680 yr old. In this area the mangrove shoreline receded as sea level rose, and the beds of Thalassia then colonized the planed-off hammocks.--Copyright 1973, Biological Abstracts, Inc.

INVESTIGATION OF BREWING WATER TREATMENT,
A. Totsuka, T. Sumikawa, H. Ogino, Y. Namba, and Y. Komuyama.
Rep Res Inst Brew. 143. p 40-48. 1971.
Identifiers: Ammonia, *Brewing waters(Treatment), Copper, Iron, Manganese, Methodology, Nitrites, Zinc, *Waste water treatment, *Pollutant identification, *Flame photometry.

Collecting the 44 brewing waters treated with various instruments, the changes of components before and after treatment were analyzed by flame photometry for K and Na, atomic absorption spectrophotometery for other metals, and conventional method for other components. To judge water treatments, the standard contents in water were as follows: Fe, Mn, Zn and Cu were less than 0.02 ppm, organic substances determined by KMnO4 consumption were less than 5.0 ppm, and ammonia and nitrite contents were less than 0.04 and 0.01 ppm, respectively. Only 2 samples were treated effectively. The reasons for poor treatments are either mis-management or mis-application of instruments. Celite and other filtration agents do not cause removal of ammonia and metals. Sand filtration must be used in combination with other treatments. Aeration or chlorination-sand filtration methods do not reach the standard level. The Fe bacterial method removes the Fe effectively but other components are not excluded. Active C treatment cannot reach the standard level because of contamination of minerals and the existence of unremovable substances. The manganese zeolite method is insufficient because of leakage of Mn from the packed column. Ion exchange resin is probably the most effective treatment but should be used in combination with other instruments. Though the incomplete growth and breakdown of flocculate occurs, the coagulation method removes Fe; but this method should be used in combination with other instruments.--Copyright 1973, Biological Abstracts, Inc.

THE MERCURY CONTENT OF PREHISTORIC FISH,
Michigan Univ., Ann Arbor. Museum of Anthropology.
E. N. Wilmsen, and J. T. Meyers.
Ecol Food Nutr. Vol 1, No 3, p 179-186. 1972. Illus.
Identifiers: Aplodinotus-grunniens, *Fish, Ictalurus-punctatus, *Mercury, Phylodictis-olivaris, Prehistoric, Channel catfish, Drum, Flathead catfish, Illinois, Apple Creek(Ill), Michigan, *Catfish, Pollutant identification.

Seventeen samples of fish remains were analyzed for Hg content by a neutron activation technique. Three samples were from Apple Creek, a Late Woodland site in central Illinois which is dated shortly after 400 A.D. Five samples were from the Schultz site in Saginaw County, Michigan, a Middle Woodland location slightly older than Apple Creek. The remaining 9 samples were from the

pre-Inca Chilca site located on the central coast of Peru. Freshwater species tested were Ictalurus punctatus (channel catfish), Pylodictis olivaris (flathead catfish), and Aplodinotus grunniens (drum). Five modern samples of these species from streams near Apple Creek were analyzed as a control. Peruvian salt water species have not yet been identified but are probably tuna and anchovy. Samples of the soil matrix in which the Chilca and Schultz specimens were found were also tested. Twelve of the prehistoric samples contained Hg in detectable quantities ranging from 0.014-9.463 ppm. Only one of the modern samples contained detectable Hg and neither soil sample had Hg in detectable amounts. The importance of archaeological data for establishing baselines for modern environmental evaluations is discussed. Implications of these data for modern disposal practices are considered.--Copyright 1973, Biological Abstracts, Inc.

5B. Sources Of Pollution

MERCURY IN THE ENVIRONMENT,
Hope Coll., Holland, Mich. Dept. of Chemistry.
D. H. Klein.
Copy available from GPO Sup Doc as EP1.23:660/2-73-008, $0.65; microfiche from NTIS as PB 231 256 $1.45. Environmental Protection Agency Technology Series Report EPA-660/2-73-008, December 1973. 23 p, 6 tab, 9 ref. EPA Project 16040 FRL.

Descriptors: *Mercury, *Metals, Water pollution, Air pollution, *Water pollution sources, Soil contamination, Sediments, Suspended solids, Path of pollutants, *Michigan, Treatment facilities.
Identifiers: *Air pollution sources, Sewage treatment plants, Coal-burning power plants.

Results are presented of studies of dilute discharges of mercury and some other metals into the characteristically low-metals environment of western Michigan, together with information on the transport of some of these metals through the environment, and on their sinks in the sediments. Atmospheric discharge sources include power plants, airports, asphalt plants, and general urban industrialization. Metals less volatile than mercury are deposited in surface soils near the point of discharge, but only a small portion of the mercury is deposited near the point of discharge. Sewage treatment plants represent a source of discharge of fairly large amounts of mercury-about 1000 lb per million population. This mercury is associated primarily with the suspended solids. In local lakes and rivers, mercury is also associated primarily with the suspended solids. In sediments, the concentrations of mercury and other metals correlate strongly with the organic content and the fraction of fine particulates. (Alford-EPA)

THE IMPACT OF SLIMES-DAM FORMATION ON WATER QUALITY AND POLLUTION,
Department of Water Affairs, Pretoria (South Africa).
T. R. Rudd.
Journal of the South African Institute of Mining and Metallurgy, Vol 74, No 5, p 184-192, December 1973. 6 fig, 10 tab, 4 ref.

Descriptors: Water pollution sources, Impaired water quality, *Coal mine wastes, Pyrite, Sulfate, Fluorides, *Path of pollutants, Toxicity.
Identifiers: *Slimes dams, *Gold mine wastes, Fluorspar, *South Africa, Witwatersrand(So Afr), Natal(So Afr).

Slimes dams have a considerable effect on the quality of water for urban, industrial and mining use in large areas of South Africa, both within and beyond the mining areas where the dams were built. The main mineral pollutants are pyrites (FeS2) associated with gold and coal mining, and fluorspar (CaF2) from fluorspar mines as well as from some coal and iron mines. As fluorspar generally occurs in dolomitic areas there is a danger that it may poison major ground-water resources. The effect of coal mining on 2 typical rivers in Natal is discussed, and the spread of pollutants (sulphates and fluorides) from the Witwatersrand gold mines and their impact on urban and agricultural use of water downstream of the Barrage are illustrated. The diminishing sulphate content of certain tributaries indicates that in time the increase in pollution may be halted or reversed by stricter control over industrial wastes reaching the sewers and rivers, reclamation work on slimes dams and dumps, further leaching of the slimes, and decreased pumping by the mines. THE EFFECT OF POLLUTION ON THE VAAL RIVER BARRAGE AND THE QUEST FOR WATER QUALITY,
Rand Water Board, Johannesburg (South Africa).
R. J. Laburn.
The Civil Engineer in South Africa, Vol 16, No 2, p 62-65, February 1974. 2 fig.

Descriptors: *Water pollution, *Water pollution sources, *Water pollution control, Reservoir operation, Waste water treatment, Water reuse.
Identifiers: *South Africa(Vaal River).

The Rand Water Board supplies water from the Vaal River to a highly industrialized 16,400 sq km area in the Pretoria - Johannesburg-Vereeniging region which generates 60 per cent of the gross national product and has a population of 4 million people. In 1973 the Board supplied an average daily quantity of 1,360 ml/d. Water derived from Vaal Dam upstream of the Barrage is of good quality but accretions between Vaal Dam and the Barrage from tributaries which drain from areas of intensive mining and industrial activity have caused an accelerating increase in dissolved solids, especially sulphates, carbonates and chlorides, and accordingly in chlorine dosage for purification. Possible solutions discussed are the tracing and control of sources of pollution, the separation of different types of polluted water, reuse of sewage effluent, and a dual system of water supply whereby two qualities of water would be provided. Ways of financing these measures are considered. (DWA)

DENITRIFICATION AS A PATHWAY FOR NITRATE REMOVAL IN AQUATIC SYSTEMS,
Purdue Univ., Lafayette, Ind. Dept. of Agronomy.
D. W. Nelson, L. B. Owens, and R. E. Terry.
Available from the National Technical Information Service as PB-231 305, $4.00 in paper copy, $1.45 in microfiche. Indiana Water Resources Research Center, Lafayette, Technical Report No. 42, December 1973. 82 p, 7 fig, 27 tab, 11 ref. OWRR-A-019-IND(3).

Descriptors: *Denitrification, *Anaerobic bacteria, *Lake sediments, *Sediment-water interface, *Nitrates, Nitrites, Dissolved oxygen, Anaerobic conditions, Organic compounds, Carbon, Sediments, Nitrogen, Isotopes.
Identifiers: Glucose, Organic carbon, N-15 isotope.

Denitrification was determined by decrease in total nitrogen in a water media or by a decrease in N-15 labelled nitrate in sediment systems. It was established that the numbers of denitrifying bacteria, pH, and nitrate concentration of most surface waters will support denitrification. The process is inhibited by high dissolved oxygen and low dissolved organic carbon. Low temperature also restricts denitrification. River water samples exhibited denitrification when amended with glucose and nitrate under anaerobic conditions, whereas, pond waters did not. The findings indicated that denitrification in the water phase is insignificant to the nitrogen status of most streams and lakes. However denitrification in sediments may result in a large removal of nitrate from aquatic systems each year. Due to the large denitrifying capacities of sediments, it seems likely that denitrification is limited primarily by the relatively low amounts of nitrate entering the sediment by seepage through the lake bottom or by diffusion of nitrate from the overlying water in response to a concentration gradient.

UNRECORDED POLLUTION AND DYNAMICS OF BIOCHEMICAL OXYGEN DEMAND,
Rutgers - The State Univ., New Brunswick, N.J.
W. Whipple, Jr., J. V. Hunter, S. L. Yu, J. P. Hewitt, and J. Cirello.
Available from the National Technical Information Service as PB-231 306, $4.00 in paper copy, $1.45 in microfiche. New Jersey Water Resources Research Institute, New Brunswick, March 1974, 77 p, 20 fig, 22 tab, 48 ref. OWRR A-025-NJ(4). 14-01-0001-3030.

Descriptors: *Water pollution sources, Water quality, *Biochemical oxygen demand, *Urban runoff, Water quality control, Nutrients, Oxygen demand, Urban areas, *New Jersey, Model studies.
Identifiers: Unrecorded pollution, *Non-point pollution sources, *Oxygen demand kinetics, *Water quality models, *Morristown(N.J.).

Results are presented of a four year investigation of the dynamics of biochemical oxygen demand in polluted streams, and of unrecorded origins of such pollution. Data were obtained from watersheds of differing characteristics, including undeveloped woodlands, row crops, single family suburban housing and urban areas. Samples were taken over about a 2 1/2 year period, and analyzed for both 5 day and longer period BOD. It was found that single family suburban housing and row crops in flat land provide only a moderate increase of organic pollution over the undeveloped areas; but that urban watersheds tested are major pollution sources. Very large increases in pollution loading were found for days of rainfall as compared to dry days. A special study of Morristown, N.J. provided a provisional measure of per capita organic pollution to be expected in a clean urban area without major industrial activities. Frequency distributions of the BOD concentrations were prepared. Also seasonal variations of the BOD loadings indicate that loadings much higher than annual average values could be expected for

spring and early summer months. Studies were made of the variation of biochemical oxygen with time, in order to apply to the water quality modelling of polluted streams. The classic first order model was found not to represent the actual situation very adequately. Other equations which have been suggested were also tested. Finally a new equation was derived which proved to be statistically more satisfactory, and relatively simple to apply. Certain new concepts are suggested for the application of BOD data to water quality modelling of polluted streams. (Whipple-Rutgers)
W74-06613

CHLORINE PRODUCTION DROPS AS DEMAND LAGS.
Chemical and Engineering News, Vol 49, No 46, p 10-11, November 8, 1971. 2 fig.

Descriptors: *Chlorine, *Industrial production, *Industrial wastes, *Mercury, Water pollution, Plastics, Solvents, Pulp and paper Industry, Air pollution, Pollution abatement, *Demand.

The annual production of chlorine has been dropping from 6-7% per year. The reason is that chlorine's largest markets, including vinyl chloride, chlorinated solvents, and paper production face declining business. The mercury pollution problem has had little effect on chlorine capacity. Only two plants out of 30 reporting had stopped using mercury. Loss of mercury in water wastes has been reduced on an industry average to 2% of the January 1, 1970 level. Chlorine producers are now working to reduce emissions of mercury to the atmosphere. One plant had to shut down, being unable to cope with the problem. The mercury cell use is declining. Most new plants will probably use diaphragm cells. (Oleszkiewicz- Vanderbilt)

ENVIRONMENTAL MERCURY CONTAMINATION.
Ann Arbor Science Publishers, Inc., Ann Arbor, Michigan, 1972, R. Hartung and B. D. Dinman, editors. 349 p.

Descriptors: *Mercury, *Environmental effects, *Analytical techniques, *Public health, Pollutants, Water pollution, Air pollution, Soil contamination, Wastes, Effluents, Toxicity, Agricultural chemicals, Organic compounds, Inorganic compounds, Chemical reactions, Poisons, Distribution patterns, Fish, Bioassay, Birds, Laboratory tests, Path of pollutants, Food chains, Sediments, Aquatic life, Pathology, Biochemistry.

This volume is a compilation of much of the available knowledge on the subject of mercury contamination. Papers were presented at the International Conference on Environmental Mercury Contamination, held in Ann Arbor, Michigan, September 30, 1970-October 2, 1970. Discussion material has been added to most of these papers to improve their content and readability. A comprehensive coverage of the topic is presented by dividing the papers into four groups: the occurrence of mercury in the environment and man; methods of analysis; environmental dynamics of mercury; and the biological effects of mercury compounds. W74-06770

SOURCES OF MERCURY IN THE ENVIRONMENT,
Michigan State Univ., East Lansing. Inst. of Water Research.
F. M. D'Itri.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 5-25, 1972. 76 ref.

Descriptors: *Water pollution sources, *Mercury, *Agricultural chemicals, *Chemical wastes, *Industrial wastes, *Fossil fuels, Pollutants, Wastes, Toxins, Metals, Effluents, Heavy metals, Sewage effluents, Organic compounds, Inorganic compounds, Metallurgy, Water quality control, Electrical equipment, Environmental effects, Air pollution, Coals.
Identifiers: *Methylmercury, Phenylmercury, Chlor-alkali production.

Two major sources of mercury are named; the natural occurrence of elemental mercury found in the earth's crust, and the mercury introduced into the environment from various human activities. Based on 1968 statistics, the largest industrial consumptions of mercury were in the electrical apparatus (26.6%) industry, industrial control instrument manufacture (10.6%), the manufacture of chlor-alkali products (23.1%), and in the phenyl mercury derivatives used in paint manufacturing (14.4%). Other areas of mercury consumption included agricultural slimicides, dental preparations, and metallurgical processing. The total amount of mercury consumed in 1968 was over 5.7 million pounds. Mercury enters the environment directly from nearly all the manufacturing processes, resulting from a failure to utilize the appropriate pollution abatement systems, and through the use of agricultural products containing organo-mercuric compounds. Indirect introduction of mercury into the environment results from the use, misuse and disposal of industrial and consumer products containing mercury. Fossil fuels also contain small amounts of mercury which account for a considerable amount of mercury released because of the use of large quantities of these substances. (See also W74-06770) (Jerome-Vanderbilt)

SOME ESTIMATES OF NATURAL LEVELS OF MERCURY IN THE ENVIRONMENT,
Hope Coll., Holland, Mich. Dept. of Chemistry.
D. H. Klein.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 25-29, 1972. 1 fig, 7 ref.

Descriptors: *Mercury, *Estimating, *Sampling, *Distribution patterns, Pollutants, Air pollution, Water pollution, Soil contamination, Statistics, Data processing, Geochemistry, Transfer, Lakes, Ponds, Streams, Atmosphere, *Path of pollutants.

It is estimated that natural weathering, including river and stream transport, transfers mercury through the environment at a rate of about 5000 tons per year. Another 5000 tons per year is estimated to be involved in manmade transport systems. It is important to know the natural levels of mercury in the environment in order to calculate the amount of mercury contamination due to human activities. Air pollution study readings taken at an elevation of 10,000 ft about 20 miles offshore from the San Francisco Bay region gave mercury concentrations averages slightly below 1 ng/cubic meter. Atmospheric measurements over land ranged from 1 to 50 ng/cu.m. with the average level being 3 ng/cu.m. and high levels in industrial or mining areas. Soil samples from the St. Clair industrial region indicate that atmospheric mercury transport is highly dependent upon wind and rain factors. Data from 67 samples taken from fresh water lakes, ponds, and rivers in the northeastern U.S. are presented as a concentration frequency diagram. The mean level is about 0.05 ppb, while the values are up to 2.8 ppb. The figures presented are subject to further refinement since natural levels are likely to vary with the geology of a given region. (See also W74-06770) (Jerome-Vanderbilt)

THE MERCURY POLLUTION PROBLEM IN MICHIGAN,
Michigan Dept. of Natural Resources, Lansing. Water Resources Commission.
W. G. Turney.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 29-31, 1972.

Descriptors: *Mercury, *Michigan, *Industrial wastes, *Water pollution sources, *Algicides, Pollutants, Air pollution, Soil contamination, Water pollution, Heavy metals, Soil, Lakes, Rivers, Coals, Analysis, Chemical analysis, Atmosphere, Electric power industry.

Possible sources of environmental mercury contamination in Michigan were investigated. The Wyandotte Chemical Company was found to be discharging from 10 to 20 pounds of mercury per day, while a small General Electric plant released approximately 1500 pounds of elemental mercury per year into the local environment. Although there was a fishery in the area near the G. E. Plant, no damage was found. Phenylmercury acetate was used by many communities and industries as an algicide and slimicide in air conditioning cooling towers but it is no longer used or manufactured in Michigan. Seals and other equipment in water treatment facilities contain some mercury which could be of some danger as contaminating agents. Coal from southeastern Ohio which is used by two Michigan power companies was analyzed and found to contain 0.5 ppm mercury. Since an analysis of power plant ash indicates insignificant mercury content it was concluded that this mercury was released into the atmosphere. (See also W74-06770) (Jerome-Vanderbilt)
W74-06773

MERCURY IN FISH IN THE GREAT LAKES,
Michigan Dept. of Natural Resources, Lansing. Fish Div.
J. D. Bails.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 31-37, 1972. 5 fig, 2 ref.

Descriptors: *Mercury, *Water pollution sources, *Sampling, Chemical analysis, *Fish, *Lake Michigan, *Lake Erie, Pollutants, Heavy metals, Data collections, Analytical techniques, Rock bass, Walleye, Catfish, Yellow perch, Chemical wastes, Great Lakes, Path of pollutants, Food chains.
Identifiers: *Lake St. Clair.

Sampling of fish in the Great Lakes region has been practiced since it was first discovered that mercury was a hazard. However, extensive sampling was initiated only after the Lake St. Clair incident in March 1970 when Canada announced that 12,000 pounds of walleye from Lake St. Clair were to be destroyed because of mercury contamination. Until 1970 a random approach was taken to determine the species the number of fish which exceeded 0.5 ppm mercury. This did not provide the data on a given species which is necessary for understanding of the problem. In July 1970 sampling stations were established in Michigan waters along with standards for sample size, species and portions to be analyzed. Walleye, yellow perch, catfish and rock bass were chosen as index species. The highest levels of mercury were found in walleye from Lake St. Clair while lower levels were found in walleye from lake Erie. Mercury concentrations in walleye ranged from a high of 3 ppm to 1 ppm. The pattern was the same for yellow perch with values ranging from 2.2 ppm to 0.2 ppm. Several factors which complicate the evaluation of data are listed. Although a decline in the level of mercury pollution should be detected with the passage of time, the fish taken from Lake St. Clair will not be suitable for human comsumption for a number of years. (See also W74-06770) (Jerome-Vanderbilt)
W74-06774

SURVEY OF MERCURY CONCENTRATIONS IN FISHES OF LAKES ST. CLAIR, ERIE, AND HURON,
Bureau of Commercial Fisheries, Ann Arbor, Mich. Technological Lab.
R. A. Greig, and H. L. Seagran.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 38-45, 1972. 3 fig, 5 tab.

Descriptors: *Mercury, *Distribution patterns, *Lake Huron, *Lake Erie, *Fish, *Sampling, Pollutants, Water pollution, Heavy metals, Great Lakes, Walleye, Drums, White bass, Yellow perch, Bioindicators, Data processing, Analysis.
Identifiers: *Lake St. Clair.

Findings are summarized of a preliminary survey of mercury concentrations in fish collected over the period from March 27 to May 8, 1970 from the U.S. waters of Lakes Erie, Huron, and St. Clair. These findings are related to geographic area and species differences. Data from Lake St. Clair show that essentially all the fish examined contained mercury concentrations considerably in excess of the U.S. Food and Drug Administration's 0.5 ppm 'action level'. In Lake Erie, samples of walleye, drum, white bass, and yellow perch were taken from the eastern, central and western basins and compared for mercury concentration. Walleye from the western basin contained the highest concentration at 1.5 ppm, while drum from the central basin contained the lowest concentration at 0.2 ppm. Tables list several species of fish, ranked on a scale according to the amount of mercury contained in their tissues. A comparison of the contamination of the three lakes was made using yellow perch as a biological indicator. The highest mercury levels were found in Lake St. Clair and the extreme western portion of Lake Erie, while Lake Huron samples showed relatively lower concentrations. (See also W74-06770) (Jerome-Vanderbilt)
W74-06775

MERCURY IN WILD ANIMALS, LAKE ST. CLAIR, 1970,
Bureau of Sport Fisheries and Wildlife, Laurel, Md. Patuxent Wildlife Research Center.
E. H. Dustman, L. F. Stickel, and J. B. Elder.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 46-52, 1972. 3 tab, 6 ref.

Descriptors: *Mercury, *Bioindicators, *Waterfowl, *Path of pollutants, Pollutants, Water pollution, Heavy metals, Biology, Analysis, Analytical techniques, Birds, Reproduction, Data collection, Evaluation, Toxins, Spectrophotometry, Methylation, Atomic absorption spectrophotometry.
Identifiers: *Lake St. Clair.

A preliminary assessment of mercury residues was made for samples of body tissues, eggs and food items removed from the stomachs of water fowl of 4 species, 11 other species of birds, garter snakes and 2 species of frogs taken from the area around Lake St. Clair. Analysis for total mercury was made employing atomic absorption spectrometry with a 'boat modification'. Results, expressed on a wet weight basis, are presented in tables. Mercury residues in many birds appeared to be undesirably high when compared to known harmful amounts. The residues found in tissues of fisheating birds (blue herons and common terns) far exceeded those in other species and were within the range found to be fatal in laboratory experiments. Eggs were found to contain residues of a level considered harmful to reproduction. Since many of these birds are migratory, mercury from Lake St. Clair will find its way to areas far from the source. W74-06776

MERCURY CONTENTS OF BOTTOM SEDIMENTS FROM WISCONSIN RIVERS AND LAKES,
Wisconsin Dept. of Natural Resources, Madison.
J. G. Konrad.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 52-58, 1972. 1 fig, 1 tab, 6 ref.

Descriptors: *Wisconsin, *Mercury, Rivers, *Sediments, *Distribution patterns, Pollutants, Water pollution, Water pollution sources, Heavy metals, Wastes, Industrial wastes, Sampling, Analytical techniques, Bottom sediments, Clays, Sands, Silts, Sewage effluents, Spectrophotometry, Lakes.
Identifiers: *Methylation, Atomic absorption spectrophotometry.

A survey was conducted during the spring of 1970 to determine the location of mercury deposits and elucidate the natural background levels in bottom sediments of lakes and rivers. Samples were collected from 168 locations of 27 rivers and streams which were chosen to reflect discharges of various municipal and industrial wastes and to determine background levels. Flameless atomic absorption analysis was used. Background levels ranged from <0.01 ppm to 0.05 ppm in sandy sediments and from 0.05 ppm to 0.15 ppm in organic and clay sediments. Industrial and municipal systems discharge significant amounts of mercury resulting in high concentrations in some areas; up to 684 ppm in one place. It appears that various water and sediment characteristics, such as pH, control and release of mercury from the bottom sediments. Sludge and effluents from some treatment facilities were also analyzed to determine their contribution to mercury contamination of the environment. The discharge of mercury from a large municipal treatment facility may be as high as 0.5 pounds per day. Public water supplies were found to contain no detectable amounts of mercury. All bottom sediments contain at least a trace of mercury. (See also W74-06770) (Jerome-Vanderbilt)
W74-06777

MERCURY LEVELS IN WISCONSIN FISH,
Wisconsin Dept. of Natural Resources, Madison.
S. J. Kleinert.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 58-70, 1972. 1 fig, 1 tab, 7 ref.

Descriptors: *Mercury, *Path of pollutants, *Fish, *Industrial wastes, *Wisconsin, Pollutants, Water pollution, Water pollution sources, Heavy metals, Walleye, Suckers, Bioindicators, Analytical techniques, Evaluation, Sampling, Spectrophotometry, Sediments, Pulp wastes.
Identifiers: Chor-alkali industry.

A survey was conducted during the spring of 1970 to determine mercury residue levels in fish from a variety of waters in Michigan. Although suckers, goldfish and walleye were the most frequently sampled species, up to 20 different types of fish are included in the survey, representing the population of Wisconsin waters. Determination using atomic absorption spectrometry was done on 1,116 samples representing 2,144 fish taken from 103 locations. Mercury levels in fish taken from water remote from any known source of mercury averaged 0.19 ppm mercury and the values ranged from 0.01 ppm to 0.60 ppm. Different species contained various amounts of mercury and, generally, larger fish had higher concentrations than smaller fish. Fish containing an average of over 0.5 ppm mercury were taken from three areas and public warning was issued for the areas. In general, higher levels of mercury residue were found in fish exposed to waste water discharged from pulp and paper mills and chlor-alkali plants. Mercury is being replaced by a safer substance in the wood processing plants but deposits of mercury in sediments will continue to contaminate for a number of years. (See also W74-06770) (Jerome-Vanderbilt)
W74-06778

MERCURY IN THE LAKE MICHIGAN ENVIRONMENT,
Environmental Research Group, Ann Arbor, Mich.
R. A. Copeland.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 71-76, 1972. 4 fig, 4 ref.

Descriptors: *Mercury, *Plankton, *Sediments, *Lake Michigan, *Distribution patterns, Pollutants, Water pollution, Air pollution, Water pollution sources, Heavy metals, Analysis, Metals, Aquatic microorganisms, Phytoplankton, Zooplankton, Plankton nets, Benthos, Great Lakes, Runoff.

During 1969-70 the Great Lakes Research Division of the University of Michigan established a grid of 21 stations on Lake Michigan, where samples of phytoplankton, zoolplankton, benthos, water and sediments were taken for analysis of 30 elements including mercury. The average value of mercury for phytoplankton was 2.2 ppm, for zooplankton 0.9 ppm and for benthos 1.4 ppm, dry weight. Wet weight values would be approximately 0.44, 0.2, and 0.3 ppm, respectively. As these values were below the 0.5 ppm maximum permissible concentration it appeared that Lake Michigan was still relatively free of mercury contamination. No isolated sources of mercury entering the lake were found. The low concentrations in the southern end of the lake indicated that contamination from airborne mercury resulting from the burning of fossil fuels was negligible. The mercury in the lake was assumed to result from surface runoff as values along the shore are higher than in the center of the lake. (See also W74-06770) (Jerome-Vanderbilt)
W74-06779

INVESTIGATION OF MERCURY CONTAMINATION IN THE TENNESSEE VALLEY REGION,
Tennessee Valley Authority, Chattanooga.
O. M. Derryberry.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 76-79, 1972. 2 fig.

Descriptors: *Mercury, *Data, *Analysis, *Fish, *Tennessee Valley Authority, Pollutants, Water pollution, Water pollution sources, Heavy metals, Metals, Sediments, Management, Reservoirs, Virginia, Alabama, Streams, *Industrial wastes.
Identifiers: Pickwick Reservoir(Ala), North Fork Holston River(Va), Chlor-alkali industry.

Mercury compounds in water resulted in fish-kills in the Tennessee Valley in July 1968 and in the spring of 1969. Action was taken by the Tennessee Valley Authority to analyze samples of fish, water and sediment from 26 reservoirs, and 4 stream reaches. Mercury was found only in Pickwick Reservoir in northern Alabama and the North Fork Holston River in southwest Virginia. Although mercury levels in fish from the Pickwick Reservoir reach 2.4 ppm, the mercury concentration in the water was found to be below the standard of 5.0 ppb proposed by the U.S. Public Health Service. Both areas were closed to fishing. The major sources of mercury in the Tennessee Valley were 3 large caustic-chlorine plants which have taken action to eliminate the mercury discharges. The TVA will continue to monitor the water in that area. Two maps show sampling points and indicate areas of contamination. (See also W74-06770) (Jerome-Vanderbilt)
W74-06780

DISTRIBUTION OF MERCURY IN THE ENVIRONMENT OF MINAMATA BAY AND THE INLAND ARIAKE SEA,
Kumamoto Univ. (Japan). Medical School.
T. Takeuchi.

In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 79-81, 1972. 1 fig, 2 ref.

Descriptors: *Distribution, *Mercury, *Sediments, *Industrial wastes, Pollutants, Water pollution, Water pollution sources, Metals, Heavy metals, Fish, Shellfish, Measurements, Patterns, Evaluation, Crabs, Food chains, Animal pathology, Pathology, Toxins, Crabs, Lobsters.
Identifiers: *Japan(Minamata Bay), Methylation, Poisoning.

In 1959 investigations suggested that mercury was the agent responsible for Minamata disease. The sediments and aquatic life of Minamata Bay were found to have high concentrations of mercury. Sediment from a drainage channel which led to the bay from several chemical plants contained a maximum mercury concentration of 2010 ppm (wet weight). The concentration dropped sharply with distance from the point of discharge, to concentrations of 40 to 59 ppm in the central portion of the bay. At the mouth of the bay which leads to the sea, concentrations were 22 ppm at 1 km and 12 ppm at 1.5 km from the point of discharge. Sediments directly outside Minamata Bay contained only 0.4 to 3.4 ppm Hg. Fish and seafoods caught in the Bay contained from 1 to 36 ppm Hg; the same seafoods outside the Bay in the Shiranue Sea contained from 1-13.5 ppm Hg; and in similar catches in other uncontaminated Japanese waters concentrations never exceeded 1 ppm Hg. W74-06781

MERCURY LEVELS IN A SAMPLE OF MICHIGAN RESIDENTS,
Michigan Dept. of Public Health, Lansing.
K. R. Wilcox, Jr.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 82-85, 1972. 4 tab.

Descriptors: *Mercury, *Food chains, *Public health, Pollutants, Water pollution, Heavy metals, Path of pollutants, Analytical techniques, Bioindicators, Laboratory tests, Pathology, Biochemistry, *Michigan, Great Lakes, Fish, Toxins, Neutron activation analysis, Foods.
Identifiers: *Methylmercury poisoning, *Lake St. Clair.

Twenty-four individuals who frequently ate fish taken from Lake St. Clair were tested for mercury concentrations in their urine with generally negative results. Twenty similar individuals were tested for mercury in their blood. The values, expressed in ng/ml, ranged from 7 to 51.5, with a mean of 17.8. The men had a mean of 22 ppb, while the women had a mean of 12.8 ppb. For the 6 individuals who were still eating fish at the time of the test, the mean was 26.6 ppb while for the 14 who had stopped eating fish two months before, the mean value was only 14.1 ppb. Additional test were performed on samples of hair, showing that there were higher levels of mercury in those persons who had continued to eat fish. The difference in average levels between those who continued to eat fish and those who stopped was consistent with the half-life of excretion of methylmercury. (See also W74-06770) (Jerome-Vanderbilt)
W74-06782

MERCURY IN HUMANS IN THE GREAT LAKES REGION,
Ontario Dept. of Health, Toronto. Environmental Health Services Branch.
E. Mastromatteo, and R. B. Sutherland.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 86-90, 1972, 1 tab.

Descriptors: *Fish, *Public health, *Great Lakes, *Foods, Water pollution, Water pollution sources, Heavy metals, Environmental effects, *Mercury, Human pathology, Bioindicators, Laboratory tests, Paths of pollutants, Biochemistry, Chemical analysis, Neutron activation analysis, Food chains, Canada.
Identifiers: Tolerance levels, Blood, Hair, Urine specimens.

Results from investigations of mercury accumulation in humans are reported. One-hundred-thirty-five residents of the Great Lakes region were tested for mercury concentrations in their urine, with results within the normal range of mercury excretion. Samples of hair, blood and urine as well as histories of fish consumption were taken from 30 individuals in northwestern Ontario. Generally, those who did not eat fish from contaminated waters had the lowest mercury concentration in their hair while those who ate fish from contaminated water had higher concentrations up to 96 ppm, in their hair. The mercury in hair correlated with the number of meals of fish consumed per week. The 9 persons who did not eat contaminated fish had mercury levels below 35 ppb in their blood, while most values for those who ate contaminated fish ranged from 20 to 80 ppb and one individual had a level of 155 ppb. It is believed that the problem of mercury contamination is more widespread than first assessed and that some high concentrations in areas far from industry may result from natural mercury deposits. THE OCCURRENCE OF MERCURY IN THE ENVIRONMENT AND MAN, DISCUSSION PAPER,
Michigan Dept. of Natural Resources, Lansing.
J. Bails, T. W. Clarkson, H. M. Cunningham, W. Fulkerson, and L. Goldwater.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 90-92, 1972, 3 ref.

Descriptors: *Mercury, *Watersheds(Basins), *Diets, Pollutants, Water pollution, Water pollution sources, Heavy metals, Environmental effects, Sediments, Fish, Distribution, Foods, Testing, Analytical techniques, Fossil fuels, Toxicity.
Identifiers: Tolerance level.

Some mercury has been found in sediments throughout the major watersheds of the United States. In places where no industrial sources were evident, as much as 4 ppb mercury were found in the effluents of waste treatment plants. Although methods of detection of mercury are available, there is some question as to the precision of available analytical techniques in assessing low levels of mercury contamination. The average dietary intake of mercury ranges from 5 to 20 micrograms per day. Fish seem to be the major source of dietary mercury. Fruits and vegetables contain mercury at about 20 to 50 ppb, beef and pork contain about 50 to 140 ppb, liver and kidney contain 100 to 200 ppb, and dry milk powders, about 140 ppb (dry weight). Normal cooking procedures do not reduce methylmercury content. Human hair is being used as an indicator of mercury in humans in some studies, and values from 3 to 6 ppb are considered typical for 1970. Some data on the extreme mercury levels in blood and hair in North America are considered to be at the low toxic limit by Swedish investigators, giving cause for concern. (See also W74-06770)

FACTORS IN THE TRANSFORMATION OF MERCURY TO METHYLMERCURY,
Institute for Water and Air Pollution Research, Stockholm (Sweden).
A. Jernelov.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 167-172, 1972, 2 ref.

Descriptors: *Mercury, *Water pollution, Aerobic conditions, Hydrogen ion concentration, Pollutants, Heavvy metals, *Chemical reactions, Aquatic environment, Environmental effects, Sediments, Anaerobic conditions, Microbial degradation, Bacteria, Fungi, Oxidation, Surface waters.
Identifiers: *Methylation, *Methylmercury, *Sweden.

A discussion of the transformation of bivalent inorganic mercury, elemental mercury and phenylmercury into methylmercury and its movement through the aquatic environmental is presented.

The main factors considered are the oxidation of elementary mercury, the methylation of mercuric sulfide, the effects of sediment on the conversion of mercury, the effects of pH, anaerobic and aerobic conditions, and the long term effects of mercury in water. The three major mercury compounds released into the aquatic environment generally move into the sediments first. The oxidation of elemental mercury occurs in most fresh waters, converting it to bivalent mercury. In the sediments the general microbiological activity is related to the methylation of mercury. Methylation in fresh water appears to be higher under low pH, aerobic conditions, but methylation also occurs under anaerobic and higher pH conditions. It seems that mercury remains in sediments and in the aquatic environment long after its introduction. Proposed methods of speeding the recovery of mercury from the environment do not appear feasible at this time. (See also W74-06770) (Jerome-Vanderbilt)
W74-06794

THE ROLE OF FOOD CHAINS IN ENVIRONMENTAL MERCURY CONTAMINATION,
Michigan Univ., Ann Arbor. Dept. of Environmental and Industrial Health.
R. Hartung.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 172-174, 1972. 1 fig.

Descriptors: *Toxins, *Mercury, *Food chains, *Path of pollutants, *Biological communities, Pollutants, Food pyramids, Organic compounds, Inorganic compounds, Transfer, Movement, Stability, Solubility, Public health, Biochemistry.
Identifiers: Methylmercury, Biological half-life.

Although not completely understood, the transport of toxic substances through the food chain is of major concern because those species which occupy the peak, such as predatory animals and man, may receive inordinately high exposure to those substances. The critical analysis of the food chains and their role in the biological dynamics of mercury is complex because of the large number of mercury compounds which occur in the environment under appropriate natural conditions. The basic conceptual components in the concentration of toxicants in the food chain are the absorption routes and efficiency of toxicant travel into the body, the concentration factor of the toxicants in ratio to total body burden, the biological half-life determined from excretion and metabolism, and the ecological community structure which transports the substance. The different mercury compounds (HgS, Hg(++), RHg (+), and RHgR(+) in the environment have different solubilities, stabilities and lipid-water partition coefficients, resulting in different transport characteristics. The analysis of total mercury is an oversimplification of the problem and much more study of the subject is needed. (See also W74-06770) (Jerome-Vanderbilt)

MERCURY AND FOOD CHAINS,
Institute for Water and Air Pollution Research, Stockholm (Sweden).
A. Jernelov.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 174-177, 1972, 1 ref.

Descriptors: *Path of pollutants, *Food chains, *Mercury, *Birds, *Fish, Pollutants, Seed treatment, Animal pathology, Freshwater fish, Pikes, Analysis, Sampling, Data collections, Laboratory tests, Transfer, Water pollution, Aquatic environment.
Identifiers: Methylmercury, Methylation, Whitefish, *Sweden.

Several studies investigating the transport of mercury in food chains and methylation of mercury are reported. Mercury in the feathers of seed-eating birds was measured to find a correlation between those concentrations and mercury content in dressed seed. The feathers contained high amounts until such seed treatment was discontinued in 1965. Since then significant drops in mercury concentration have been reported. A fair correlation between mercury levels in the feathers of fish-eating birds and mercury in fish was observed. A complex study analyzed mercury levels in Northern pike, the contents of their stomachs (usually whitefish) and the contents of the stomachs of those fish (bottom fauna) from contaminated and uncontaminated waters. It was found that a certain amount of mercury results from the diet of the organism and additional mercury is incorporated directly from the water. Another investigation indicated that a certain microorganism present in the surface slime of Northern pike during the late winter and early spring has a high mercury methylation rate. DISTRIBUTION OF MERCURY IN RESIDUAL SOILS,
Colorado School of Mines, Golden. Dept. of Chemistry.
P. B. Trost, and R. E. Bisque.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 178-196, 1972, 6 fig, 9 tab, 14 ref.

Descriptors: *Mercury, *Soil contamination, Soil horizons, Laboratory tests, Pollutants, *Distribution, Soil chemistry, Humic acids, Soil analysis, Sampling, Path of pollutants, Soil properties, Humus, Clays, Measurement, On-site data collections, Evaluation, Solubility, Vapors, *Oregon, *Path of pollutants.
Identifiers: *Residual soils.

A method for the differentiation of vaporous soil mercury and non-vaporous soil mercury by comparison of the mercury content in the organic-rich and clay-rich soil horizons was applied to samples from southwest Oregon. Field samples were analyzed for their mercury and humic acid (i.e., both the humic and fulvic fractions) content and the relative clay distribution was determined. Certain variables affect the distribution of the mercuric ion, Hg (++), and of mercury vapor in residual soils. It appears that humic acid solutions are capable of increasing the solubility of certain mercury compounds. The solubility of cinnabar in organic-rich soil horizons may far surpass its solubility in organic-poor soil horizons. Soil mercury distributions are controlled primarily by humus matter. No correlation was observed between the mercury and clay contents in these soil horizons. Humic-acid-type soil organics also control the distribution of vaporous mercury in soils to a far greater extent than clay. Laboratory studies and field studies are outlined and experimental results are presented. (See also W74-06770) (Jerome-Vanderbilt)

RESEARCH NEEDS: STUDY OF THE ENVIRONMENTAL DYNAMICS OF MERCURY,
Michigan Univ., Ann Arbor. Dept. of Environmental and Industrial Health.
R. Hartung.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 197-198, 1972.

Descriptors: *Research priorities, *Mercury, *Environmental effects, *Food chains, *Path of pollutants, Pollutants, Transfer, Chemical properties, Physical properties, Toxicity, Chemical reactions, Analysis, Evaluation, Water pollution, Human pathology, Organic compounds, Inorganic compounds.
Identifiers: *Mercury pollution, Methylation, Organomercuric compounds.

A brief outline is presented of some of the important studies that are necessary for a clearer understanding of the behavior and effects of environmental mercury. Different mercury compounds must be studied to determine their physical and chemical properties. Air and water transport mechanisms, along with storage and interconversions in sediments and soils need to be investigated in order to understand the complex multiple transport systems in the environment. The methylation processes are of major importance in understanding the toxicological impact of environmental mercury. The behavior of methylmercury and its movement through the food chain must be understood in order to determine the effects of mercury contamination in the environment upon man. ENVIRONMENTAL DYNAMICS OF MERCURY: DISCUSSION PAPER,
Rochester Univ. N. Y.
T. W. Clarkson, A. J. Coble, F. M. D'ltri, J. C. Gage, and L. Goldwater.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 198-201, 1972, 3 ref.

Descriptors: *Mercury, *Ion transport, *Reviews, *Vitamin B, Pollution, Heavy metals, Water pollution, Transfer, Chemical reactions, Aquatic environment, Toxicity, Stability, Solubility, Ions, Inorganic compounds, Organic compounds, Evaluation, Sediments.
Identifiers: *Methylation, Environmental dynamics.

The process of methylation of mercury is examined. Recent studies indicate there may be both nonenzymatic methylation of mercury by methylated vitamin B-12 from bacterial extracts and enzymatic methylation involving the addition of mercuric ions to the sulfhydryl group of cysteine or homocysteine. The sediments would most frequently contain a high proportion of the total mercury in an aquatic system. There are some cases in which the water would contain a high percentage of the total mercury, but rarely, if ever, is it found mainly in the biomass. The methylating process is inhibited by sulfides which join with mercury to form mercuric sulfide. The overall rate of methylation of mercury in the environment is low, requiring the presence of free Hg (++) ion. So far, it has not been possible to differentiate clearly between inorganic and organic mercury in natural aquatic environments. Because some of the present theories of environmental dynamics are based on small samples, more data are needed to form a statistically sound model for mercury transport phenomena. MERCURY CONCENTRATIONS IN HUMAN TISSUES AMONG HEAVY FISH EATERS,
New York State Dept. of Health, Albany.
R. F. Korns.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 329-331, 1972. 2 tab.

Descriptors: *Mercury, *Fish, *Diets, *Toxicity, *Public health, Pollutants, Organic compounds, Inorganic compounds, Analytical techniques, Food chains, Measurements, Evaluation, Poisons, Biochemistry, Great Lakes, Water pollution, Spectrophotometry, Fishing.
Identifiers: *Hair, Atomic absorption, Methylation, Spectrophotometry.

Hair from individuals who were known to fish in Great Lakes water was analyzed for mercury by cold vapor atomic absorption. For most of these individuals, the fish represented a substantial and frequent part of their diet. Most of these subjects were Negroes and Puerto Ricans. A total of 22 heavy fish eaters and 7 comparable control subjects were studied. One person was found to have 11.6 ppm mercury in her hair and had eaten fish seven days a week and occasionally twice a day. The average level of mercury in the hair of fish eaters was 3.7 ppm. The average mercury concentration in the hair of the control group was 0.9 ppm. (See also W74-06770) (Jerome-Vanderbilt)

EPIDEMIOLOGICAL APPROACHES TO THE STUDY OF SUBCLINICAL EFFECTS OF MERCURY INTOXICATION,
Michigan Univ., Ann Arbor. School of Public Health.
I. T. T. Higgins.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 331-341, 1972. 1 fig, 3 tab, 4 ref.

Descriptors: *Mercury, *Toxicity, *Surveys, *Human population, *Epidemiology, Pollutants, Poisons, Analytical techniques, Testing procedures, Methodology, Sampling, Population, Ecology, Human pathology, Diseases, Pathology.
Identifiers: *Subclinical effects.

In an epidemiological approach to the investigation of subclinical mercury intoxication the main emphasis is placed on the selection of a population for study and comparison of that population to other groups. Subclinical effects are those which are not obvious but can be detected by careful examination. Most of these symptoms are nonspecific and can not be used for indices of mercury contamination unless rigorous criteria are satisfied. The main criteria are: discrimination, reproducibility, validity, simplicity and acceptability. Each of these criteria is considered in detail. Dose-response relationships must be studied by plotting an estimate of dosage against the proportions of subjects showing the subclinical effect or clinical effects. Occupational groups exposed to mercury and communities living in areas with high levels of environmental mercury are suitable populations for investigations of mercury intoxication. The variation of effects on a given population should be examined and long term implications should be followed and assessed. Any control measures to be instituted on the basis of subclinical investigations should be carefully weighed against ecological considerations. (See also W74-06770) (Jerome-Vanderbilt)

THE EXREM III COMPUTER CODE FOR ESTIMATING EXTERNAL RADIATION DOSES TO POPULATIONS FROM ENVIRONMENTAL RELEASES,
Oak Ridge National Lab., Tenn. Radiation Shielding Information Center.
D. K. Trubey, and S. V. Kaye.
Available from NTIS, Springfield, Va., as ORNL-TM-4322; $5.45 in paper copy, $1.45 in microfiche. Report No ORNL-TM-4322, Dec 1973. 85 p, 10 ref, 2 append.

Descriptors: *Radioactivity, Environment, Effluents, Measurement, *Water pollution sources, *Air pollution, *Soil contamination, *Computer programs, Population, Public health, Estimating, Forecasting.
Identifiers: Dose, *Dose rate(Radiation), Dose equivalent rate, Total dose equivalent.

EXREM III is a computer code to estimate the dose equivalent rate and the total dose equivalent from beta, positron, electron, and gamma radiation resulting from submersion in contaminated water, submersion in contaminated air, and exposure to a contaminated surface. There can be more than one environmental release, and exposure can begin at any time after the first release. EXREM III considers contributions from environmental releases and from nuclide decay chains. For a particular problem the user may choose to calculate either dose rates, or the total doses, or both for any of the three modes of exposure. A separate solution array is printed for each mode of exposure. EXREM III is a revised version of EXREM II which was available earlier. The principal revisions include treatment of positron and electron radiations, selection of nuclear data from a data base, variable dimensioning of large data arrays, and free field input. The code is available from the Radiation Shielding Information Center. (Houser-ORNL)

GEOLOGIC AND HYDROLOGIC BACKGROUND FOR SELECTING SITE OF PILOT-PLANT REPOSITORY FOR RADIOACTIVE WASTE,
Geological Survey, Denver, Colo.
H. Barnes.
Bulletin of the Association of Engineering Geologists, Vol 11, No 1, p 83-92, 1974. 1 fig, 8 ref.

Descriptors: *Survey, Sodium compounds, Sodium chloride, Mining, *Sites, *Rock mechanics, Hydrology, Mine drainage, *Radioactive waste disposal, Geology, Safety, Assessment, Evaluation, Kansas, *New Mexico, Colorado, Utah, Arizona, Louisiana, Gulf Coastal Plains, Waste treatment, Liquids.

The U.S Geological Survey recently completed a series of studies designed to help the Advanced Research Projects Agency and the U.S. Atomic Energy Commission evaluate selected rock types and areas in the United States as potential sites for underground emplacement of noxious or radioactive wastes. The rock types selected were salt and impermeable argillaceous rocks. The areas investigated include the Permian salt basin (especially that part in southeastern New Mexico), the Paradox basin in Utah and Colorado, the Supai salt basin and Luke salt body in Arizona, and the northern Gulf Coast salt-dome province. Of these rock types and areas, the bedded salt deposits of southeastern New Mexico and the Paradox basin seem to be the most promising sites for underground emplacement of noxious or radioactive wastes. FINAL ENVIRONMENTAL STATEMENT RELATED TO THE PROPOSED ALVIN W. VOGTLE NUCLEAR PLANT UNITS 1, 2, 3, AND 4.
Directorate of Licensing (AEC), Washington, D. C.
Available from the National Technical Information Service, Springfield, Va., as Docket No. 50424-59; $10.60 per copy, $1.45 microfiche. Report No. Docket 50424-59, 50425-56, 50426-56, and 50427-56, March 1974. 383 p, 46 fig, 44 tab, 138 ref, 12 append.

Descriptors: *Nuclear powerplants, *Effluents, Environment, Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, *Georgia.
Identifiers: *Environmental impact statements, *Pressurized water reactors, *Savannah River(Ga).

This final environmental statement was prepared in compliance with the National Environmental Policy Act. The proposed Alvin W. Vogtle Nuclear Plant would be located on the Georgia side of the Savannah River near the AEC Savannah River Plant. Each of the four units will employ a pressurized water reactor cooled by a closed-cycle cooling system of natural-draft cooling towers using water from the Savannah River. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. The conclusion was to issue a construction permit for the facility subject to the following conditions: (1) Monitoring for chlorine as specified; (2) water temperatures controlled within limits specified; (3) follow requirements of discharge water relative to minimizing adverse effects to Beaverdam Creek; (4) follow established procedures during construction and operation to minimize any irreversible damage to the environment. (Houser-ORNL)

A CRITICAL REVIEW OF SOLID RADIOACTIVE WASTE PRACTICES AT NUCLEAR POWER PLANTS,
Oak Ridge National Lab., Tenn.
A. H. Kibbey, and H. W. Godbee.
Available from the National Technical Information Service, Springfield, Va., as ORNL-4924; $5.45 per copy, $1.45 microfiche. Report No. ORNL-4924, March 1974. 70 p, 13 fig, 2 tab, 19 ref, 3 append.

Descriptors: *Nuclear powerplants, *Waste disposal, *Radioactivity, *Reviews, Waste storage, Waste treatment, Liquids, Waste disposal, Assay, Assessment, Census, Transportation, Underground waste disposal, Water pollution, Soil contamination, Water pollution sources.
Identifiers: *Waste burial.

The relationships between solid radioactive waste (radwaste) volume, curie content, and size and number of shipments were studied. These radwaste variables were normalized on the basis of thermal megawatt-hours. All operating light water reactors (LWRs), starting with Dresden Unit 1, were considered from first criticality through December 31, 1972. Plant operating reports and docket materials, supplemented with earlier similar open literature summaries, were the main sources of information. In addition, selected plants known to be planning or undergoing revisions in solid radioactive waste handling procedures were contacted directly. Waste core components were excluded from the analysis because this study was concerned mainly with the trends of routine solid radwaste generated from operation of the liquid waste treatment system. The routine wastes considered in this study are filters, filter sludges, spent demineralizer resins, evaporator concentrates, and dry compressible wastes which are shipped for offsite burial. In the overall analysis, these are grouped together and referred to as total solid radwaste shipped. (Houser-ORNL)

ENVIRONMENTAL SCIENCES DIVISION ANNUAL PROGRESS REPORT FOR PERIOD ENDING SEPTEMBER 30, 1973,
Oak Ridge National Lab., Tenn.
S. I. Auerbach, D. J. Nelson, and E. G. Struxness.
Available from the National Technical Information Service, Springfield, Va., as ORNL-4935; $7.60 per copy, $1.45 microfiche. Report No. ORNL-4935, March 1974. 173 p, 62 fig, 38 tab, 111 ref.

Descriptors: *Environment, *Ecology, *Ecosystems, *Computer programs, *Model studies, Toxicity, Soil contamination effects, Water pollution effects, Absorption, Sorption, Adsorption, Strontium, Plutonium, Food chain, Public health.

Progress is reported in development of computer codes, and model studies concerned with environmental hazards. Waste management studies included mathematical models to follow the movement of water and radionuclides in terrestrial environments. Assessment of environmental impacts of reactor stations is continuing. Behavior patterns, survival, growth, reproduction, and population responses of fish are of major concern. In aquatic ecosystem studies, investigations were carried out in radionuclides cycling, radiation effects, and toxicant formation in condenser cooling systems. Terrestrial radionuclide cycling and effects, toxic materials in the environment, plutonium in mesic and humid environments, and a study of terrestrial and aquatic system interaction are discussed. (Houser-ORNL)

BUFFER CAPACITY IN AQUATIC ECOSYSTEMS,
Georgia Inst. of Tech., Atlanta. Environmental Resources Center.
F. G. Pohland, and W. R. Bolton.
Available from the National Technical Information Service as PB-231 469, $3.75 in paper copy, $1.45 in microfiche. Report ERC-0474, March 1974, 43 p, 10 fig, 3 tab, 11 ref, append. OWRR A-033-GA(1). 14-31-0001-3510.

Descriptors: *Hydrogen ion concentration, *Acid-base equilibrium, Water chemistry, Acid streams, *Organic wastes, Organic loading, *Anaerobic conditions, Ecosystems, Ecology, Model studies, Water pollution sources, Water pollution control, *Chemical reactions, Forecasting.
Identifiers: *Buffer capacity, Biological stabilization.

Stream water quality and ecological balance can be substantially affected by pH changes. The change in the pH that one would otherwise expect to be induced by the influx of acidic or alkaline wastes can be significantly reduced by the buffering action of indigenous biochemical reactions. Accurate prediction of the magnitude of induced pH change thus requires information on the strength of the natural buffer system and on its resistance to the effects of various wastes. Analysis of system pH response and buffer capacity was approached through an example of anaerobic biological stabilization of waste organic materials. Simulation of the recognized sequential conversion of complex organic materials through acid production and methane fermentation permitted identification of some of the primary processes and provided a basis for the development of an acid-base equilibrium model reflective of buffer capacity during either normal or distressed conditions. The model can be used to predict the effects of organic wastes on natural aquatic ecosystems and therby provides potentially important input to control the operation of conventional waste treatment processes. Algorithms were developed from the model for iterative solution for pH, buffer capacity, or the adjustment necessary to obtain a desired pH or buffer capacity. The model requires input description of the modeled anaerobic ecosystems that can be determined by explicit or suggestive analysis. The models, computer programs, and example solutions are presented. MODELING AND OPTIMIZATION OF TRANSIENT COOLING WATER DISCHARGE FROM POWER GENERATING PLANTS,
Kansas State Univ., Manhattan. Dept. of Industrial Engineering.
C. L. Hwang, and L. T. Fan.
Available from the National Technical Information Service as PB-231 354, $3.25 in paper copy, $1.45 in microfiche. Kansas Water Resources Research Institute, Manhattan, Contribution No. 130, December 1973. 33 p, 9 fig, 18 ref. OWRR B-030-KAN(6). 14-31-0001-3592.

Descriptors: *Water quality control, *Optimization, *Thermal pollution, *Regional analysis, *Management, Model studies, Control, *Kansas, Cooling water, Dispersion, Aeration, Waste water treatment, Powerplants.
Identifiers: Thermal pollution control, Water quality models, Optimal control, Regional water quality management.

The present research has yielded a series of publications. They contain the results of: (1) Compilation of water quality data and parameters, and hydrology of Kansas streams and rivers. The compilation could serve as a convenient source of information and should be useful for constructing mathematical models that are relevant to the water quality control and water resource management. (2) The effect of thermal discharge on stream water quality. A modified transient version of the Streeter-Phelps model and of Dobbin's dispersion model along with the energy balance equation is employed to analyze the effects of waste heat discharge from power plants on stream water quality. (3) Water quality control by artificial aera-

tion of stream receiving thermal and organic waste discharges. The location and number of diffuser type aerators to be installed along the stream are determined so as to maintain the stream DO content above a certain minimum requirement. A procedure is also presented for determining the optimal artificial aeration control policy to maintain the water quality. (4) A basin-wide management of water quality of a river which receives thermal and organic wastes. At-source treatment of these pollutants is carried out to control the water quality. (5) Optimal control of cooling water discharge from a power plant. The optimal policy permits a power plant to operate at the highest possible capacity and at the same time to maintain the highest possible water quality.

MATHEMATICAL MODEL FOR BARGED OCEAN DISPOSAL OF WASTES,
Tetra Tech, Inc., Pasadena, California.
C. Y. Koh, and Y. C. Chang.
Copy Available from GPO Sup Doc as EP1.23:660/2-73-029, $4.85; microfiche from NTIS as PB-232 018, $1.45. Environmental Protection Agency, Technology Series Report EPA-660/2-73-029, December 1973. 583 p, 29 fig, 14 tab, 68 ref, 2 append. EPA Project 16070FBY.

Descriptors: *Mathematical models, *Waste disposal, Sewage sludge, Liquid wastes, Barges, *Waste dilution, *Dispersion, Computer programs, Model studies, *Settling velocity, Great Lakes.
Identifiers: *Dredge spoils, Ocean dumping, *Ocean disposal.

Theoretical and experimental studies were performed on the dispersion and settling of barge disposed wastes in the ocean. A computer program based on the mathematical model has also been written. Comparison of predictions with experiments, both in this study and from previous investigations were found to be good. Example solutions based on the model for prototype situations are also presented. The waste is assumed to consist of two phases, (1) a solid phase characterized by constituents with various densities and fall velocities, and (2) a liquid phase. The methods of disposal considered include (1) discharge from a bottom a bottom opening hopper barge, (2) pumped discharge through a nozzle under a moving barge, and (3) discharge into the barge wake. The effects of ambient horizontal currents, density stratification, variation of diffusion coefficients are incorporated in the model. Three phases of dispersion are envisioned: (1) a convective phase, (2) a collapse phase, and (3) a long term diffusion phase. Transition between phases is accomplished automatically in the numerical model. In addition, the collapse phase may (a) be replaced by, or (b) include a bottom spreading phase. Under certain circumstances, the collapse phase is bypassed. Every attempt has been made to minimize the amount of input required in the use of the numerical model. Th integration steps and grid sizes are all automatically chosen by the model. Both detailed printout and graphic output are incorporated. The solution may also be terminated at the end of any of the three phases of dispersion. (See also W72-01987) (EPA)
W74-06837

THE RUNOFF OF WATER AND NUTRIENTS FROM WATERSHEDS TRIBUTARY TO CAYUGA LAKE, NEW YORK,
Cornell Univ., Ithaca, N.Y. Water Resources and Marine Sciences Center.
G. E. Likens.
Available from the National Technical Information Service as PB-231 477, $4.50 in paper copy, $1.45 in microfiche. Technical Report 81, February 1974. 124 p, 47 fig, 34 tab, 20 ref. OWRR A-029-NY(2).

Descriptors: *Lakes, *Watersheds(Basins), *Runoff, *Nutrients, Water chemistry, *New York, Measurement, Water quality, Streams, Sampling, Water analysis, Precipitation, Outlets, Freshwater, Hydrologic data, Statistical methods, Ecosystems, Trophic level, Regression analysis.
Identifiers: *Cayuga Lake(New York).

In June 1970, a detailed study was initiated to measure the water and nutrient inputs for Cayuga and Seneca Lakes via streams and precipitation. Data from the Cayuga Lake watershed are reported herein. The Finger Lakes play a major role in recreation and water supply as well as affect the general economy of the region in a variety of ways. The Cayuga Lake drainage area is described, including geologic, land use, and climatic considerations. Methods and procedures are discussed. Watershed boundaries for each tributary were identified and marked on a map of the Cayuga Lake Basin composited from U.S.G.S. topographic sheets. Streamflow was continuously gauged in only 4 of the major tributaries in the adjacent watershed to Cayuga Lake. Stream velocity was measured with a Gurley Pigmy Current Meter. Regression analysis was made between the continuously gauged streams and the instantaneous measurements from the ungauged streams; generally, the regression with the highest correlation coefficient was used. Streamwater samples were collected either weekly or biweekly by hand or with a non-metallic water sampler. Chemical analyses were made with a Perkin-Elmer Model 403 atomic absorption spectrophotometer. Since continuous, proportional samples were not obtained of runoff, a linear regression analysis was made between discharge and measured nutrient concentration for the monitored tributaries and lake outlet. Study results are discussed in detail. It was found that streamwater chemistry varies considerably throughout the Cayuga Lake Basin. (Bell-Cornell)
W74-06848

WATER AND NUTRIENT BUDGETS FOR CAYUGA LAKE, NEW YORK,
Cornell Univ., Ithaca, N.Y. Water Resources and Marine Sciences Center.
G. E. Likens.
Available from the National Technical Information Service as PB-231 478 $4.00 in paper copy, $1.45 in microfiche. Technical Report 83, March 1974. 91 p, 10 fig, 45 tab, 61 ref, append. OWRR A-029-NY(3).

Descriptors: *Lakes, Ecosystems, *New York, *Nutrients, Hydrologic aspects, *Trophic level, Watersheds(Basins), Water quality, *Measurement, Precipitation, Streams, Runoff, Outlets, Discharge(Water), Freshwater, Hydrologic data, Statistical methods, Eutrophication, Oligotrophy, Water chemistry, Biological properties.
Identifiers: *Cayuga Lake(New York).

A study initiated in June 1970 to measure the nutrient inputs for Lake Cayuga via streams and precipitation is reported. Hydrologic components including runoff, outlet discharge and lake renewal time, and hydrologic budget are discussed and nutrient budgets are considered. Although light is important, the input and availability of nutrients undoubtedly determines the ultimate trophic status of a freshwater ecosystem. The in situ turnover rate and the flux (direction and rate) of nutrients across the ecosystem's boundaries are of diagnostic value in determining the trophic status of a lake. Quantification of such inputs and outputs for ecosystems may be used to construct budgets and observe balancing mechanisms. Biotic functions within the ecosystem's boundaries are tempered by and respond to these external fluxes. The effect of the natural condition or managed state of the watershed then, in regulating the quantity and quality of drainage outputs (aquatic ecosystem inputs), is vital to this relationship. The studies were undertaken on the Cayuga Lake watershed to measure the nutrient and water inputs and outputs by geologic and meteorologic vectors for the lake ecosystem. (Bell-Cornell)
W74-06849

STORMWATER RUNOFF QUALITY FOR URBAN AND SEMI-URBAN/RURAL WATERSHEDS,
Purdue Univ., Lafayette, Ind. Dept. of Environmental Engineering.
F. T. R. McElroy III, and J. M. Bell.
Available from the National Technical Information Service as PB-231 482 $5.00 in paper copy, $1.45 in microfiche. Purdue University Water Resources Research Center Technical Report No. 43, February 1974. 156 p, 28 fig, 52 tab, 30 ref. OWRR-C-3277(3713)(1).

Descriptors: *Urban runoff, *Storm runoff, *Water quality, *Urban drainage, Coliforms, Biochemical oxygen demand, Suspended solids, Sampling, Watersheds(Basins), Hydrographs, *Indiana, Land use.
Identifiers: Rural runoff, *Pollutographs, Fecal coliforms, *Urban watersheds, *Rural watersheds, *West Lafayette(Ind), Flushing.

Samples of stormwater runoff from an urban and a semi-urban/rural watershed were collected at established gaging-sampling stations. The pollutional characteristics of the runoff for the two watersheds were different. The peak BOD, suspended soils, total coliform and fecal coliform tended to be higher from the urban watershed, but there was considerable range in concentration. A 'first flush' of suspended solids and BOD was exhibited at the urban sampling station while this was not so evident at the semi-urban/rural station. Mass emission pollutographs of BOD and suspended solids showed that the concentration and flow both affected the shape of the pollutograph. The flow hydrograph had a very dramatic effect on the shape and magnitude of the pollutograph. Comparing the two watersheds as to unit 'pounds per day per acre-MGD', the stormwater runoff from the semi-urban/rural watershed had suspended solid and BOD values ranging from .14 to 4.3 lb/day/acre-MGD and from .07 to .14 lb/day/acre-MGD, respectively. The urban watershed had BOD values ranging from 7 to 25 lb/day/acre-MGD and suspended solids ranging from 2 to 8 lb/day/acre-MGD. (Wiersma-Purdue)

ON THE SELECTION OF A GROUND DISPOSAL SITE BY SENSITIVITY ANALYSIS,
Kyoto Univ., (Japan). Dept. of Sanitary Engineering.
S. Morisawa, and Y. Inoue.
Health Physics, Vol 26, No 3, p 251-161, March 1974. 4 fig, 6 tab, 21 ref.

Descriptors: *Radioactive waste disposal, Soils, Groundwater, *Radioisotopes, *Migration, *Dispersion, Movement, Safety, Evaluation, Assessment, Sites, Analysis, Ecology, Path of pollutants, Food chains, Public health.
Identifiers: *Dose calculations, Sensitivity analysis.

Disposal of radioactive wastes in the ground is not allowed in Japan at present mainly because of the difficulties in estimating the ground migration of radionuclides and in evaluating the internal dose caused by these wastes. Based on certain assumptions the migration pattern was set down in a previous paper, and the internal dose was estimated. In this paper, the desirable conditions for the ground disposal of radioactive wastes and the approximate method for estimating the internal dose are discussed by means of a sensitivity analysis. Eighteen out of some 26 factors in the three ecological paths through which leaked radionuclides migrate (i.e., drinking water, sea foods and plants) are quantitatively examined by sensitivity analysis. The relationships between the internal dose and the many factors concerned are shown in the tables. The difference between strict calculation and approximation of internal dose is also examined. The approximation is shown to be useful especially for the quick estimation of the safety of a site for the ground disposal of radioactive wastes. (Houser-ORNL)

241-T-106 TANK LEAK INVESTIGATION.
Atlantic Richfield Hanford Co., Richland, Wash.
Available from NTIS, Springfield, Va., as ARH-2874; $4.00 per copy, $1.45 microfiche. Report ARH-2874, Nov 1973. 48 p, 8 fig, 1 tab, 11 ref, append.

Descriptors: *Nuclear wastes, *Water pollution sources, Waste disposal, Water pollution, *Storage tanks, Leakage, Underground storage, *Washington, Seepage, Groundwater movement, Permeability, Soil contamination, Soils, Water table, Assessment, Safety, Evaluation, Public health.
Identifiers: Waste storage, *Hanford site(Wash).

On June 8, 1973, the 241-T-106 underground liquid waste storage tank, located on the U.S. Atomic Energy Commission's Hanford reservation, was confirmed as leaking. It was predicted that the leaked waste would be retained by the dry sediment well above the water table. A study was instigated to confirm this prediction. Results show the deepest penetration was 27 meters below the ground surface or 35 meters above the water table (approximately 87 and 116 feet, respectively). Based on these results and the basic knowledge of liquid movement in Hanford sediments, further movement of the radioactivity from its present location will be negligible. (Houser-ORNL)

BEHAVIOR OF RADIOIODINE IN THE ENVIRONMENT AND IN MAN,
Comitato Nazionale per l'Energia Nucleare, Ispra (Italy). Division Protezione Sanitaria e Controlli.
F. Breuer, and M. DeBortoli.
Available from NTIS, Springfield, Va., as RT/PROT(73)13; $6.25 per copy, $1.45 microfiche. Report CNEN-RT/PROT(73)13, 1973. 80 p, 3 fig, 21 tab, 129 ref.

Descriptors: Iodine, *Iodine radioisotopes, *Environment, *Radioisotopes, Behavior, Ecology, Fallout, Air pollution, Water pollution, Soil contamination, Absorption, Food chains, Human population, Public health, Degradation(Decomposition), Data collections, Aquatic plants, Marine algae.
Identifiers: *Decay, *Half-life.

A collection of data and information is presented for those who have the task of evaluating the consequences of radioiodine releases to the atmosphere. Data and comments are provided: on the physico-chemical state of radioiodine, also in connection with the different sources (fallout and nuclear plants); on the methods for its removal from air; on the mechanisms and parameters of interest in the deposition from air onto vegetation (dry and wet deposition) and the successive depletion; on the radioiodine transfer from grass to milk; on the metabolism in the adult and in the child, from a dynamic point of view and in relation with the stable iodine intake. Finally, the most practically useful data for radiation protection purposes are derived, for chronic as well as for acute contamination situations; for the latter the administration of stable iodine to reduce the dose is also considered. NITRIC OXIDE SORPTION BY CALCAREOUS SOILS: II. EFFECT OF MOISTURE ON CAPACITY, RATE, AND SORPTION PRODUCTS,
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
S. Miyamoto, R. J. Prather, and H. L. Bohn.
Soil Science Society of America Proceedings, Vol 38, No 1, p 71-74, January-February 1974. 6 fig, 3 tab, 8 ref.

Descriptors: *Sorption, *Nitrogen, *Waste disposal, Path of pollutants, Air pollutants, Calcareous soils, Soil disposal fields.
Identifiers: *Nitric oxide, *Land disposal(Wastes).

At room temperature, the nitric oxide (NO) sorption capacity of calcareous soils increased with the presence of moisture in an air + NO stream (1.5% NO by volume) and in the soils. The largest increase, up to 10-fold or approximately to the acid-titratable basicity of soils, occurred when NO and H2O were sorbed simultaneously by initially dry soils from a moist air (humidity > 95%) + NO stream. The sorption rates were proportional to the unused portion of the capacity with the rate constants ranging from 0.02 to 0.03 per min for NO and 0.01 to 0.015 per min for H2O under simultaneous sorption. Initially moist soils sorbed NO from a dry air (humidity < 5%) + NO stream until the soils dried. The rate of NO sorption slowed at initial soil water suctions less than approximately 1 bar. Sorbed NO was recovered as nitrate and reacted with the basicity in moist soils. Less than 20% of the sorbed nitrogen was lost upon heating at 105 deg C for 24 hours. (Knapp-USGS)
W74-06894

KINETICS OF THE PHOSPHATE INTERACTION WITH CALCITE,
Utah State Univ., Logan. Dept. of Soil Science and Biometeorology.
R. A. Griffin, and J. J. Jurinak.
Soil Science Society of America Proceedings, Vol 38, No 1, p 75-79, January-February 1974. 6 fig, 1 tab, 19 ref.

Descriptors: *Phosphates, *Calcite, *Sorption, *Adsorption, Thermodynamics, Solubility, Kinetics, Free energy, Soil chemistry, Mineralogy, Water chemistry.

Phosphate interaction with calcite did not proceed in the absence of the calcite surface. The kinetics of interaction could be described by two simultaneous reactions. The first reaction was second-order and was ascribed to the adsorption of phosphate on the calcite surface. The second reaction was first-order and was associated with the surface arrangement of phosphate clusters into calcium phosphate heteronuclei. Solubility criteria show that at low phosphate concentrations the ultimate calcium phosphate surface mineral formed was hydroxylapatite. Desorption kinetics were studied by using an anion exchange resin technique. The desorption process could be described as two simultaneous first-order reactions. The desorption mechanism corresponds to the dissolution of a surface nucleated calcium phosphate mineral, with the second reaction step being the desorption of phosphate from the calcite surface sites. The rate constants for adsorption and desorption were determined at four temperatures between 0 deg C and 40 deg C and were used to compute the activation energies of adsorption and desorption. In addition, the enthalpy of activation, the entropy of activation, and the free energy of activation for both the adsorption and desorption processes were computed. (Knapp-USGS)
W74-06895

AZIDE AND ETHYLENETHIOUREA MOBILITY IN SOILS,
Agricultural Research Service, Beltsville, Md. Agricultural Environmental Quality Inst.
C. S. Helling, and S. M. Thompson.
Soil Science Society of America Proceedings, Vol 38, No 1, p 80-85, January-February 1974. 2 tab, 27 ref.

Descriptors: *Translocation, *Pesticide kinetics, *Leaching, *Path of pollutants, *Chromatography, Movement, Analytical techniques, Pesticide residues, Soil water movement, Sorption, Herbicides.

Movement of pesticides in soil was studied using a masking technique developed for visualizing nonradioactive compounds on soil thin-layer chromatographic plates. To determine azide mobility, leached plates were sprayed with a kaolinite slurry in 95% ethanol, air-dried, and resprayed with 2% Fe(N03)3 in 5% HN03. The average mobility of azide in four mineral soils was 0.87, and in a muck 0.21; it is thus quite mobile in most soils. The form of azide (NaN3, KN3, or KN3 + K2C03) did not affect mobility. 2-Imidazoli-dinethione (ethylenethiourea, or ETU), a degradation product of ethylenebis (dithiocarbamate) fungicides, was evaluated after masking with kaolinite + alumina (1:2), sprayed onto soil plates in 95% ethanol. Nitroprusside and Grote's reagents were useful chromogenic reagents. Mobility was also determined by autoradiography; average mobilities for four mineral soils ranged from 0.83 to 100, decreasing to 0.61 in a muck. Although weakly adsoebed from solution, ETU is immobilized by drying the soil before leaching. 2-Imadazolidone (ethyleneurea) and possibly sulfur were detected in soil incubated 7 days with ETU. (Knapp-USGS)
W74-06896

NITROGEN MINERALIZATION-WATER RELATIONS IN SOILS,
Agricultural Research Service, Beltsville, Md. Agricultural Environmental Quality Inst.
G. Stanford, and E. Epstein.
Soil Science Society of America Proceedings, Vol 38, No 1, p 103-106, January-February 1974. 3 fig, 1 tab, 8 ref.

Descriptors: *Nitrogen, *Soil chemistry, *Water chemistry, *Soil moisture, Moisture tension, Regression analysis, Porosity, Soil texture, Nitrification, Denitrification, Path of pollutants.
Identifiers: *Mineralization(Soil nitrogen).

The relationships between soil N mineralization, soil water content, and matric suction were studied in nine soils of widely differing chemical and physical properties. Highest N mineralization rates occurred between matric suctions of 1/3 to 0.1 bar, in which range 80% to 90% of the total pore space was filled with water. In the range from optimum soil water content (1/3 to 0.1 bar) to 15 bars, a near-linear relation generally existed between amounts of mineral N accumulated and soil water contents. With increasing dryness, N mineralization continued to decline. Water levels above optimum often reduced mineral N accumulations, presumably because of denitrification. Upon expressing the values for N mineralization (Y) and soil water content (X) for each soil on a relative basis with respect to maximum N mineralized (Y = 100) and associated optimum soil water content (X = 100), the regression of Y on X did not differ among soils. Regression coefficients for common (based on covariance) and total regressions, respectively, were 1.07 and 1.02. Corresponding Y-intercepts were -2 and -4. A reasonable approximation of the regression is Y = X. (Knapp-USGS)
W74-06897

MINERAL NITROGEN MOVEMENT INTO SUBSOILS FOLLOWING CONTINUED ANNUAL FERTILIZATION FOR CORN,
Minnesota Univ., St. Paul. Dept. of Soil Science.
J. M. MacGregor, G. R. Blake, and S. D. Evans.
Soil Science Society of America Proceedings, Vol 38, No 1, p 110-113, January-February 1974. 2 fig, 2 tab, 15 ref.

Descriptors: *Path of pollutants, *Fertilizers, *Nitrates, *Leaching, Nitrification, Dentrification, Ammonia, Nitrogen, Soil water movement, Percolation, Irrigation effects, Tile drainage.

Nitrogen movement was studied in two clay loam soils fertilized in planting for corn (Zea mays L.) for 10 or 15 growing seasons at annual rates of 0, 44.8, or 268.8 kg N/ha. After 10 growing seasons, little NO3-N remained below drainage tile depth in Le Sueur clay loam. After 11 growing seasons on untiled Forman clay loam, considerable NO3-N was found at depths to 6 or 7 meters. After 15 years, appreciable nitrate occurred to the 10-m depth. The average rates of movement of the NO3 front for the 10 and the 15-year periods were 1.7 and 1.9 mm/day, respectively. Concentrations of ammonium N were similar under all fertilizer treatments. Annual N additions failed to significantly increase corn grain yields on Le Sueur clay loam but significantly increased yields on Forman clay loam. (Knapp-USGS)

WANDO RIVER ENVIRONMENTAL QUALITY STUDIES, AN INTERIM REPORT.
South Carolina Water Resources Commission, Columbia.
April 1973. 115 p, 17 fig, 6 tab, 11 ref.

Descriptors: *Estuaries, *Water quality, *South Carolina, Environment, Data collections, Hydrologic data, Harbors.
Identifiers: *Wando River(S.C.).

The South Carolina Water Resources Commission designed and conducted an environmental quality study of a portion of the Wando River and an adjacent tract of highland during the period July 1972 through March 1973. The findings are suitable for environmental impact statements for port development in the vicinity of Hobcaw Creek. The Wando River is less turbid and contains less undesirable soluble and sedimentary materials than the other major tributaries of the Charleston Harbor estuary. The quality of water at the mouth of Wando River is significantly affected by flows originating in the Cooper River resulting in a degradation of aquatic conditions. There is a gradual and dramatic improvement of quality upstream in proportion to the distance from Charleston Harbor. Development along the lower reaches will probably not result in additional deterioration to water quality since such conditions already exist. Nor will such developments seriously affect upstream quality providing industrial effluents are nontoxic to marine forms and are otherwise adequately treated. (Knapp-USGS)
W74-06919

DISTRIBUTION OF METALS IN BALTIMORE HARBOR SEDIMENTS,
Environmental Protection Agency, Annapolis, Md. Annapolis Field Office.
O. Villa, Jr., and P. G. Johnson.
Middle Atlantic Region-III Technical Report 59, January 1974. 64 p, 20 fig, 20 tab, 31 ref.

Descriptors: *Heavy metals, *Chesapeake Bay, *Distribution patterns, *Path of pollutants, *Water pollution sources, Bottom sediments, Lead, Copper, Chromium, Cadmium, Zinc, Nickel, Manganese, Mercury, Spectrophotometry, Flame photometry, *Maryland.
Identifiers: *Baltimore Harbor.

In order to develop a current inventory of metals contamination of Baltimore Harbor, sediment samples were collected at 176 stations and analyzed for Pb, Cu, Cr, Cd, Zn, Ni, Mn and Hg using atomic absorption spectrophotometry. Concentration levels were compared with levels found in another highly industrialized harbor complex, other estuarine systems and in Chesapeake Bay sediments geographically removed from the Harbor. Distribution patterns of various metals were related to industrial and municipal inputs. Concentrations of all metals analyzed from the Harbor were about 3 to 50 times greater in value than their counterparts from the Chesapeake Bay. Distribution of metals generally reflected the inputs from the large industrial complex which Baltimore Harbor supports. In black colored sediments mercury, copper, lead and cadmium probably exist as sulfides. Particle size can play a significant role in adsorption reactions of metallic species. Baltimore Harbor and the Chesapeake Bay have generally similar sand, silt and clay ranges, with both averaging about 84% silt and clay. Differences in concentration between the systems were therefore not attributed to variations in particle size. (Knapp-USGS)

ANALYSIS OF IODINE IN ANTARCTIC SNOW,
Nevada Univ., Reno. Desert Research Inst.
M. S. Owens, and J. A. Warburton.
Antarctic Journal, Vol 8, No 6, p 343-344, November-December 1973. 2 fig, 2 ref.

Descriptors: *Iodine, *Precipitation(Atmospheric), *Antarctic, Chemical analysis, Sampling, Neutron activation analysis, Pollutant identification.

Snow collected in Antarctica at Byrd Station in 1969 and 1970, and at Byrd, Siple and Pole Stations in 1971 and 1972 at depths down to 6 meters was analyzed for iodine. Analysis is by ion exchange concentration, followed by neutron activation analysis. Polyethylene bags and containers are a source of iodine contamination of aqueous solutions. In a typical case, water with an initial concentration of less than 5 times 10 to the 13 power grams per milliliter increased to 30 times 10 to the -13 power grams per milliliter after storage in a 20 liter polyethylene bottle for 1 month. GROUND WATER POLLUTION FROM SUBSURFACE EXCAVATIONS: PART II--POLLUTION FROM WELLS.
Water Well Journal, Vol 28, No 4, p 55-56, 58-59. April 1974. 6 tab.

Descriptors: *Water pollution sources, *Water wells, *Waste disposal wells, Excavation, Water pollution control, Path of pollutants, Water quality.

Groundwater pollution often results from subsurface excavations--excavations of all types including water wells. Any time a hole is constructed which provides a possible avenue to bypass the surface filtering system, the chance for pollution is increased. Waste disposal wells are a relatively recent development and are becoming increasingly popular as restrictions on the discharge of noxious and obnoxious fluids to surface waters become more stringent. As of mid-1972 at least 246 such wells had been constructed in the United States. Some of the wastes that are being injected contain chemicals that are relatively toxic and will persist indefinitely in the subsurface environment. Monitoring of the subsurface environment is quite difficult in comparison with monitoring of the surface. If contamination of usable groundwater or other resources should occur, decontamination may be difficult or impossible. (See also W74-06277) (Knapp-USGS)
W74-06933

TRANSFORMATION OF IRON IN A WATERLOGGED SOIL AS INFLUENCED BY REDOX POTENTIAL AND PH,
Louisiana State Univ., Baton Rouge. Dept. of Agronomy.
S. Gotoh, and W. H. Patrick, Jr.
Soil Science Society of America Proceedings, Vol 38, No 1, p 66-71, January-February 1974. 5 fig, 1 tab, 32 ref.

Descriptors: *Iron, *Soil chemistry, *Water chemistry, Oxidation, Hydrogen ion concentration, Reduction(Chemical), Oxidation-reduction potential, Anaerobic conditions.

The distribution of different forms of iron in a waterlogged soil was studied over a wide range of closely controlled redox potential and pH conditions. Increases in water soluble and exchangeable iron were favored by a decrease in both redox potential and pH. The critical redox potentials for iron reduction and consequent dissolution was between +300 mV and +100 mV at pH 6 and 7, and -100 mV at pH 8, while at pH 5 appreciable reduction occurred at +300 mV. The distribution between water soluble and exchangeable iron fractions was highly pH dependent with a decrease in pH at a given redox potential increasing the relative amount of ferrous iron in the soil solution at the expense of that on the exchange complex. A thermodynamic approach to the equilibria

between solid phase ferric oxyhydroxide and a water soluble species of iron (Fe(+2) indicated that it was largely governed by the Fe(+2) - Fe(OH)3 system in which the ferric oxyhydroxide was a mixture of goethite and amorphous material. (Knapp-USGS)

SOLUTE MOVEMENT THROUGH DISTURBED AND UNDISTURBED SOIL CORES,
North Dakota State Univ., Fargo. Dept. of Soils.
D. K. Cassel, T. H. Krueger, F. W. Schroer, and E. B. Norum.
Soil Science Society of America Proceedings, Vol 38, No 1, p 36-40, January-February 1974. 9 fig, 19 ref.

Descriptors: *Solutes, *Translocation, *Soil water movement, *Unsaturated flow, *Path of pollutants, Nitrification, Dispersion, Leaching, Chlorides, Nitrates.
Identifiers: Miscible displacement.

Displacement of nitrate and Cl-36 were measured in disturbed (reconstituted horizon by horizon) and undisturbed soil profiles of Aberdeen loam and Beotia loam representing strong and moderate soil structure, respectively. Each soil core was 30 cm in diameter and at least 80 cm high. Mean water content of the undisturbed soil profile was greater and mean bulk density less than the corresponding values for the disturbed cores for each soil. For example, disturbance increased mean water content by 0.07 for Beotia loam with a 0.01 g/cc decrease in bulk density; disturbing Aberdeen decreased bulk density from 1.47 to 1.30 g/cc but increased mean water content only 0.03. The disturbed soils required greater throughput volume of distilled water to displace the solutes and had smaller dispersion coefficients than the undisturbed soils. For a given effluent sample, relative nitrate concentration was consistently greater than relative Cl-36 concentration due to nitrification occurring within both the disturbed and undisturbed soil profiles during the 24-week period. PROCEEDINGS NINTH BIENNIAL CONFERENCE ON GROUND WATER.
Water Resources Center University of California, Davis, Cal. 95616. Price $4.00. Conference held Sept 13-14, 1973, Francisco Torres Conference Center, Goleta, Calif: California University Water Resources Center Report No 26, December 1973. 154 p.

Descriptors: *Groundwater, *California, *Water resources development, *Water pollution control, Water law, Institutions, Governments, Federal water pollution control act, Regulation, Planning.

The theme of the 9th biennial groundwater conference (California) is a consideration of the growing awareness of factors affecting groundwater quality. Discussed are research findings that relate to quality of water contained in underground aquifers, of water dependent upon a conjunctive or interfacing use between surface water and groundwater aquifers, and related topics concerning activity on the overlying land encompass land-use planning and the consequences for groundwater quality. Operating processes, procedures and programs functioning to use, develop and manage groundwater resources are discussed. Agencies, organizations and individuals involved in the complex array of operating procedures followed in groundwater management present a range of viewpoints to strengthen the basic hypothesis of this conference: that optimal management of groundwater resources requires explicit concern for explicit operational procedures applying to groundwater quality. Institutional settings in which the operating procedures and processes take place with regard to management and use of groundwater resources are considered. Problems encountered by agencies, organizations and individuals charged with the management and decision-making responsibilities relative to groundwater use and development include needs for improved data and reconsideration of laws and operational procedures, better evaluation of total environmental impact, and more consideration of the economic and social consequences of development, use and management of water resource systems. GROUND WATER QUALITY MODELS: WHAT THEY CAN AND CANNOT DO,
Water Resources Engineers, Inc., Walnut Creek, Calif.
D. E. Evenson, G. T. Orlob, and T. C. Lyons.
In: Proceedings of 9th Biennial Conference on Ground Water, Sept 13-14, 1973, Francisco Torres Conference Center, Goleta, Calif: California University Water Resources Center Report No 26, p 38-45, December 1973. 10 ref.

Descriptors: *Water quality, *Groundwater, *Mathematical models, Reviews, Simulation analysis, Data collections, Model studies.
Identifiers: *Water quality models.

Groundwater quality models are reviewed. Although at present groundwater quality models have generally been designed to deal with conservative substances, principally the mineral salts, this need not be a real limitation. Soil scientists and agricultural engineers have studied the complex interactions not only between cations and anions in solution, but also between dissolved quality constituents and the soil, and the use of these constituents by crops. Given the quality of infiltrating water and the characteristics of the soil column a model can simulate the quality of water effluent from the soil profile where it enters either the saturated soil column, tile underdrains or an adjacent stream. The primary mechanisms that distribute quality constituents in the saturated portion of the groundwater basin are advection (flow) and dispersion (flow variation). The techniques for formulating realistic models are available and apparently are adequate. What may not be available or adequate is a body of data upon which to build practical quality models of actual systems. Groundwater quality models developed to date, like their counterparts--groundwater quantity models--have been basically two-dimensional, although some crude approximations have been made to account for transport along a third axis. Groundwater basin models have usually been two-dimensional in plan, while sea water intrusion models have been formulated as two-dimensional in profile. Technically, there are no real obstacles to development of a computer program for three-dimensional groundwater quality (or quantity) simulation. Reliable groundwater quality models are strongly dependent upon a capability to describe the movement of groundwater. Quantity and quality models are interactive. The development of groundwater quality models requires processing of data, usually in large amounts. Preliminary development and testing of quality models may provide the first indications of data weaknesses that can be remedied by future action. (See also W74-06942) (Knapp-USGS)

PROTECTING GROUND WATER QUALITY--SOME PROBLEMS AND SOLUTIONS,
Luhdorff (E.E.) Co., Woodland, Calif.
E. E. Luhdorff, Jr.
In: Proceedings of 9th Biennial Conference on Ground Water, Sept 13-14, 1973, Francisco Torres Conference Center, Goleta, Calif: California University Water Resources Center Report No 26, p 53-57, December 1973.

Descriptors: *Water wells, *Public health, *Water pollution control, *California, Regulation, Aquifer testing.

Some areas of well construction are not related to the problems of providing sanitary protection of the well at the surface, but rather to the protection of the groundwater quality of the lower aquifers. One of the major problems in well design and construction is knowing which aquifer should be used in the completion of the well. It is highly desirable to know the quality of water each aquifer contains and ideally its transmissibility, to predetermine how much water will be produced from the well and what its ultimate quality will be. In order to predetermine the conditions which will exist within a completed well, it is advantageous to test individual aquifers in the well before its completion. Regulations are being authored, adopted and administered in California on local levels by a growing number of counties and cities. (See also W74-06942) (Knapp-USGS)

EFFECTS OF SOLID WASTE DISPOSAL ON GROUND WATER QUALITY,
L. A. Burch.
In: Proceedings of 9th Biennial Conference on Ground Water, Sept 13-14, 1973, Francisco Torres Conference Center, Goleta, Calif: California University Water Resources Center Report No 26, p 78-84, December 1973.

Descriptors: *Landfills, *Water pollution sources, California, Garbage dumps, Leaching, Biochemical oxygen demand, Heavy metals, Groundwater, Bacteria.

Solid wastes may be the source of several types of water polluting substances. Leachate from refuse may have a BOD as high as 20,000 mg/liter and the COD may be equally as high. Leaching may cause an increase in mineral content of groundwater, as illustrated by major increases in TDS, hardness, chloride, and sulfate. The electrical conductivity may be as high as 25,000 micromhos with chloride concentrations commonly exceeding 2,000 mg/liter. Refuse may contain high densities of coliform, fecal coliform and fecal streptococci organisms and a landfill may provide an ideal habitat for survival and possible regrowth of these organisms; leaching may physically transport such microorganisms out of the landfill. Various organic and inorganic chemicals may be disposed of in a landfill and be present in a discharge from a

landfill. Solid wastes may adversely affect groundwater by two processes--the percolation of leachate and the migration of carbon dioxide gas from the buried solid wastes into the underlying groundwater. The geologic and hydrologic characteristics of a disposal site control the effects that these two processes may have on groundwater quality. Geologic factors include the type of materials underlying a site, their ability to retard the movement of leachate or carbon dioxide to the groundwater, or soil reactions with the percolating waste products. Pertinent hydrologic factors include the position of the groundwater and its proximity to the disposal site and the rate and direction of groundwater movement. (See also W74-06942) (Knapp-USGS)
W74-06949

SLUDGE DISPOSAL TO LAND,
California Univ., Riverside. Dept. of Soil Science and Agricultural Engineering.
P. F. Pratt.
In: Proceedings of 9th Biennial Conference on Ground Water, Sept 13-14, 1973, Francisco Torres Conference Center, Goleta, Calif: California University Water Resources Center Report No 26, p 85-93, December 1973. 2 tab, 6 ref.

Descriptors: *Water pollution sources, *Groundwater, *Sludge disposal, *Fertilizers, Nitrates, Heavy metals, Trace elements, Salts, Salinity.
Identifiers: Land disposal(Wastes).

The effects of land use of sludges on groundwater quality depend on the chemical constituents that remain or become soluble and the volume of drainage water that moves from the soil-root system and eventually becomes part of the groundwater. The main problems are nitrates and the soluble cations Ca, Mg, Na and the anions HCO3, SO4 and Cl. If sludges are added at rates adequate to provide the proper amounts of available nitrogen, the available phosphorus requirements of crops will usually be met if not exceeded. However, the reactions of phosphorus with soils and with mineral constituents (calcium, aluminum and iron ions or colloids) in the sludge itself will insure that the phosphorus moves downward very slowly. The only exception would be in sands, in which case the downward migration of phosphorus compounds might be of concern over a long period of time but would still be f at least an order of magnitude slower than the movement of nitrate or chloride. The development of undesirable levels of trace elements in soils as a result of using sludges as a source of nutrients is a slow process and depends on the particular sludge and its rate of use, the soil, and the crops grown. An example of the time involved is provided by the use of liquid digested sludge on agricultural lands in Hertfordshire, England. In this case, the West Hertfordshire Main Drainage Authority has set a tentative limit of no more than 30 years for the use of its sludge. (See also W74-06942) (Knapp-USGS)

AGRICULTURAL WASTES AND GROUND WATER QUALITY,
California Univ., Davis.
R. S. Ayers.
In: Proceedings of 9th Biennial Conference on Ground Water, Sept 13-14, 1973, Francisco Torres Conference Center, Goleta, Calif: California University Water Resources Center Report No 26, p 94-96, December 1973.

Descriptors: *Water pollution sources, *Farm wastes, Leaching, Fertilizers, Groundwater, Water pollution control, *California.

Irrigated agriculture's waste products include salts concentrated by evapotranspiration, residues of fertilizers and soil amendments not picked up by crops, and animal manures from dairy and feed lots. The contamination can be minimized by establishing a favorable balance where export of pollutants balances import, and at a sufficiently low level of pollutant that beneficial uses are not affected. ENVIRONMENTAL QUALITY: AS AN OBJECTIVE OF GROUND WATER MANAGEMENT,
California State Dept. of Water Resources, Sacramento.
M. H. Remy.
In: Proceedings of 9th Biennial Conference on Ground Water, Sept 13-14, 1973, Francisco Torres Conference Center, Goleta, Calif: California University Water Resources Center Report No 26, p 126-131, December 1973.

Descriptors: *Water pollution control, *Groundwater, *Federal water pollution control act, Monitoring, Regulation, Water quality act, Planning, California, Water law.

Groundwater managers in California can do several things to obtain and impart information needed for wise management of resources. This integration of environmental information into the planning process need not await governmental regulation of the resource. First, much of the basic data on well activities can be obtained from well logs required to be filed under the Water Code. Both diligent enforcement of this filing requirement and increased efforts to make the public aware of such filing requirements will increase the volume and quality of vital data. Secondly, groundwater agencies should make every effort to prepare meaningful and complete environmental impact reports for activities they intend to carry out which might significantly affect the environment. Since groundwater basins are characteristically subject to the assertion of private rights, water resources managers should also begin to use environmental impact reports as a means of communicating with the public. Wszechswiat. 3, p 61-62, 1972.
Identifiers: *Biology, Detergents, Industrial wastes, Pesticides, *Poland, Pollution, Rivers, Sewage, *Water pollution, Effluents.

So-called purified sewage drained into natural water bodies polluted the water. Various types of pollution such as industrial effluents, detergents, commercial fertilizers, pest conrol measures, and others are discussed, and also in some cases the negative influence of mechanical soil cultivation and improper regulation of rivers. Standards for defining the quality of natural water based on biological criteria and strict control of such standards should be established. About 42% of the river waters in Poland are polluted to the point of being unusable.--Copyright 1973, Biological Abstracts, Inc.

DYNAMICS OF CHANGES IN THE CONCENTRATION OF FLUORINE COMPOUNDS EMITTED BY THE PHOSPHORUS FERTILIZER MANUFACTURING ESTABLISHMENT IN POZAN, AND THEIR INFLUENCE ON SURFACE AND UNDERGROUND WATERS AND ON THE ATMOSPHERE WITHIN TH E LIMITS OF THE CITY OF POZNAN, (IN POLISH),
Medical Academy, Poznan (Poland).
A. Jankowiak, Z. Szulczewski, P. Fierek, O. Fiksinska, and L. Pawlak.
Biul Sluzby Sanit Epidemiol Wojewodztwa Katowickiego. Vol 16, No 1, p 95-99. 1972.
Identifiers: Cities, Disposal, Environmental, *Fertilizer manufacture, *Fluorine, *Phosphorus, *Poland(Poznan), Waste waters, *Potable water, Public health, Springs, Well water, *Air pollution.

The concentration of F in drinking water springs in the area studied was lower than optimal values. Well water showed a lower F content than water from municipal waterworks. The phosphorus fertilizer manufacturing establishment was a serious source of air pollution. Filtering installations were not sufficiently efficient in checking infiltration of F into the air. Systematic control of the F content in the air is needed to protect the people living in the vicinity of the factory.--Copyright 1973, Biological Abstracts, Inc.

NITROGEN-FIXING ACTIVITY IN UPLAND AND FLOODED RICE FIELDS,
T. Yoshida, and R. R. Ancajas.
Soil Sci Soc Am Proc. Vol 37, No 1, p 42-46. 1973. Illus.
Identifiers: *Acetylene reduction, Flooded crops, Methodology, *Nitrogen-fixing activity, Oryza-sativa, Paddy fields(Rice), Rhizosphere, *Rice fields.

The acetylene reduction and 15N methods showed that under field conditions of rice (Oryza sativa L.) culture N fixation ranging 3-63 kg/ha occurred in soil, water and the rice plant rhizosphere. The greatest fixation occurred in the rhizosphere and was more pronounced under flooded than under upland conditions. The N fixing activity in flooded soils increased after the panicle initiation stage of the rice plant. It was higher in the planted soil than in the unplanted soil.--Copyright 1973, Biological Abstracts, Inc.

DISTRIBUTION AND CIRCULATION OF ARSENIC THROUGH WATER, ORGANISMS AND SEDIMENTS OF LAKE MICHIGAN,
Michigan Univ., Ann Arbor. School of Natural Resources.
I. S. Seydel.
Arch Hydrobiol. Vol 71, No 1, p 17-30. 1972.
Identifiers: *Arsenic, Canada, Circulation, Distribution, *Lake Michigan, *Neutron activation analysis, Organisms, Plankton, Sediments, Water pollution sources, Lakes, Path of pollutants, *Lake Superior, Benthos.

The arsenic water, sediment, plankton and benthos samples from Lake Michigan and Lake Superior (USA, Canada) were measured by means of neutron activation analysis. The samples of Lake Superior served as comparison since Lake Superior is thought to be relatively unpolluted because of low industrialization on the shoreline as well as in the drainage area. Certain geological features of both the lakes suggest that in the natural state Lake Superior should have a higher As content than Lake Michigan. This investigation shows clearly that Lake Michigan has become enriched with As. The high As values of the sediments and the low As values of the water are due to the geochemical behavior of the As. Sources of As are listed.--Copyright 1973, Biological Abstracts, Inc.

5C. Effects Of Pollution

NITROGEN TURNOVER IN IMPOUNDMENTS,
Oklahoma State Univ., Stillwater. Dept. of Zoology.
D. W. Toetz.
Available from the National Technical Information Service as PB-231 199; $4.75 in paper copy, $1.45 in microfiche. Oklahoma Water Resources Research Institute Final Technical Completion Report (1973). 29 p, 5 fig, 8 tab, 8 ref. OWRR A-023-OKLA(2).

Descriptors: Aquatic plants, *Nutrients, Water pollution effects, Ammonia, Impoundments, Model studies, Midges, *Absorption, Rhizomes, Root systems, Isotopes, Leaves, Eutrophication.
Identifiers: *Michaelis-Menton model, *Potemogeton nodosus, *Ceratophyllum, *N-15 isotope.

The relationship between growth of aquatic plants and their nutrient supply is poorly understood. One object was to learn if the Michaelis-Menton model describes the relationship between the uptake of NH4 and the concentration of NH4 in solution. A hyperbola resulted when uptake of NH4 by Ceratophyllum (v) was plotted against the concentration of NH4 in solution (S). Linearity between v and S existed at concentrations less than 7 mg NH4-N(1)-1, suggested that a model for first order saturation kinetics might be appropriate. However, uptake was depressed by one-half at low temperatures and some of the uptake was apparently related to processes which are not completely passive. Another objective was to determine if hydrophytes could absorb ammonia through the root and rhizome system and, subsequently, translocate the absorbed nitrogen to stems and leaves. Uptake and translocation of 15N occurred in three species of hydrophytes. In the laboratory 90% of Potemogeton nodosus tested took up the isotope by roots and rhizomes and approximately 50% had the isotope in stem and leaf organs. Specific uptake rates for plants with enriched parts were highly variable: 0.02 to 40.08 micrograms NH4-N (mg N Root-Rhizome day) -1. Roots, rhizomes, stems and leaves of P. nodosus became enriched with 15N labeled ammonia which had been injected into the lake sediments.

MICRO-ECOSYSTEMS SIMULATION OF PRIMARY PRODUCTION IN THERMAL AND ACID MINE WATER LOADINGS RELATED TO WATER USE OF THE MONONGAHELA RIVER,
West Virginia Univ., Morgantown. Dept. of Biology.
Edward C. Keller, Jr.
Available from the National Technical Information Service as PB-231 234; $9.00 in paper copy, $1.45 in microfiche. West Virginia Water Research Institute, Morgantown, Completion Report, 1973. 442 p, 149 fig, 51 tab, 162 ref, 5 append. OWRR B-001-WVA(4). 14-31-0001-3351.

Descriptors: *Acid mine water, *Primary productivity, Ecosystems, Ecology, Phytoplankton, *Simulation analysis, *Thermal pollution, *West Virginia, *Chlorophyta, Mine water, Water pollution, Water quality, Aquatic microorganisms, Aquatic productivity, Plankton, Heat pollution, Pollution(Thermal), Acidity, Hydrogen ion concentration.
Identifiers: *Monongahela River(W Va), Micro-ecosystems.

Laboratory experiments indicated that the major controlling variables of primary growth and production were pH and total acidity. Buffering systems in the experiments significantly affected total productivity, but river water had very low buffering capacity. Significant modifications occurred in the estimated carrying capacities and general growth characteristics resulting from interactions of the acid mine water, thermal modification, and sewage inputs. Field experiments showed phytoplankter diversity to be significantly affected by acid mine water, there being extremely low diversity in the acid-mine-water feeder streams. Multiple regression analyses on biomass production in the river demonstrated that environmental and chemical variables examined at the Rivesville site were much more predictable than those at Fort Martin. The pH level accounted for 40 percent of the variation at Rivesville. Hardness, calcium, and magnesium were major predictors at Fort Martin, downriver. The total regression model predicted some 70 percent of the variation at Rivesville, only 58 percent at Fort Martin on differential growth analyses; and about 64 percent at Rivesville; and about 40 percent at Fort Martin on the original data.

OXIDATION OF ORGANIC MATTER IN SEDIMENTS,
Washington Univ., Seattle. Dept. of Oceanography.
M. M. Pamatmat, R. S. Jones, H. Sanborn, and A. Bhagwat.
Copy available from GPO Sup Doc as EP1.23:660/3-73-005, $1.30 microfiche from NTIS as PB-231 248 $1.45 . Environmental Protection Agency, Ecological Research Series, Report EPA-660/3-73-005, September 1973. 104 p, 24 fig, 12 tab, 48 ref. EPA Project 16070 EKZ.

Descriptors: *Anaerobic conditions, Benthos, Biodegradation, Biochemical oxygen demand, Bottom sediments, Humic acids, *Oxidation, *Oxygen demand, *Organic matter, Pacific Northwest U.S., *Water pollution effects, *Metabolism, *Washington, *Absorption.
Identifiers: Anaerobic metabolism, Dehydrogenase activity(Sediments), Oxygen debt, Metabolic heat release, Microcalorimetry, Lake Washington, Puget Sound, Sediment nutrient release.

Techniques were developed for sampling undisturbed sediment interface, and measuring oxygen uptake by intact sediment cores, dehydrogenase activity of sediment bacteria, and metabolic heat release by benthic organisms. Dehydrogenase activity, a relative measure of anaerobic metabolism, was calibrated by direct microcalorimetry to provide estimates of actual metabolism under field conditions. The oxygen debt of sediments was determined by a dichromate method. Laboratory experiments were conducted to determine the relationship between oxygen uptake, loss of carbon, and release of silicate, nitrate, ammonia, and phosphate by sediments. The oxygen consumption at 33 stations in Puget Sound was measured each season to provide baseline data for this estuary. The original working hypothesis, that total oxygen uptake represents a measure of total metabolism in the sediment column appears erroneous, at least in organically rich sediment where anaerobic metabolism may greatly exceed aerobic metabolism. As sedimentation rate of oxidizable organic matter increases, as in cases of organic pollution and eutrophication, anaerobic metabolism becomes an important process that is measurable by dehydrogenase assay. In less organic sediments, the rate of oxygen uptake may be a fair estimate of total metabolism. Furthermore, it is a useful index of equilibrium conditions among the various factors that affect the rate of oxygen uptake, e.g. oxygen tension, temperature, turbulence, available metabolizable energy, composition of community, etc. (EPA)

PHYTOPLANKTON POPULATIONS IN RELATION TO DIFFERENT TROPHIC LEVELS AT WINNIPESAUKEE LAKE, NEW HAMPSHIRE, U.S.A.,
New Hampshire Univ., Durham. Dept. of Botany.

H. W. Yeo, and A. C. Mathieson.
Available from the National Technical Information Service as PB-231 206 $12.25 in paper copy, $1.45 in microfiche. New Hampshire Water Resources Research Center Completion Research Report No. 9, February 1973. 155 p. 77 fig, 10 tab, 49 ref. OWRR A-019-NH(1).

Descriptors: *Phytoplankton, *Trophic level, New Hampshire, Phosphates, Nitrates, Silicates, Primary productivity, Distribution, Cyanophyta, Eutrophication, Nutrients, Water pollution effects, Indicators, Period of growth, Water temperature, Systematics, Nitrites, Chlorophyta, Diatoms, Chrysophyta, Euglenophyta.
Identifiers: *Winnipesaukee Lake(N.H.), Species diversity, Compound index, Dinophyta, Baccilariophyta, Cryptophyta, Xanthophyta.

The composition, abundance, and seasonal periodicity of phytoplankton at Lake Winnipesaukee, New Hampshire were determined. Eight stations were established to identify their phytoplankton floras and trophic levels. The Chlorophycean species usually dominated each monthly count. Aside from nutrients, the most influential factors affecting algal growth were light, temperature, and organic pollution. Nutrient enrichment experiments were conducted to evaluate their effect on primary productivity of natural phytoplankton populations. Phytoplankton was primarily comprised of Chlorophyceae, Cyanophyceae, Bacillariophyceae, and Chrysophyceae. Cynaophyceae usually dominated the phytoplankton in the number of cells although not in number of species. Different trophic levels appear to exist in the same lake. When applied to the entire lake, the collective indices designated a mesotrophic status to the lake with the Compound Index being the most useful in designating the trophic levels. The three lakes, Winnipesaukee, Newfound and Winnisquam have similar floras except that Winnipesaukee has a far greater number of species. Presence of 45 of the 60 algal genera most tolerant to organic pollution indicates the large impact of organic pollution in Winnipesaukee. Potentially troublesome taxa of algae. Aphanizomenon flos-aquae, Anabaena flos-aquae, Gloeotrichia echinulata, Polycystis aeruginosa, and Anabaena scheremetievi were found throughout the lake. (Jones-Wisconsin)

HYDROBIOLOGICAL STUDIES 3.
Ceskoslovenska Akademie Ved, Prague. Hydrobiologicka Lab.
Academia Publishing House, Prague, Czechoslovakia. 1973. 310p. 127 fig, 64 tab, 267 ref.

Descriptors: *Reservoirs, *Limnology, *Hydrobiology, Radioisotopes, Fertilization, Zooplankton, Carp, Primary productivity, Chemical properties, Physical properties, Mathematical studies, Drainage, Odor, Surveys, Water quality, Eutrophication, Potable water, Statistical methods, Marl, Indiana.
Identifiers: Lipno Reservoir(Czechoslovakia), Vltava Cascade(Czechoslovakia), Dyje River(Czechoslovakia), Klicava Reservoir(Czechoslovakia), Luzicka Nisa(Czechoslovakia), Marl lakes, Bohemia.

Czechoslovak reservoir limnology was studied including the amount of net zooplankton in stations at varying depths, primary production of phytoplankton, and some chemical and physical properties of water in shallow Lipno Reservoir. Temperature, transparency and concentration of some chemical constituents were also investigated in this reservoir. Primary production rates of two series of four interconnected calcareous lakes of northeastern Indiana were studied to ascertain factors controlling low productivity in marl lakes. Comparative experiments were carried out with nitrogen and phosphorus enrichment of small ponds with various breeding stages of carp fry. Effect of mineral fertilizers and fry on plankton development as well as on physics and chemistry of water, was followed in comparative experiments. Annual cycle and seasonal dynamics of zooplankton in backwaters of flooded River Dyje, South Moravia are described, biomass and its changes with regard to individual zooplankton associations determined, and results compared with those from other regions and water types. A survey was made of the water quality of 58 reservoirs in Czechoslovakia; 48 of these are located in the Elbe drainage area and 5 in Luzicka Nisa area. The major factors affecting odor in Klicava Reservoir was found to be anoxic conditions. (See W74-06531 thru W74-06533) (Jones-Wisconsin)
W74-06530

PRODUCTIVITY INVESTIGATIONS OF INTERCONNECTED MARL LAKES (I). THE EIGHT LAKES OF THE OLIVER AND WALTERS CHAINS, NORTHEASTERN INDIANA,
Michigan State Univ., Hickory Corners. W. K. Kellogg Biological Station.
R. G. Wetzel.
In: 'Hydrobiological Studies 3,' Academia Publishing House, Prague, Czechoslovakia, 1973, p 91-143. 19 fig, 7 tab, 41 ref.

Descriptors: *Productivity, *Marl, *Lakes, Indiana, Hardness(Water), Calcium, Cations, Physicochemical properties, Baseline studies, Hydrogen ion concentration, Carbonates, Trophic level, Photosynthesis, Bacteria, Organic matter, Light penetration, Oxygen, Systematics.
Identifiers: Oliver Chain Lakes(Indiana), Walters Chain Lakes(Indiana).

Approximately 15% of northern Indiana lakes are marl lakes, exhibiting high pH, alkalinity, and divalent cations. Causal relationships between low photosynthetic metabolism in marl lakes and regulatory mechanisms influencing primary productivity were investigated. The analysis involved two series of four interconnected marl lakes, each indicating some of the unique characteristics of the trophic ontogeny of marl lakes. Carbon-14 techniques were employed simultaneously from April 1963 through March 1964 to measure in situ rates of primary production. Major physical and chemical characteristics were determined concomitantly. Annual mean rates of primary production in the end basins, both receiving a majority of runoff and containing higher levels of organic matter, were double those of the central lakes. In progression from marl lakes of low production rates to those exhibiting increased productvity within an interconnected series, there exist factors characteristic of calcareous waters that suppress growth. Central among these interactions is the carbonate complex and resultant effects on organic matter and cycling utilization, and indirect complexing function of organic compounds. These effects are eventually counterbalanced, a result of several complex edaphic and morphometric factors, to permit increased sustained rates of production. (See also W74-06530) (Jones-Wisconsin)

UPTAKE OF NATURAL RADIOISOTOPES BY AQUATIC ORGANISMS,
Ceskoslovenska Akademie Ved, Prague. Hydrobiologicka Lab.
J. Justyn.
In: 'Hydrobiological Studies 3, 'Academia Publishing House, Prague, Czechoslovakia, 1973, p 145-171. 18 fig, 3 tab, 40 ref.

Descriptors: *Absorption, *Radioisotopes, *Aquatic populations, Indicators, Radium radioisotopes, Uranium radioisotopes, Potassium radioisotopes, Radioactive wastes, Algae, Plankton, Mosses, Aquatic plants, Mathematical studies, Daphnia, Crustaceans, Cyanophyta, Mollusks, Insects, Fish.
Identifiers: *Natural radioisotopes, Beta activity, Czechoslovak uranium mines.

Under natural conditions in an experimental cascade below the outfall from an abandoned uranium mine and in another 30 localities of surface waters and sources uptake of radium 226, uranium, gross beta activity and K-40 by aquatic organisms was studied. Also the uptake of radium 226 and gross beta activity was studied in aquatic organisms under laboratory conditions using five types of mine waters from Czechoslovak uranium mines. In general the aquatic organisms proved very good indicators of natural radioactive water contamination. Special attention was given to a plankton mixture of Daphnia and green monocellular algae. Mathematical relation between the natural radioactivity accumulated in various aquatic organisms and in water from their environment was drawn and the possibilities of using this relation as indication of natural radioactive contamination tested. Correlation of contents of Ra-226, uranium, gross beta activity and gross beta activity corrected to K-40, respectively, in ashes of filamentous algae, Bryophyta and other species and in the environmental water was found to represent an exponential function of the radioactive content of water. (See also W74-06530) (Jones-Wisconsin)
W74-06534

THE EFFECT OF MINERAL FERTILIZATION AND OF CARP FRY ON THE COMPOSITION AND DYNAMICS OF PLANKTON,
Vysoka Skola Zemedelska, Lednice (Czechoslovakia). Biological Station.
B. Losos, and J. Hetesa.
In: 'Hydrobiological Studies 3,' Academia Publishing House, Prague, Czechoslovakia, 1973, p 173-217. 16 fig, 4 tab, 51 ref.

Descriptors: *Ponds, *Fertilization, *Fish, *Plankton, *Primary productivity, Nitrogen, Phosphorus, Zooplankton, Daphnia, Copepods, Phytoplankton, Physical properties, Chemical properties, Dynamics, Cyanophyta, Diatoms, Chlorophyta, Rotifers, Crustaceans.
Identifiers: Carp fry.

Comparative experiments were carried out with nitrogen and phosphorus enrichment of small ponds with various stages of carp fry breeding. Effect of mineral fertilizers and fry on development of pond plankton and on physics and chemistry of water was investigated. Significant differences in plankton species composition were ascertained only between ponds with and without the fry, regardless of fertilization type. Various combinations and amounts of fertilizers had no substantial effects on plankton species composition. Only quantitative differences for some species were ascertained between ponds fertilized in different ways. In ponds without fry, water had no vegetation color and transparency was nearly to the bottom (100-150 cm). Species composition of phytoplankton was roughly the same in all ponds without fry. Zooplankton species composition was different in ponds with fry. Soon after stocking, a sudden depression of large cladocerans, Daphnia, was observed. After Daphnia had been consumed by the fry, small carnivorous copepods, Acanthocyclops vernalis, overcrowded. Rate of fry growth was significantly affected by the change of the zooplankton composition. When the fry consumes large Daphnia, its growth curve was steep; when feeding upon small copepods, fish growth slowed. (See also W74-06530) (Jones-Wisconsin)
W74-06535

ANNUAL CYCLE OF ZOOPLANKTON IN BACKWATERS OF THE FLOOD AREA OF THE DYJE,
Brno Univ., Musov (Czechoslovakia). Biological Station.
S. Osmera.
In: 'Hydrobiological Studies 3,' Academia Publishing House, Prague, Czechoslovakia, 1973, p 219-256. 19 fig, 5 tab, 48 ref.

Descriptors: *Cycles, *Zooplankton, *Backwater, *Flood plains, Seasonal, Copepods, Biomass, Crustaceans, Rotifers, Physicochemical properties, Dominant organisms, Annual, Aquatic plants.
Identifiers: *Dyje River (Czechoslovakia).

Zooplankton development is described in four types of backwaters with special regard to typical communities and their characteristic changes throughout the year. Biomass and its changes with regard to individual zooplankton associations were determined and results compared with those from other regions and water types. After an almost uniform amount of Copepoda in the winter, the total zooplankton is washed out during floods. A vernal increase of zooplankton occurs after disconnection of the backwaters. There is a second appearance of Copepoda, the majority of which are replaced later by Cladocera remaining until depression of the flora in the submerged vegetation. In open water areas, Cladocera are replaced by Rotatoria and pelagial species of Copepoda. From early summer, the number of zooplankton decreases. After an overturn until early winter, developmental stages, later even adult specimens of Copepoda, again appear; these persist all winter using the adequate oxygen supply. Nearly all zooplankton disappear in regions with oxygen deficits during the winter, only males of Copepoda and larvae of Chaoborus remaining. The conclusion drawn from a comparison of research is that Crustacea dominate reservoirs containing submersed vegetation while Rotatoria dominate where vegetation is lacking. (See also W74-06530) (Jones-Wisconsin)
W74-06536

SURVEY OF RESERVOIRS IN BOHEMIA AND THEIR WATER QUALITY,
Hydraulic Research Inst., Prague (Czechoslovakia).
V. Rozmajzlova-Rehackova.
In: 'Hydrobiological Studies 3,' Academia Publishing House, Prague, Czechoslovakia, 1973, p 257-282. 15 fig, 2 tab, 10 ref.

Descriptors: *Reservoirs, *Water quality, *Limnology, Water pollution effects, Surveys, Iron, Chemical oxygen demand, Dissolved oxygen, Drainage area, Hydrogen ion concentration, Hardness(Water), Phosphorus, Phytoplankton, Eutrophication, Forests, Plankton.
Identifiers: *Bohemia(Czechoslovakia), Elbe River(Bohemia), Luzicka Nisa(Bohemia).

Survey was made of water quality of 58 reservoirs in Czechoslovakia in 1965; 48 of these are located in the drainage area of the Elbe River and five in the Luzicka Nisa. Sixteen were water supply reservoirs while the remainder served for power production, the supply of industrial and irrigation waters, flood control, or pisciculture and recreation. Hydrogen ion concentration varied between 4.7 and 9.4, with most reservoirs around 7.0. The quantity of planktonic organisms in individual reservoirs varied widely. A typical water-bloom, formed by Aphanizomenon, Anabaena, and Microcystis was found during a single collection of samples only in three reservoirs. No close relationship existed between forested drainage areas and the quantity of phytoplankton in the reservoirs. When the forested percentage of the drainage area was high, total phosphorus in water decreased, but there was a small concentration of phosphorus even when the forested percentage was low. Only reservoirs whose drainage area displayed a low forested percentage showed a high degree of water hardness, while a low degree of hardness was found in reservoirs whose drainage area had a low of high forested percentage. The most polluted reservoir received pulp-mill wastes. (See also W74-06530) (Jones-Wisconsin)
W74-06537

CONTRIBUTION TO THE INVESTIGATION OF ODOURS IN WATER,
Hydraulic Research Inst., Prague (Czechoslovakia).
P. Popovska.
In: 'Hydrobiological Studies 3,' Academia Publishing House, Prague, Czechoslovakia, 1973, p 283-310. 18 fig, 6 tab, 24 ref.

Descriptors: *Odor, *Reservoirs, Dissolved oxygen, Hydrogen ion concentration, Depth, Decomposing organic matter, Statistical methods, Sediments.
Identifiers: Klicava Reservoir(Czechoslovakia).

The odor nuisance was studied in the Czechoslovak Klicava reservoir. Water samples were taken in regular 3-week intervals from January 1965 to August 1966, and odor strength of the water determined in each sample. By statistical methods it was proved that autotrophs (mainly diatoms) are not the primary constituents affecting its organoleptic properties. Using statistical methods it was shown that there is no relation between the quantities of fungi, the manganese bacterium Leptothrix echinata, and the water odor. The relationship between odor strength and pH, odor strength and water depth and odor strength and dissolved oxygen content were proved. No direct proportionality between water temperature and odor strength was found. By multiple linear regression and partial correlation the dependency of the odor on the concentration of dissolved oxygen, to a lesser degree on the water depth (biological processes in the bottom sediments) were found. The effect of pH on odor strength is, according to the results of multiple linear regression and partial correlation, negligible. (See also W74-06530) (Jones-Wisconsin)
W74-06538

SOURCES OF OXYGEN IN ESTUARIES,
M. Owens.
In: Proceedings of Symposium on Mathematical and Hydraulic Modelling of Estuarine Pollution, April 18-19, 1972, Water Pollution Research Laboratory, Stevenage, England, p 25-37. 1 tab, 28 ref.

Descriptors: *Oxygen, *Estuaries, *Advection, Nitrification, Atmosphere, Photosynthesis, Oxygenation, Measurement, Mathematical studies, Flow, Tidal effects, Reaeration, Velocity, Depth, Winds, Wavelengths.
Identifiers: *Oxygen sources, Exchange coefficient.

Sources of oxygen in estuaries are discussed and quantified. During specific periods of investigation, total gain in oxygen in the Thames Estuary from advective sources was about 170 tons/d which was about 18% of that required for complete oxidation of effluents discharged to the estuary. Under certain conditions nitrate and sulphate in the water are reduced by bacterial action and oxygen is directly utilized in oxidizing carbonaceous material, significant in some estuaries. Magnitude of oxygen contribution from the atmosphere is illustrated by considering that for an exchange coefficient of 1 cm/h, 0.24 g oxygen/sq m/d are absorbed for each mg/l deficit. Equations relating to photosynthetic oxygen production and respiration of the algae can be utilized to predict diurnal variations in DO concentration in the water. At certain times of the year freshwater flow, tidal exchange, and reaeration will be the most important sources. Magnitude of the oxygen contribution from the atmosphere is determined amongst other factors) by value of exchange coefficient. Further evaluation, particularly at velocities and depths found in estuaries, is required. Influences of wind speed and wave height on magnitudes of the exchange coefficient need precise defining. (Jones-Wisconsin)
W74-06539

UTILIZATION OF OXYGEN IN ESTUARIES,
Water Pollution Research Lab., Stevenage (England).
M. J. Barrett.
In: Proceedings of Symposium on Mathematical and Hydraulic Modelling of Estuarine Pollution, April 18-19, 1972, Water Pollution Research Laboratory, Stevenage, England, p 39-48. 4 fig, 1 tab, 27 ref.

Descriptors: *Dissolved oxygen, *Estuaries, *Mathematical models, Oxidation, Denitrification, Nitrification, Biochemical oxygen demand, Kinetics.
Identifiers: Thames River(England).

To predict dissolved oxygen distribution in an estuary, the whole course of oxidation up to the time when the remaining unoxidized material escapes through the seaward boundary or is lost by deposition and subsequent dredging must be represented mathematically. Oxidation of carbonaceous and nitrogenous constituents must be distinguished. In the Thames, effluents normally remain within the estuarine system about a month. To utilize BOD test results some means of converting them to 'instantaneous' rates of demand throughout the retention period is necessary. The rate constant increases with increasing temperature. The apparent first odor kinetics commonly found in experiments on oxygen uptake of sewage and other effluents is due to the facts that both a variety of organisms and substrates of differing susceptibilities to degradation are involved, and to the fate of oxygen utilization by respiring bacteria being approximately proportional to the number of organisms present. The course of oxidation of a wide range of wastes could be adequately represented by use of two rate constants. In estuaries nitrogen compounds participate both in oxidation and reduction. Once nitrification begins it continues in water containing low DO concentrations. Nitrate reduction might start under suitable conditions before all traces of DO were absent. (Jones-Wisconsin)
W74-06540

CHANGES IN WATER CHEMISTRY ACCOMPANYING SUMMER FISH KILLS IN SHALLOW EUTROPHIC LAKES OF SOUTHWEST MANITOBA,
Fisheries Research Board of Canada, Winnipeg (Manitoba). Freshwater Inst.
J. Barica.
In: Proceedings of the Symposium on the Lakes of Western Canada, 1973, Edmonton, Ontario, p 228-242. 4 fig, 2 tab, 13 ref.

Descriptors: *Water chemistry, *Lakes, *Fishkill, *Eutrophication, Shallow water, Algae, Dissolved oxygen, Ammonia, Phosphates, Nitrogen, Carbon, Phosphorus, Chlorophyll, Carbon dioxide, Chemical properties, Cyanophyta, Fish farming, Nitrates, Rainbow trout.
Identifiers: *Southwest Manitoba, Aphanizomenon flos-aquae.

Four cases of fishkills following the collapse of heavy Aphanizomenon flos-aquae blooms in shallow eutrophic lakes located in the Erickson area of southwestern Manitoba are described. Emphasis is placed on various chemical parameters in lake water and their changes during the collapse of the bloom and the subsequent fish mortalities. The most dramatic changes in water chemistry take place during the several days prior to the actual fishkill, that is, during the peak of the bloom and during the fishkill itself. Concentration of dissolved oxygen and ammonia undergo the most radical changes. Dissolved oxygen reaches its maximum concentration of 200% saturation or higher right before the fishkill. Concentrations of dissolved oxygen of 20 to 24 mg/l in the surface layers of the lakes are quite common; during this period the Aphanizomenon biomass reaches its maximum. Then, within a few days, a rapid die-off of algae begins and the entire bloom collapses. The

following phase--the actual fishkill--is characterized by a rapid drop of dissolved oxygen from the lake surface down to its bottom, with a simultaneous release of ammonia into the whole profile, without a clear zonation pattern. (Jones-Wisconsin)
W74-06541

OXYGEN IN ESTUARIES: REQUIREMENTS FOR FISHERIES,
Water Pollution Research Lab., Stevenage (England).
J. S. Alabaster.
In: Proceedings of Symposium on Mathematical and Hydraulic Modelling of Estuarine Pollution, April 18-19, 1972, Water Pollution Research Laboratory, Stevenage, England, p 15-23. 1 fig, 3 tab, 23 ref.

Descriptors: *Oxygen, *Estuaries, *Fish populations, *Oxygen sag, Dissolved oxygen, Life cycles, Fecundity, Juvenile growth stage, Larval growth stage, Fish behavior.
Identifiers: River Trent(England).

Sensitivity to low DO concentrations differ between fish species, life stages, and life processes. The DO requirements for fisheries in estuaries must consider this and type of fishery, times and places fish occur, and impact of impairment of each part of the life cycle. Acutely lethal effects would probably be avoided by maintaining DO levels above 3 mg/l though for some species this limit could be lower and for many species lower concentrations could be tolerated for short periods. Sensitivity of salmonid embroyos is greatest at hatching time with high mortalities from sudden exposure to 2-3 mg/l for 6 d. The considerable respiratory and cardiovascular adaptive fish responses to DO changes are not necessarily indicative of impairment of ecologically important functions, and probably should not be used as basis for judgments on DO requirements. Neither reduction in DO to about 5 mg/l nor moderately wide diurnal fluctuations about this level have much effect on growth rate of salmonid alevins. DO reduction to less than 50% saturation can depress juvenile fish food consumption and growth rate. Food resources, swimming performance, behavior, avoidance are all considered. Data given must form basis of DO criteria for fisheries. (Jones-Wisconsin)

CO-OPERATION FOR WATER PROTECTION: EUTROPHICATION CONTROL,
Organization for Economic Co-Operation and Development, Paris (France). Directorate for the Environment.
G. Dorin.
OECD Observer, No 65, August 1973, p 36-39.

Descriptors: *Water pollution control, *Eutrophication, *Pollution abatement, Nutrients, Monitoring, Sewage effluents, Agriculture, Industries, International commissions, Phosphorus, Nitrogen.
Identifiers: OECD.

Methods of control and monitoring of eutrophication are evaluated. Special attention is given to those substances which act as nutrients, particularly those containing phosphorus or nitrogen, and are often produced by biodegradation of more complex materials. Rapid growth of eutrophication suggests that in the fairly near future a large proportion of surface waters may become affected, in which case the socioeconomic and ecological consequences would be extremely serious. In most cases, phosphorus is the most important element of eutrophication development and the simplest to control. The Organization for Economic Cooperation and Development countries concentrate their efforts on four key points of eutrophication control: detergents containing phosphorus, waste water treatment, pollution by agricultural fertilizers and livestock production, and methods of water monitoring. Over a period of twenty years, eutrophication and the phosphorus concentration in water have largely kept in step with the increased use of detergents containing phosphorus in OECD countries. A significant proportion of sewage treatment plants operate inefficiently. A program is needed to educate farmers to use the best fertilization methods. Technically and commercially the modern management of animal wastes calls for considerable effort. In 1972 international experts drew up a common water measurement system especially designed for eutrophication control. (Jones-Wisconsin)

ABSENCE OF OXYGEN-EVOLVING CAPACITY IN DARK-GROWN CHLORELLA: THE PHOTOACTIVATION OF OXYGEN-EVOLVING CENTERS,
Martin Marietta Labs., Baltimore, Md.
G. M. Cheniae, and I. F. Martin.
Photochemistry and Photobiology, Vol 17, No 6, p 441-459, 1973. 7 fig, 3 tab, 36 ref. AT(11-1)3316.

Descriptors: *Plant morphology, *Chlorella, *Photoactivation, *Photosynthetic oxygen, Cytological studies, Photosynthesis, Manganese, Respiration, Plant pigments, Algae.
Identifiers: *Dark grown, Hill activity.

Studies are described of a light-dependent activation of oxygen evolution of green algae cultured in darkness. Chlorella cells were cultured in darkness and examined for pigment composition, capacity to evolve oxygen and capacity to photooxidize artificial electron donors to Photosystem II and I. From evidence obtained, such cells lack oxygen-evolving centers and the Mn pool associated with such centers but possess fully active System II and I trapping centers. Brief illumination (2-3 min) of dark-grown cells resulted in incorporation of Mn into the oxygen-evolving centers and capacity to evolve oxygen. It is concluded from results of these kinetic studies that the photoactivation of oxygen centers in dark grown Chlorella also is a multi-quantum process involving at least two rate limiting steps and a photosensitive state of limited stability. Measurements of oxygen-yield oscillations indicated that throughout the photoactivation process each newly formed oxygen-yielding center was independent of its neighbors. Photoactivation of the Mn-containing oxygen-yielding catalyst is a fundamental process in all photosynthetic oxygen-evolving tissue. Extrapolation of results would indicate that in development of the photosynthetic apparatus formation of oxygen-yielding sites must be preceded by formation of System II quantum-trapping centers. (Jones-Wisconsin)

STUDIES ON THE PHYTOPLANKTON ECOLOGY OF THE TRONDHEIMSFJORD. I. THE CHEMICAL COMPOSITION OF PHYTOPLANKTON POPULATIONS,
Norges Tekniske Hoegskole, Trondheim. Biological Station.
A. Haug, S. Myklestad, and E. Sakshaug.
Experimental Marine Biology and Ecology, Vol 11, No 1, p 15-26, 1973. 1 fig, 3 tab, 15 ref.

Descriptors: *Physiological ecology, *Chemical properties, *Phytoplankton, Proteins, Lipids, Phosphorus, Nitrogen, Dinoflagellates, Diatoms, Cytological studies, Analytical techniques, Carbohydrates.
Identifiers: *Trondheimsfjord(Norway), Chaetoceros affinis, Skeletonema.

Using observations of Chaetoceros affinis as a basis, changes in chemical composition of natural phytoplankton populations, particularly the changes in the amounts of the different carbohydrate fractions were studied in the hope that these changes may provide valuable information about the ecology of the phytoplankton in Trondheimsfjord, Norway. Samples of phytoplankton populations were analyzed for carbohydrate, protein, lipid, and phosphorus. Lipid was less than 10% of the organic dry matter. The N/P ratio was remarkably constant, but the ratio protein/carbohydrate varied between wide limits. For samples consisting mainly of dinoflagellates, the protein/carbohydrate ratio was always low due to a large amount of insoluble polysaccharides. For diatoms the carbohydrates may be divided into three fractions. The amounts of acid-soluble glucan varied from 7.7 to 36.5% of organic dry matter and these changes are the main cause of the variation in the protein/carbohydrate ratio of diatom samples. For diatom samples this ratio is a valuable indicator of the physiological state of the population. The gas-chromatographic investigation of the monosaccharide composition of the soluble carbohydrates also reveals a significant difference between dinoflagellates and diatoms. (Jones-Wisconsin)

THE EFFECTS OF ECOLOGICAL CHANGES ON BUCKEYE LAKE, OHIO, WITH EMPHASIS ON LARGEMOUTH BASS AND AQUATIC VASCULAR PLANTS,
Bureau of Sport Fisheries and Wildlife, Washington, D.C.
J. B. Judd, and S. H. Taub.
Ohio Biological Survey, Biological Notes No 6, 1973. 6 fig, 17 tab, 61 ref, append.

Descriptors: *Ecology, *Reservoirs, *Aquatic plants, *Ohio, *Bass, Systematics, Limnology, Turbidity, Fish behavior, Sport fish, Fish diets, Fish populations, Growth rates, Fish reproduction, Fish parasites.
Identifiers: *Largemouth bass, *Buckeye Lake(Ohio).

Evaluation of the present condition of Buckeye Lake in Ohio involved an analysis of age and growth structure of the largemouth bass population, a qualitative and quantitative survey of the higher aquatic plants, collection of physical and chemical parameters, and determination of the parasitic infections of the largemouth bass. Since its construction in 1826, Buckeye Lake has undergone ecological changes resulting in changes in status of the largemouth bass; it supported fewer but larger bass in 1970 than in the past, however, with a faster growth rate. The bass are not noticeably affected in growth or reproduction by interspecific competition from other fishes; they support a typical parasitic fauna, Proteocephalus ambloplitis, which does not appear to be a limiting factor. The lake's reduced capacity to support the comparatively large number of largemouth bass present in the late 1800's and early 1900's is due to the decrease in extent and number of higher aquatic plant species and removal of stumps, logs, and debris. Since 1930, the lake has become more eutrophic according to limnological measurements. Decrease of aquatic vegetation, bottom clearing with consequent increased wave action, plankton propagation have increased turbidity. (Jones-Wisconsin)

ENDOGENOUS AND PHOTOPERIODIC DIURNAL RHYTHMS OF IN VIVO LIGHT ABSORPTION AND SCATTERING IN THE GREEN ALGA ULVA LACTUCA L.,
Johns Hopkins Univ., Baltimore, Md. McCollum-Pratt Inst.; and Johns Hopkins Univ., Baltimore Md. Dept. of Biology.
S. J. Britz, and H. H. Seliger.
Biological Bulletin, Vol 144, No 1, p 12-18, 1973. 2 fig, 11 ref.

Descriptors: *Plant physiology, *Biorthyms, *Light, Chlorophyta, Photoactivation, Absorption, Photosynthesis, Wavelengths, Algae, Maryland.
Identifiers: Light scattering, Patuxent River(Maryland).

It had been observed that in the in vivo visible light absorption spectra of Ulva lactuca, the absorbance varied considerably over time at all wavelengths in a seemingly rhythmic pattern. Free floating specimens of Ulva lactuca were collected along the shore near the mouth of the Patuxent River, Maryland and cultured in the laboratory. At all wavelengths relative optical density values varied rhythmically with periods of 24 hours. The presence of these rhythms of light absorption and scattering in artificial nutrient medium under constant photoperiod was demonstrated with in vivo spectroscopy. The absorbance during photophase at 682 nm, the chlorophyll-a in vivo absorption maximum, was typically two to three times that during scotophase. Prephased endogenous rhythms (in continued darkness) were observed for a time period equal to three photoperiods. The absorbance rhythm did not correlate with changes in extractable chlorophyll-a or -b concentration. No changes in linear dichroism were observed, indicating the rhythm of light absorption could not be explained on the basis of orientation of individual absorber molecules. In vivo light microscopy did not reveal differences in chloroplast orientation. (Jones-Wisconsin)
W74-06547

THE INFLUENCE OF ENVIRONMENTAL FACTORS ON THE DISTRIBUTION OF FRESHWATER ALGAE: AN EXPERIMENTAL STUDY. III. EFFECTS OF TEMPERATURE, VITAMIN REQUIREMENTS AND INORGANIC NITROGEN COMPOUNDS ON GROWTH,
Michigan State Univ., East Lansing. Dept. of Botany.
B. Moss.
Journal of Ecology, Vol 61, No 1, p 179-192, 1973. 6 fig, 3 tab, 48 ref.

Descriptors: *Algae, *Temperature, *Vitamins, *Growth rates, Nitrogen compounds, Inorganic compounds, Distribution, Phosphorus, Ammonia, Nitrates, Chlorophyta.
Identifiers: Eutrophic algae, Oligotrophic algae.

Algal growth was determined at several temperatures under otherwise standard conditions, since temperature optima for growth varies markedly with species, in order to investigate whether oligotrophic species in general might have intrinsically lower growth rates than eutrophic algae. Effect of vitamin availability and ability to use nitrate by the eutrophic and oligotrophic flora was studied. Experiments to determine growth rate were carried out in constant temperature water baths fitted with heaters and refrigeration units. Species tested were: oligotrophic group--Micrasterias americana, Pleurotaenium trabecula, Cosmarium, Gonatozygon monotaenium, Roya anglica, and Desmidium swartzii; eutrophic group--Pandorina morum, Cosmarium botrytis, Closterium acerosum, Volvox aureus, Eudorina californica, Haematococcus droebakensis, Mesotaenium kramstai, Scenedesmus quadricuada, and Pediastrum duplex. The maximum growth rates of oligotrophic species tended to be smaller than those of eutrophic species. Temperature optima for growth under the conditions used did not differ between the two groups. Possible adaptive advantages of low growth rates in infertile waters are discussed in relation to theoretical generalization on the maturity of ecosystems. Some members of both groups required vitamin B-12 for growth, and most species tested could use either nitrate or ammonium as a nitrogen source. (Jones-Wisconsin)

EPIPHYTIC MICROPHYTES IN A POND POLLUTED WITH BEET SUGAR FACTORY WASTES,
Polish Academy of Sciences, Krakow. Zaklad Biologii Wod.
W. Huk.
Acta Hydrobiologica, Vol 15, No 1, p 89-95, 1973. 1 fig, 1 tab, 8 ref.

Descriptors: *Periphyton, *Microorganisms, *Sewage lagoons, *Algae, Industrial wastes, Anaerobic conditions, Systematics, Cyanophyta, Euglenophyta, Chrysophyta, Chlorophyta, Protozoa, Biochemical oxygen demand, Self-purification, Organic matter, Sugar beets.
Identifiers: *Sugar factory wastes, Bacteriophyta, Epiphytes.

Observations of epiphyte development were conducted on a specially prepared synthetic medium in a pond filled with undiluted beet sugar factory wastes. The medium consisted of bunches of narrow cellophane strips 15 cm long and 1 mm wide hung at 30 cm depth in two points in the pond. The collected material showed 62 systemic units, including Bacteriophyta, Cyanophyta, Euglenophyta, Chrysophyta, Chlorophyta, and Protozoa, of which only 22 units had been previously recorded. During the first two months after the beet sugar factory wastes had been released into the pond, water in the pond was navy blue and smelled putrid and contained poorly developed periphyton covering only part of the strips. When the color changed, the periphyton composition was much more varied; then great decrease of BOD-5 and the absence of dissolved oxygen indicated the existence of very intensive reductive-oxygenating processes. During the course of six months, full mineralization of the wastes released into the pond took place, with various organism communities participating. Individual states of self-purification of the wastes were clearly reflected in the composition of the periphyton species as well as in their abundance. (Jones-Wisconsin)

PROTOZOANS IN PONDS FILLED WITH SUGAR FACTORY WASTES,
Polish Academy of Sciences, Krakow. Zaklad Biologii Wod.
E. Grabacka.
Acta Hydrobiologica, Vol 15, No 1, p 97-111, 1973. 2 fig, 3 tab, 11 ref.

Descriptors: *Protozoa, *Sewage lagoons, *Industrial wastes, Bottom sediments, Fish farming, Self-purification, Benthos, Systematics, Dissolved oxygen, Anaerobic conditions, Organic matter, Bacteria.
Identifiers: *Sugar factory wastes, Golysz Experimental Farms(Poland), Metazoa, Ciliata, Heliozoa, Rhizopoda, Metopidae, Oxytrichidae.

Purification of sugar factory wastes is difficult because great quantities of sewage with high organic matter are produced in a short period. Purification was attempted by utilizing the wastes in fish ponds, where they are gradually mineralized, enriching the water with new nutrient compounds. Succession of protozoans in bottom sediments during the self-purification process was studied and the changes effected in the bottom microfauna by introduction of different waste concentrations from the sugar production process investigated, specifically the Ciliata group, of which many species are fairly sensitive indices of the degree of water pollution and hence reflect the course of self-purification. Self-purification was distinctly reflected in the development of Ciliata on the bottom, successively manifested in three ecologically different Ciliata associations. Strong pollution at the beginning of the experiment resulted in unfavorable conditions for protozoans. Enrichment of the pond with new mineral constituents favorably influenced increase in number of Ciliata. Ciliata numbers in ponds filled with undiluted of weakly diluted wastes were many times higher than in normally utilized ponds. No influence of wastes on the bottom microfauna of protozoans in the second year was found. (Jones-Wisconsin)
W74-06552

MACROBENTHOS OF PONDS WITH SUGAR FACTORY WASTES,
Polish Academy of Science, Krakow. Zaklad Biologii Wod.
J. Zieba.
Acta Hydrobiologica, Vol 15, No 1, p 113-129, 1973. 5 fig, 1 tab, 25 ref.

Descriptors: *Benthic fauna, *Ponds, *Industrial wastes, *Sewage lagoons, Diptera, Larvae, Biochemical oxygen demand, Fish farming, Benthos, Phytoplankton, Fish food organisms, Anaerobic conditions, Carp, Eutrophication, Biomass, Oligochaetes.
Identifiers: *Sugar factory wastes, Chironomidae, Glyptotendipes polytomus, Ciliata, Golysz Experimental Farms(Poland).

In purification of sugar factory wastes in fish ponds, biological productivity gradually increases as expressed by intensive development of bottom fauna. Metabolism of the dominant species of this fauna was considered for understanding of their ecological dependencies and consequently to a more satisfactory utilization of the wastes treated in the ponds. Results of a preliminary two-year investigation of macrobenthos are presented. Seasonal fluctuations in numbers and biomass of the macrobenthos fauna were related to trophic conditions dependent on different concentrations of sugar factory wastes. In ponds with undiluted and greatly diluted wastes, development of benthic fauna--mainly of Chironomidae larvae--occurred in a specific pattern. With no waste dilution a new generation of the fauna was more than two months behind as compared with the pond with diluted wastes. Conclusions are that presence of large amounts of macrobenthos in the first vegetation period after the inflow of wastes can provide considerable food reserves for larger stocks of reared carp. Wastes should not be too concentrated; otherwise the development of macrobenthos is inhibited and fish stocking is possible only in the second half of the summer. (Jones-Wisconsin)

REPORT OF THE EXPERT GROUP ON DETERGENTS.
Organization for Economic Co-Operation and Development, Paris (France). Directorate for the Environment.
Report 89769, 1973. 40 p, 1 fig, 3 tab, 2 append.

Descriptors: *Detergents, *Eutrophication, *Legislation, *Phosphates, Social aspects, Formulation, Social impact, Hazards, Laundering, Sewage treatment, Costs, Sodium compounds, Heavy metals, Economics.
Identifiers: *OECD, Sodium triphosphate, Ethylenediaminetetraacetic acid, Polycarboxylic acids, Hydroxycarboxylic acids, Polymers, Soaps, Sodium carbonate, Sodium silicate, Sodium nitrilotriacetate, NTA, EDTA.

Steps already taken by various OECD countries to control detergents affecting eutrophication are reported. Information was collected on detergent consumption and its trends, both in composition and quantity. Potential consequences, including economic, of proposed substitutes and their constituents are assessed. Basic considerations are presented concerning present national policies regarding the formulation of detergents with special reference to phosphate builders and to possible substitute materials in connection with existing or proposed legislation (national, federal, regional) and of voluntary agreements regarding the constituents of detergents which may affect eutrophication. Requirements of detergent performance are discussed and qualifications of substitutes for detergent phosphates including NTA, EDTA, polycarboxylic acids (citrates), hydroxycarboxylic acids, polymers, soap and soap-phosphate combinations, and sodium carbonate and sodium silicates with their prerequisite requirements for compatibility with the current types of textiles.

Cost associated with alternative policies are given. Appropriate enforcement policies should be promulgated to particular regional conditions. Research is in progress on NTA removability in water and sewage treatment processes, the carrying of heavy metals as soluble complex ions through sewage treatment processes into surface and ground waters, and on health effects. (Jones-Wisconsin)

A STUDY OF HAZARDOUS WASTE MATERIALS, HAZARDOUS EFFECTS AND DISPOSAL METHODS. VOLUME I.
Booz-Allen Applied Research, Inc., Bethesda, Md.
Available from the National Technical Information Service as PB-221 465. National Environmental Research Center, Cincinnati, Ohio, Final Report EPA-670/2-73-14, July 1973. 389 p, 8 fig, 81 tab, 873 ref. 68-03-0032.

Descriptors: *Hazards, *Industrial wastes, *Waste disposal, Water pollution, Costs, Information retrieval, Bibliographies, Solid wastes, Industries, Mining, Waste treatment, Radioactive wastes, Toxicity, Waste dumps, Food processing industry, Textiles, Pulp and paper industry, Chemical wastes, Oil industry, Metals, Waste identification, Soil contamination, Air pollution, Environmental effects, Chemical warfare, Explosives, Thermal powerplants, Waste water treatment, Injection wells, Control, Tannery wastes.
Identifiers: *Hazardous materials, Waste streams.

Background information is presented by providing a list of hazardous materials which should be subject to special disposal techniques, documentation of harmful effects now known and provisions for mechanisms for revising these harmful effects, develop a rating system for delineating the degree of hazard, and provide an inventory of current disposal practices and evaluation of these practices. Hazardous waste materials are defined as materials or combination of materials which require special management techniques because of their acute or chronic effects on biological health and the environment. An extensive literature search was conducted which included both manual and computer screening of pertinent literature sources. The industrial groups are identified with detailed information on the composition of industrial waste streams. The more pressing problem of hazardous wastes occurs as a result of production and use processes. Compounds found hazardous are tabulated into a rating system. A survey and inventory of treatment and disposal methods are presented. Major findings and conclusions are grouped under definition of hazardous wastes and identification of hazardous effects, selection and rating of hazardous materials, quantification and distribution, waste treatment processes, and national disposal systems. Recommendations and a bibliography are included. (See also W74-06556 and W74-06557) (Jones-Wisconsin)
W74-06555

A STUDY OF HAZARDOUS WASTE MATERIALS, HAZARDOUS EFFECTS AND DISPOSAL METHODS. VOLUME II.
Booz-Allen Applied Research, Inc., Bethesda, Md.
Available from the National Technical Information Service as PB-221 466. National Environmental Research Center, Cincinnati, Ohio, Final Report EPA-670/2-73-15, July 1973. 525 p, 20 fig, 89 tab, 61 ref. 68-03-0032.

Descriptors: *Hazards, *Industrial wastes, *Waste disposal, Mining, Coals, Bituminous materials, Food processing industry, Pulp and paper industry, Chemical wastes, Plastics, Resins, Elastomers, Soaps, Detergents, Paints, Explosives, Fertilizers, Pesticides, Textiles, Synthetic rubber.
Identifiers: Metals, Drugs, Varnishes, Lacquers, Enamels, Perfumes, Cosmetics.

A compilation of wastes generated by the food processing industry, textile mill products, paper and allied products; chemicals and allied products (including industrial organic chemicals and industrial inorganic chemicals); plastic materials and synthetic resins, synthetic rubber, synthetic and other manmade fibers; drugs, soap, detergents, cleansers, perfumes, cosmetics and other toilet preparations; paints, varnishes, lacquers, enamels, and allied products; agricultural chemicals, including chemical fertilizers and pesticides; and commercial and military explosives including liquid and solid rocket propellants, is given. Industry description, production statistics, economic statistics, waste characteristics, waste disposal and waste treatment processes and practices are described, including disposal hazards. (See also W74-06555) (Auen-Wisconsin)
W74-06556

A STUDY OF HAZARDOUS WASTE MATERIALS, HAZARDOUS EFFECTS AND DISPOSAL METHODS. VOLUME III.
Booz-Allen Applied Research, Inc., Bethesda, Md.
Available from the National Technical Information Service as PB-221 467. National Environmental Research Center, Cincinnati, Ohio, Final Report EPA-670-2-73-16, July 1973. 444 p, 15 fig, 85 tab, 70 ref. 68-03-0032.

Descriptors: *Hazards, *Industrial wastes, *Waste disposal, Statistics, Oil industry, Radioactive wastes, Industries, Economics, Tannery wastes, Air pollution, Water pollution, Nuclear powerplants, Powerplants, Solid wastes, Thermal pollution.
Identifiers: Leather industry, Asbestos industry, Department of Defense, Fabricated metals industry, Hospitals, Medical services, Steel industry, Nonferrous metals industry, Metals finishing, Nuclear powered ships.

A compilation of hazardous wastes generated by the following industries is given: The petroleum and coal products industry; leather tanning and finishing; abrasives, asbestos and miscellaneous nonmetallic mineral products; blast furnaces, steel works, and rolling and finishing mills; primary smelting and refining of nonferrous metals; coating, engraving and allied services of fabricated metals; nuclear power production; hospitals; and conventional power utilities. Included are listings of hazardous materials, their rating and supporting data. Industry description, economic statistics, production processes, waste materials, waste disposal processes and practices for each industry, as well as hazardous effects of wastes and impact of wastes on water quality are presented. Usage of coal, petroleum, natural gas, uranium and geothermal power by utilities and associated environmental pollution are detailed. Disposal of radioactive wastes for Naval nuclear-powered ships and their support facilities and a summation of their environmental monitoring is given. A comprehensive listing of hazardous materials and compounds found hazardous by a rating system is included. (See also W74-06555) (Auen-Wisconsin)

MODELING THE EUTROPHICATION PROCESS.
Utah Water Research Lab., Logan.
Proceedings of a workshop, September 5-7, 1973, Logan, Utah, Water Research Laboratory, Utah State Univ. November 1973. 228 p, 118 fig, 34 tab, 313 ref.

Descriptors: *Mathematical studies, *Eutrophication, *Lakes, *Model studies, Algae, Phosphorus, Nutrients, Biota, Thermocline, Ecosystems, Biological communities, Carbon, nutrients, Carbon, Oxygen, Nitrogen, Plankton, Phytoplankton, Water management(Applied), Diversion, Forecasting, Dynamics, Minnesota, Ohio, Wisconsin, Washington, Cyanophyta, Sediments, Cost benefit analysis, Welfare(Economics), Water pollution control, Lake Erie.
Identifiers: *Lake restoration, Lake Sammamish(Wash.), Lake Washington(Wash.), Shagawa Lake(Minn.), Lake Wingra(Wis.), Twin Lakes Watershed(Ohio), Lake Mendota(Wis.), Lake George(N.Y.).

Papers presented at the workshop include the following subjects: (1) Long-term lake recovery related to available phosphorus. (2) Modeling algal growth dynamics in Shagawa Lake, Minnesota, with comments concerning projected restoration of the lake. (3) Simulation of urban runoff, nutrient loading, and biotic response of a shallow eutrophic lake. (4) Some aspects of phosphorus dynamics of the Twin Lakes Watershed. (5) The role of thermocline migration in regulating algal blooms. (6) Need for an ecosystem perspective in eutrophication modeling. (7) Multi-nutrient dynamic models of algal growth and species competition in eutrophic lakes. (8) Rates of carbon, oxygen, nitrogen, and phosphorus cycling through microbial populations in stratified lakes. (9) Capabilities and limitations of a nutrient-plankton model. (10) Phytoplankton population changes and nutrient fluctuations in a simple aquatic ecosystem model. (11) Aquatic modeling in the Eastern Deciduous Forest Biome, U.S.-International Biological Program. (12) A physical model for simulation of aquatic ecosystems. (13) Activity analysis and the management of resources: model for control of eutrophication. (14) Component description and analysis of environmental systems: Oxygen utilization in aquatic microcosms. (15) Predicting the effects of nutrient diversion on lake recovery. A synopsis of the workshop and discussions are included. (See W74-06561 thru W74-06576) (Auen-Wisconsin)

SYNOPSIS OF WORKSHOP ON MODELING OF THE EUTROPHICATION PROCESS.
California Univ., Berkeley. Sanitary Engineering Research Lab.
P. H. McGauhey.
In: Proceedings of a workshop on Modeling the Eutrophication Process, September 5-7, 1973, Utah, Water Research Laboratory, Utah State University, November 1973, p 1-4.

Descriptors: *Eutrophication, *Mathematical models, *Analytical techniques, Methodology, Design, Technology.
Identifiers: *Lake reclamation, State-of-the-art.

The workshop revealed that the present state-of-the-art is far too primitive to produce either the universal model or to evaluate correctly the input which should go into it. The inability to construct or to formulate a universal model leads to the next best approach: that is to make specific models which may be used to protect specific lakes; and then try to expand these models to universalize them. The question is raised as to why any individual model is not further used. Items stressed by several participants are that: vertical mixing is important; models should include the effects of sediments in supplying nutrients; relative recovery rate of a lake may be a key to where management should be given priority; it is conceptually feasible to link hydrologic and lake response in a simulation model, or to the relative physical system to the response of biota systems (not vice-versa); models which link land and water are needed; land use in many cases determines the nutrient input; temperature is a more important factor than realized; feedback of nutrients during growing seasc

is not included in models which complicates the problem of interpreting the relationship of early fast growing organisms followed by slower growing organisms. (See also W74-06560) (Auen-Wisconsin)

LONG-TERM LAKE RECOVERY RELATED TO AVAILABLE PHOSPHORUS,
Washington Univ., Seattle. Dept. of Civil Engineering.
E. B. Welch, C. A. Rock, and J. D. Krull.
In: Proceedings of a Workshop on Modeling the Eutrophication Process, September 5-7, 1973, Logan, Utah, Water Research Laboratory, Utah State University, November 1973, p 5-13. 7 fig, 15 ref. NSF O-B-36810X, EPA R-800512.

Descriptors: *Mathematical models, *Lakes, *Reclamation, *Phosphorus, Washington, Sediments, Water quality control, Phytoplankton, Biomass, Eutrophication, Iron, Hypolimnion, Anaerobic conditions.
Identifiers: *Lake recovery, Lake Washington(Wash.), Lake Sammamish(Wash.).

Lake Washington's recovery is compared with Lake Sammamish, leading to some new hypotheses about internal mechanisms affecting the diversion response-phosphorus income relationship. In five years after diversion of one-third of its phosphorus input, Lake Sammamish showed no significant response while Lake Washington responded promptly to phosphorus decrease. The probable explanation is that the phosphorus income change to Sammamish has occurred on the asymptote portion of a response curve that allows for much less lake response to a given increase in phosphorus income than observed in Lake Washington. The internal mechanism that probably controls the phosphorus content available is large concentrations of iron released from sediments into an anaerobic hypolimnion, which complexes and subsequently resediments phosphorus before it is available to phytoplankton. Strong control of water column concentrations of total phosphorus by large exchanges of phosphorus with sediments was supported by a gross model predicting phosphorus response to income change. If sediment release rate was held constant and sedimentation rate was allowed to vary with phosphorus concentration then only a slight reduction in concentration was predicted and which would have occurred rapidly. (See also W74-06560) (Jones-Wisconsin)

MODELING ALGAL GROWTH DYNAMICS IN SHAGAWA LAKE, MINNESOTA, WITH COMMENTS CONCERNING PROJECTED RESTORATION OF THE LAKE,
Pacific Northwest Environmental Research Lab., Corvallis, Oreg.
D. P. Larsen, H. T. Mercier, and K. W. Malueg.
In: Proceedings of a workshop on Modeling the Eutrophication Process, September 5-7, 1973, Logan, Utah, Water Research Laboratory, Utah State University, November 1973, p 15-31. 10 fig, 2 tab, 20 ref.

Descriptors: *Mathematical models, *Eutrophication, *Plant growth, *Dynamics, Lakes, Minnesota, Reclamation, Phosphorus, Water quality control, Cycling nutrients, Nitrogen, Solar radiation, Sediments.
Identifiers: *Shagawa Lake(Minn.), Lake restoration.

The dominant source of phosphorus in Shagawa Lake has been from wastewater discharge. A model is presented which describes algal dynamics within the lake and suggests that current models simulating lake recovery may be inappropriate for the Shagawa Lake system. The hydraulic, phosphorus, and nitrogen budgets are given. The model simulates the observed spring algal bloom and demonstrates sensitivity to the magnitude of a hypothesized loss coefficient in both timing and magnitude of the algal bloom. It does not simulate the large late summer bloom of algae observed in the lake unless sediment nutrient supply and nitrogen fixation are included. It simulates the general cycle of available nitrogen and available phosphorus concentration, however. If the algal demand for available nitrogen can be met and if the rate of growth is regulated by the rate of supply of available phosphorus, the model will simulate the low levels of both available nitrogen and available phosphorus observed during the summer months. The role of the sediments in providing critical nutrients to overlying waters has been demonstrated and it is likely that the sediments will extend the recovery of the lake beyond the projected time span. SIMULATION OF URBAN RUNOFF, NUTRIENT LOADING, AND BIOTIC RESPONSE OF A SHALLOW EUTROPHIC LAKE,
Wisconsin Univ., Madison. Inst. for Environmental Studies
D. D. Huff, J. F. Koonce, W. R. Ivarson, P. R. Weiler, and E. H. DeHmann.
In: Proceedings of a workshop on Modeling the Eutrophication Process, September 5-7, 1973, Logan, Utah, Water Research Laboratory, Utah State University, November 1973, p 33-35. 25 fig, 3 tab, 15 ref. NSF AG-199, 40-193-69.

Descriptors: *Model studies, *Urban runoff, *Nutrients, *Ecosystems, Biological properties, Shallow water, Eutrophication, Lakes, Watersheds(Basins), Runoff, Phosphorus, Nitrogen, Productivity, Biomass, Phytoplankton.
Identifiers: *Lake Wingra(Wis.).

Research and modeling results are synthesized to simulate the behavior of the linked terrestrial and aquatic components of the Lake Wingra, Wisconsin basin ecosystem. Runoff to the lake was simulated, groundwater flows estimated, records made of lake discharge and lake stage, lake evaporation, and nutrient sources simulated. This modeling effort entails the coupling of detailed mechanistic models of the hydrology of a lake's drainage basin, prediction of nutrient loading, and biotic response. Although the model is simplified for a shallow lake, system specific regressions were utilized in the simulations sparingly, and only where mechanistic models have yet to be developed. The model represents a significant synthesis of the understanding of ecosystem functioning. The use of models as hypotheses of ecosystem behavior, therefore yields a tool for studies of management alternatives for aquatic systems. As such a tool, a model helps fill the gap between scientific insight and emprical type analyses. Simulation models may nevertheless allow for more rigorous testing of empirical models or management recommendations. This modeling effort indicates the feasibility of using detailed simulation models of lakes and their drainage basins. (See also W74-06560) (Jones-Wisconsin)

Identifiers: *Twin Lakes(Ohio), Nutrient diversion, Lake restoration, Small watersheds.

The small experimental Twin Lakes Watershed in Ohio is currently undergoing nutrient diversion (septic tank drainage) and presents a sampling design which facilitates the compartmentalization of the terrestrial and aquatic portions of this ecosystem. The most important phosphorus source was surface inflows to the lakes. The study considered the effects of nutrient diversion on hydrologic, geochemical, and limnological features of the watershed and the lakes, and examined methods of phosphorus inactivation as a step to recliming the lakes. The theory of ecosystem development provides the holistic framework needed to understand the relationship between activities of the terrestrial portion of a watershed and the response of aquatic communities to changes in these activities. Water and phosphorus inflows and outflows of the two lakes were measured, along with many other geological and limnological aspects. The assumptions normally applied to predict the time of lake recovery seem unjustified for the Twin Lakes due to their shallow depth and small size. Because the calendar year for calculations may not represent an interval of limnological time, a new time interval is being explored--the limnological year--based on the duration of an ecological event which may greatly facilitate statistical and mathematical analyses. THE ROLE OF THERMOCLINE MIGRATION IN REGULATING ALGAL BLOOMS,
Wisconsin Univ., Madison. Water Chemistry Program; and Texas A and M Univ., College Station. Dept. of Civil Engineering.
R. E. Stauffer, and G. F. Lee.
In: Proceedings of a workshop on Modeling the Eutrophication Process, September 5-7, 1973, Logan, Utah, Water Research Laboratory, Utah State University, November 1973, p 73-82. 6 fig, 1 tab, 15 ref. EPA 16010-EHR, TG5P2-WP-184-04.

Descriptors: *Thermocline, *Cycling nutrients, *Spatial distribution, *Eutrophication, Wisconsin, Phosphorus, Cyanophyta, Water quality, Nitrogen, Chlorophyll, Thermal stratification, Temperature, Epilimnion, Mathematical models, Nutrients.
Identifiers: *Lake Mendota(Wis.).

It is hypothesized that surges of algae biomass are dependent on refluxing of nutrients by periodic depression of the thermocline by meteorologic inputs. Field investigations of possible significance of this mechanism as a factor in controlling blue-green algal blooms in Lake Mendota, Wisconsin are reported. Meteorologic data were provided by the U.S. Weather Bureau. Sampling was accomplished by vertical profiling and chlorophyll sampling every meter down past the thermocline. The model predicts transport of nitrogen and phosphorus based on measurements of initial and final stages of density partitioned water column. This is an example of a lake definitely not in a steady nutrient transport state during stratified periods; instead, it depends on a stochastic process for recycling its own nutrient pool to maintain high chlorophyll levels. This type of periodic nutrient enrichment may be important in temperate lakes where metalimnetic reservies of nitrogen and phosphorus accumulate during stratified periods and where the mechanism for recycling of nutrients must be considered in estimating intra-lake nutrient transfers and in analysis of interactions among morphometric characteristics of lakes and time sequence of nutrient additions from external sources as they relate to biological productivity. NEED FOR AN ECOSYSTEM PERSPECTIVE IN EUTROPHICATION MODELING,

Georgia Univ., Athens. Dept. of Zoology; and Georgia Univ., Athens. Inst. of Ecology.
B. C. Patten.

In: Proceedings of a workshop on Modeling the Eutrophication Process, September 5-7, 1973, Logan, Utah, Water Research Laboratory, Utah State University, November 1973, p 83-87. 1 fig, 9 ref.

Descriptors: *Mathematical studies, *Ecosystems, *Eutrophication, *Mathematical models, Control, Trophic level, Abatement, Dynamics, Watersheds(Basins).
Identifiers: *Lake restoration.

Modeling the eutrophication process seems mainly to be concerned with the primary production subsystem of lake ecosystems. The exogenous drives are basically nutrient loadings and photosynthetic energy inputs, and the internal processes include physiological parameters of algal nutrition, limnological parameters of water mass and entrained nutrient dynamics. The appropriate minimal conceptual unit for modeling eutrophication is the whole ecosystem as ecosystem components are all mutually dependent. Consequently, control points for attacking eutrophication exist everywhere in the ecosystem, not just in the nutrient and producer parameters. Theoretically, remote control may be more important in ecosystems than direct control. That is, parameters far removed from a state variable in the interconnection network may be more significant in controlling that state than other, more closely associated parameters. In applications, the reciprocal principle in combination with the knowledge that ecosystems are completely controllable can form the basis for broader avenues of attack on environmental problems. The distinct possibility exists that small (inexpensive), well chosen and correctly timed (both determined from sensitivity analysis or optimal control theory) manipulations of ecosystem parameters, remote from the nutrient-primary production subsystem, may be able to produce dramatic improvements in water quality for the amount of control effort expended. MULTI-NUTRIENT DYNAMIC MODELS OF ALGAL GROWTH AND SPECIES COMPETITION IN EUTROPHIC LAKES,

Notre Dame Univ., Ind. Dept. of Civil Engineering; Notre Dame Univ., Ind. Dept. of Chemical Engineering; Illinois Univ., Chicago. Dept. of Biological Sciences; and TenEch Environmental Consultants, South Bend, Ind.
V. J. Bierman, Jr., F. H. Verhoff, T. L. Poulson, and M. W. Tenney.

In: Proceedings of a workshop on Modeling the Eutrophication Process, September 5-7, 1973, Logan, Utah, Water Research Laboratory, Utah State University, November 1973, p 89-109. 10 fig, 88 ref. EPA R-801245.

Descriptors: *Plant growth, *Nutrients, *Mathematical models, *Limiting factors, Eutrophication, Absorption, Competition, Biological communities, Phosphorus, Nitrogen, Cycling nutrients, Nuisance algae.
Identifiers: *Lake restoration, *Algal growth, Cell synthesis.

Kinetic equations describing algal growth in eutrophic lakes' surface waters are considered. A two-step growth model, involving separate nutrient transport and cell synthesis mechanisms, was developed and applied to one- and two-species systems where phosphorus was the primary nutrient regulating growth and to a two-specie system where phosphorus and nitrogen were important regulators. Temperature effects, cell sinking, cell decomposition, nutrient recycle, and predation were included. For the case of phosphorus-dependent growth of a single algal species, the proposed model predicts a lag between phosphorus removal from solution and subsequent algal growth. Because of luxury phosphorus uptake, 85% of the algal crop developed after 50% of the phosphorus had been removed. It is concluded that detailed knowledge of the complex metabolic processes that occur inside microorganisms is not necessary in order to develop a realistic, analytical model of algal growth. Results of the two-species system in which phosphorus is the regulating nutrient, show that species differences in phosphorus uptake efficiencies and in minimum phosphorus requirements are sufficient causes to explain the frequently observed correlation between nuisance blooms of blue-green algae and low nutrient concentrations. A higher degree of internal stability can be obtained in a two-species system as opposes to a single-species system. (See also W74-06560) (Jones-Wisconsin)

RATES OF CARBON, OXYGEN, NITROGEN, AND PHOSPHORUS CYCLING THROUGH MICROBIAL POPULATIONS IN STRATIFIED LAKES,

Notre Dame Univ., Ind. Dept. of Chemical Engineering; and Notre Dame Univ., Ind. Dept. of Civil Engineering.
C. F. Cordeiro, W. F. Echelberger, Jr., and F. H. Verhoff.

In: Proceedings of a workshop on Modeling the Eutrophication Process, September 5-7, 1973, Logan, Utah, Water Research Laboratory, Utah State University, November 1973, p 111-120. 4 fig, 4 tab, 22 ref.

Descriptors: *Eutrophication, *Mathematical models, *Cycling nutrients, Carbon, Oxygen, Nitrogen, Phosphorus, Microorganisms, Population, Lakes, Stratification, Nutrients, Kinetics, Chemical properties, Dynamics, Bacteria, Bicarbonates, Phosphates, Ammonia, Nitrates.
Identifiers: *Lake restoration, Microbial cell growth, Stoichiometry.

Cycling rates of carbon, oxygen, nitrogen, and phosphorus through the various components of a lake system were investigated with a mathematical model to determine the major nutrient sources and the system components which use most of each element as a guide to which species may be most affected by changes in the system and enable a qualitative prediction of the results of corrective actions. The kinetics of cell growth were developed from a mechanism which postulates that this growth is accomplished by the transport of metabolites from the exterior of the cell to the interior, and the chemical conversion of these chemicals into cellular photoplasm. The elemental composition of the microbial population was determined from an average composition and used as a basis for deriving the various stoichiometric relationships used in the model. The lake was simulated as consisting of two layers, each with its set of biological and chemical components. The symbiotic activity of the algae and bacteria as regards to oxygen and bicarbonate production and utilization is clearly evident in the model. It is also possible to study the sources and sinks of the other elements. The settling and silting rate can also be determined from the model. (See also W74-06560) (Auen-Wisconsin)

CAPABILITIES AND LIMITATIONS OF NUTRIENT-PLANKTON MODEL,

Washington State Univ., Pullman. Dept. of Zoology and Washington State Univ., Pullman. Dept. of Computer Science.
R. A. Parker.

In: Proceedings of a workshop on Modeling the Eutrophication Process, September 5-7, 1973, Logan, Utah, Water Research Laboratory, Utah State University, November 1973, p 121-130. 6 fig, 3 tab, 14 ref.

Descriptors: *Nutrients, *Plankton, *Mathematical models, *Eutrophication, Ammonia, Plant growth, Mortality, Copepods, Crustaceans, Temperature, Photosynthesis, Phosphates, Nitrogen, Nitrates, Phytoplankton, Chlorophyll, Seasonal, Light intensity.
Identifiers: *Kootenay Lake(British Columbia), Lake restoration.

A detailed evaluation of the course of eutrophication suggests a strategy of model formulation which focuses on nutrient-plankton relationships. Since ammonium may be used preferentially as a nitrogen source by certain phytoplankters, this study evaluates the performance of a coupled system of nutrient and plankton differential equations which incorporated this assumption in contrast to one without preference. The growth and mortality functions adopted for the algal groups, and for the two zooplankton groups (cladocerans and copepods) are tabulated. Horizontal transport is recognized for each variable, and vertical diffusivity has been included for the nutrients. Only the upper 'mixed' layer was modeled, limited to 10 m so that virtually all photosynthetic activity was included. Photosynthetic rate, nutrient uptake, and cell nutrient content may or may not all exhibit Monod dependence on external nutrient concentration. Simulation results for phytoplankton, phosphate, nitrate, ammonium, copepods, and cladocerans are presented for a three-year period. It seems apparent that the model does not depend heavily on modifications in the Monod nitrate-ammonium growth functions, nor on the half-saturation constant for phosphate. The performance of this model is under the over-riding influence of a structure inherently dependent on temperature and light intensity. (See also W74-06560) (Jones-Wisconsin)

PHYTOPLANKTON POPULATION CHANGES AND NUTRIENT FLUCTUATIONS IN A SIMPLE AQUATIC ECOSYSTEM MODEL,

Federal Water Quality Administration, Athens, Ga. National Pollutants Fate Research Program.
R. R. Lassiter, and D. K. Kearns.

In: Proceedings of a workshop on Modeling the Eutrophication Process, September 5-7, 1973, Logan, Utah, Water Research Laboratory, Utah State University, November 1973, p 131-138. 4 fig, 11 ref.

Descriptors: *Mathematical models, *Phytoplankton, *Biota, *Nutrients, *Physicochemical properties, Ecosystems, Light, Temperature, Eutrophication, Phosphorus, Succession, Biomass, Seasonal, Dynamics, Hydrogen ion concentration.

This oversimplified model consists of equations describing a physicochemical system and associated biota. Physical aspects of the system consist of light, temperature, and an atmosphere containing 0.033% carbon dioxide. Chemical aspects consist of a set of dissolved inorganic and organic chemicals. It is assumed that the organic chemicals do not participate directly in the chemical equilibria. The biotic system consists of six phytoplankton species and heterotrophic microorganisms. The model contains explicit equations for the phytoplankton, but the heterotrophic microorganisms are included only implicity. Algal growth rates are temperature dependent. Among results obtained thus far are those which point to timing of significant ecological events (such as phosphorus reaching critically low concentrations) as important in phytoplankton competition. In some cases pH may prove to be a good indication of the time of occurrence of such events. It is also postulated that fast growing phytoplankton may dominate the early growing season, while slower growing forms capable of using lower nutrient concentrations may dominate a later season growth when their ability to utilize nutrients equals or exceeds the rate of bacterial remineralization. AQUATIC MODELING IN THE EASTERN DECIDUOUS FOREST BIOME, U.S.-INTERNATIONAL BIOLOGICAL PROGRAM,
Rennsselaer Polytechnic Inst., Troy, N. Y.
J. A. Bloomfield, R. A. Park, D. Scavia, and C. S. Zahoreak.
In: Proceedings of a workshop on Modeling the Eutrophication Process, September 5-7, 1973, Logan, Utah, Water Research Laboratory, Utah State University, November 1973, p 139-158. 7 fig, 8 tab, 32 ref. AG-199,40-193-69.

Descriptors: *Ecosystems, *Computer programs, *Eutrophication, Methodology, Hydrology, Biota, Nutrients, Biomes, Mathematical models, New York, Wisconsin.
Identifiers: *Eastern Deciduous Forest Biome, Lake George(N.Y.), Lake Wingra(Wis), Biome model CLEAN, WNGRA2 model, PL/1 FORTRAN, DYNAMO, UNIVAC 1108, IBM 370/165, Model Components, SIMPLE model.

To predict the consequences of perturbations of aquatic ecosystems, Lake George, New York and Lake Wingra, Wisconsin were the bases of mechanistic aquatic models capable of forecasting nutrient enrichment effects, thermal pollution, siltation and other by-products of man's activities; in addition the models present a degree of ecologic insights gained through the large-scale integrated studies of the International Biological Program. Q-mode cluster analysis and ordination of data helped to confirm that Lake George sampling stations were representative of differing degrees of eutrophication. R-mode cluster analysis and data ordination from both Lake George and Lake Wingra are helping in the definition of functional groups. CLEAN is programmed in modular form so that one can execute a specific submodel, such as for net phytoplankton, or link any meaningful combination of submodels as required. WNGRA2 is a site-specific model of mixed levels of resolution. SIMPLE is an eighth-order nonlinear compartmental model structured primarily to examine effects of excessive phosphate loadings and was designed specifically to simulate Lake George conditions but, with only slight modifications can be applied to any lake. The state variables represent larger ecologic groupings than in CLEAN, the time step is weekly, and the model considers only the most significant transfers. (See also W74-06560) (Auen-Wisconsin)

A PHYSICAL MODEL FOR SIMULATION OF AQUATIC ECOSYSTEMS,
Federal Water Quality Administration, Athens, Ga. National Pollutants Fate Research Program.
J. W. Falco, and W. M. Sanders, III.
In: Proceedings of a workshop on Modeling the Eutrophication Process, September 5-7, 1973, Logan, Utah, Water Research Laboratory, Utah State University, November 1973, p 159-169. 13 fig, 3 tab, 6 ref.

Descriptors: *Eutrophication, *Model studies, *Prototypes, Turbulence, Streamflow, Dispersion, Reaeration, Channels, Light quality.
Identifiers: *Aquatic Process Simulator.

The Aquatic Ecosystem Simulator was designed as a process physical model, as opposed to a geometric or hydrodynamic model, which would simulate biological and chemical responses of natural flowing streams to a wide range of environmental perturbations. In addition to providing information on microbial growth kinetics, the simulator will provide the capability for introducing significant material gradients along the length of a water channel and thus provide a facility to study the role of transport phenomena in environmental water quality problems. A third feature is the variable light source which simulates solar radiation, not only in terms of total intensity but also in terms of spectral distribution for the study of photosynthetic processes. The reason for the delays between the development of partially controlled streams and studies with microcosms and development of scaled physical models is largely one of cost; this facility cost approximately $1 million. In addition to the physical calibrations, microbial growth experiments with bacterial and mixed bacterial and algal populations will be performed to measure growth rates of these organisms as function of turbulent mixing rates, water temperature, nutrient concentration, and other pertinent environmental parameters. ACTIVITY ANALYSIS AND THE MANAGEMENT OF RESOURCES: A MODEL FOR CONTROL OF EUTROPHICATION,
Utah Water Research Lab., Logan.
D. B. Porcella, A. B. Bishop, and W. J. Grenney.
In: Proceedings of a workshop on Modeling the Eutrophication Process, September 5-7, 1973, Logan, Utah, Water Research Laboratory, Utah State University, November 1973, p 171-186. 10 fig, 3 tab, 14 ref. EPA 68-01-0728.

Descriptors: *Cost-benefit analysis, *Model studies, *Management, *Eutrophication, *Phosphorus, Welfare(Economics), Costs, Control, Decision making, Lake Erie, Analysis, Water quality control.
Identifiers: *Phosphorus management, Phosphorus loading, Cost-effectiveness, Case study.

This study aimed at achieving a relatively complete understanding of phosphorus inputs as a management tool for phosphorus control. The system in which phosphorus is utilized is described, possible alternatives for controlling phosphorus input to surface waters determined and the least-cost strategy for controlling that phosphorus input ascertained. The model can be applied to any region or river basin using easily obtainable data. With Lake Erie as an example, changes in phosphorus input due to various management tactics resulted in changes in relative eutrophication. Treatment costs associated with management strategies were related to effectiveness, and use of cost-effectiveness analysis for selecting the most comprehensive set of management factors is deomonstrated. Conclusions are that use of activity analysis to control the effects of a particular resource, in this case, phosphorus, is a reasonable approach. Management of a resource rather than treatment alone should be instituted when real costs of management controls are less than treatment costs saved or avoided. In Lake Erie use of management controls can result in significant treatment cost savings. A combination of management controls and treatment processes can result in lowering eutrophication levels to about the mesotrophic range, at least, with respect to phosphorus loadings. COMPONENT DESCRIPTION AND ANALYSIS OF ENVIRONMENTAL SYSTEMS: OXYGEN UTILIZATION IN AQUATIC MICROCOSMS,
Georgia Univ., Athens; and Utah Water Research Lab., Logan.
J. Hill, IV, and D. B. Porcella.
In: Proceedings of a workshop on Modeling the Eutrophication Process, September 5-7, 1973, Logan, Utah, Water Research Laboratory, Utah State University, November 1973, p 187-203. 8 fig, 5 tab, 27 ref.

Descriptors: *Design, *Model studies, *Analysis, *Methodology, *Energy transfer, Simulation analysis, Hydrologic systems, Systems analysis, Eutrophication, Mud-water interfaces, Mathematical models, Computers, Equations.
Identifiers: *Component analysis, *Component description, System transfer function, System properties.

The technique of component description and systems analysis is applied to an environment system, specifically to aquatic microcosms serving as analogues for the mud-water environment of eutrophic lakes. Component description of environmental systems is a detailed method of arriving at a system model which includes a great deal of information concerning processes of energy transfer and transformation. If component values are not available or accessible for measurement, the component analysis is tedious and expensive. However, the component values resulting from a component analysis are applicable to the same component in a similar system; therefore, some component analyses need only be done once. Modeling of environmental systems for impact studies, development planning, or similar purposes with specific applications to a specific area is probably best done using compartmental techniques. Modeling environmental systems to understand processes, general application of controls, and man-made perturbations is probably best done using component techniques. The analysis demonstrated illustrates the analytical process and attempts to point out some of the pitfalls as well as advantages in the application of the technique. PREDICTING THE EFFECTS OF NUTRIENT DIVERSION ON LAKE RECOVERY,
Battelle Pacific Northwest Lab., Richland, Wash.
M. W. Lorenzen.
In: Proceedings of a workshop on Modeling the Eutrophication Process, September 5-7, 1973, Logan, Utah, Water Research Laboratory, Utah State University, November 1973, p 205-210. 1 tab, 2 fig, 5 ref.

Descriptors: *Mathematical models, *Forecasting, *Nutrients, *Diversion, Lakes, Reclamation, Eutrophication, Sediments, Methodology.
Identifiers: Lake restoration, Nutrient diversion, Nutrient concentrations.

Model derivations are summarized showing how different assumptions about nutrient exchange processes can result in varying predictions concerning lake recovery. Model I is that in which net loss of nutrient to the sediment is considered proportional to the average concentration of that nutrient in the water. Model II considers both loss to sediments and return from sediments as independent processes and assumes that nutrient concentration in the sediment does not change appreciably over time. Model III considers coupled equations describing transfer into and out of sediments. All three models are idealized and simplified representations of complex precesses. Models II and III not only represent improvement over existing models but show important variables. Because data available for comparing these models are limited, hypothetical conditions were used for example calculations summarizing various parameters for four lakes. These values were used to calculate nutrient concentrations as a function of time illustrating that each model can predict very different results. Any model should first be checked to insure that it predicts accurately prediversion lake conditions before it is used to evaluate the effects of nutrient diversion. The seemingly disparate results are due to initial conditions which are not at steady state with loading rates. (See also W74-06560) (Jones-Wisconsin)

AN ECOLOGICAL ACCOUNT OF THE PAST AND FUTURE OF SOUTH AFRICAN RIVERS,
National Inst. for Water Research, Congella (South Africa). Regional Lab.
F. M. Chutter.
Limnological Society of South Africa Newsletter No. 21, p 22-34, November 1973. 48 ref.

Descriptors: *Ecology, Rivers, *Water quality, *Biota, Aquatic life, Water storage, Soil erosion, Land management, Reservoir operation, Water pollution control, Water pollution effects.
Identifiers: *South Africa.

Changes brought about in South African rivers by human activities in the past, and their known effects on the biota are described. Probable future changes in rivers are described in relation to population growth, agricultural practice and water consumption. Rivers will be increasingly affected by impoundments and diffuse sources of chemical contaminants. While the biological consequences of many types of change may be predicted, little is known about the effects of impoundments and their management on rivers downstream of impoundments in South Africa. UTILIZATION OF PHOSPHORUS BY PHYTOPLANKTON IN PHOSPHORUS-RICH ENVIRONMENTS,
Georgia Inst. of Tech., Atlanta. School of Biology.
J. R. Strange.
Available from the National Technical Information Service as PB-231 304, $3.25 in paper copy, $1.45 in microfiche. Georgia Environmental Resources Center, Atlanta, ERC-1373, January 1974, 34 p, 23 fig, 2 tab, 11 ref, 3 append. OWRR A-035-GA(1). 14-31-0001-3810.

Descriptors: *Phosphorus, *Phytoplankton, *Eutrophication, *Algae, Waste assimilative capacity, Absorption, *Georgia.
Identifiers: *Lake Sidney Lanier(Geo), Phosphorus uptake, Chlorococcum, Fragillaria, Nostoc.

A study was made of the eutrophic Flat Creek embayment of Lake Sidney Lanier near Gainesville, Georgia, to determine to what degree phosphorus in luxury concentration could be utilized by various species of phytoplankton. Three prominant species of algae, Chlorococcum, Fragillaria and Nostoc, were grown under experimental conditions to determine their response to luxury amounts of phosphorus. Unialgal cultures were established in modified Winegradsky columns with a modified Chu's No. 10 medium. Phosphate levels of 0.15 ppm resulted in rapid growth, and the cultures reached maximum biomass levels after two or more weeks. Luxury amounts of P32 were added to a 100 ml sample from the enriched culture, increasing by more than 34-fold the concentration of phosphorus. Uptake of P32 varied from less than 20% for Nostoc to greater than 80% of the P32 added for Chlorococcum. However, if Nostoc was previously deprived of phosphorus, its subsequent uptake ability increased markedly. For the species studied, P32 uptake was directly proportional to the surface-per-volume ratio, similar to results found in marine benthic algae. These results show that phytoplanton can uptake large amounts of phosphorus entering a lake through municipal or industrial waste discharges, but further research is needed to ascertain whether removal of phosphorus by this means retards eutrophication or whether the phosphorus continues up the food chain.

STUDIES ON THE PHOTOSYNTHETIC PIGMENTS AND THEIR DECOMPOSITION IN THE SEDIMENT OF LAKE BALATON AND LAKE BELSO,
Magyar Tudomanyos Adademia, Tihany. Biological Research Inst.
J. Olah.
Ann Inst Biol (Tihany) Hung Acad Sci. 39. p 115-121, 1972. Illus.
Identifiers: Benthos, *Chlorophyll, Decomposition, *Hungary(Lake Balaton), Lakes, *Photosynthetic pigments, Primary production, *Hungary(Lake Belso), *Lake sediments, Anaerobic conditions.

In the examination period, the chlorophyll-a content of the mud surface in Lake Balaton (Hungary) was 29-71 mg/m2. The Moss and Tietjen ratios as well as the absorption spectra and the pheo-pigment content computed by using the equation of Lorenzen showed that a large proportion of the pigment was in an active condition. These results suggest that the contribution of the microphytobenthos to the primary production of the lake is considerable. The chlorophyll-a content of the superficial layer of the mud in the highly eutrophic Lake Belso was 66 mg/m2, with a highest proportion of pheo-pigments. In the upper 12 cm layer of mud the pigments were of homogeneous distribution. The pheo-pigments are suggested to originate from the rich phytoplankton, and their destruction is retarded by the semi-anaerobic condition of the water sediment interface.--Copyright 1973, Biological Abstracts, Inc.

ORGANIC PHOSPHORUS COMPOUNDS OF A NORTHERN MICHIGAN BOG, BOG-LAKE SYSTEM,
Michigan Univ., Ann Arbor. School of Natural Resources.
J. P. Koenings, and F. F. Hooper.
In: Nutrient Cycling and Productivity of Dystrophic Lake-Bog Systems (Part A). December 1972, p 3-22. 6 fig, 2 tab, 32 ref. ORA 016440, AEC AT(11-1)-1771.

Descriptors: *Phosphorus compounds, *Dystrophy, *Bogs, *Lakes, Trophic level, Tracers, Cycling nutrients, Analytical techniques, Organic acids, *Michigan.
Identifiers: *North Gate Lake(Mich.), Polyphosphates.

Certain Michigan bog lakes do not follow the high productivity pattern concomitant with high phosphorus content common in enriched eutrophic lakes. This study describes the chemical nature and distribution of the organic phosphorus compounds in North Gate Bog, bog-lake system and presents data from a P-32 labeling experiment which bears upon the dynamics and cycling of these compounds and upon the paradoxical relationship between nutrient level and productivity. Optical density in the ultraviolet at 260 nm in conjunction with ion exchange chromatography separation of the inorganic and organic acids containing phosphorus was used for determination of the hydrolysis products of the ribonucleic acids as well as the related free mono-, di-, and triphosphorylated nucleotides as part of dissolved organic phosphorus. Compounds produced in the bog mat appear to be hydrolysis products of ribonucleic acids as well as free mono-, di-, and triphosphate nucleotides. While inorganic phosphorus of the epilimnion and the mat waters appears to be chiefly orthophosphate, the hypolimnion contains an inorganic pool consisting of both ortho- and polyphosphate phosphorus. Lack of polyphosphates in the hypolimnion dicates that these compounds arise from in situ a tolysis of algae or bacteria rather than fr materials produced in the euphotic zone (See al W73-14185) (Auen-Wisconsin)

PRELIMINARY REPORT OF THE ROLE SPHAGNUM IN THE CYCLING PHOSPHORUS IN A BOG-LAKE SYSTEM,
Michigan Univ., Ann Arbor. School of Natu Resources
F. F. Hooper.
In: Nutrient Cycling and Productivity Dystrophic Lake-Bog Systems (Part A) Decemb 1972, p 23-48. 8 fig, 2 tab, 7 ref. ORA 016440, AE AT(11-1)-1771.

Descriptors: *Cycling nutrients, *Phosphoru *Mosses, Bogs, Lakes, Tracers, Phosphorus co pounds, Organic compounds, Weather, Dy trophy, *Michigan.
Identifiers: *Bog mats, North Gate Lake(Mich.)

The North Gate Bog (Michigan) mat was i vestigated to determine the phosphorus retu flow from the bog mat to the lake, the rates exchange between the water and mat, and define the chemical characteristics of t phosphorus compounds involved. The stab phosphorus of the mat interstitial water was me sured and a section of the bog mat labeled. T marginal circulation scheme offers a pathw whereby both autochthonous seston and lochthonous debris can penetrate through t strong thermal barrier present in the lake duri spring and summer. First, P-32 was appli directly to the Sphagnum surface producing leachate consisting entirely of soluble unreacti phosphorus which was flushed into the lake wh rains created a hydrological gradient of flo within the mat; this leachate not only penetrat the surface water but also entered the hypoli nion. A second label, which was injected direct into the interstitial water of the mat, produced leachate which was an entirely particulate unrea tive phosphorus; this was also flushed into the la and persisted in the surface water with little or loss or transformation in excess of three week Both of the label fractions penetrated to the low parts of the hypolimnion. IONIC STATE AND COORDINATION OF IRO IN BOG LAKES,
Michigan Univ., Ann Arbor. School of Natur Resources.
J. P. Koenings.
In: Nutrient Cycling and Productivity Dystrophic Lake-Bog Systems (Part A). Decemb 1972, p 51-71. 5 fig, 6 tab, 27 ref. ORA 06144 AEC AT(11-1)-1771.

Descriptors: *Iron compounds, *Bogs, *Lake *Solubility, Distribution, Oxidation reductio potential, Hydrogen ion concentrations, Analyt cal techniques, *Michigan.
Identifiers: Ionic ferrous iron, Ferric iron, Nort Gate Lake(Mich.).

Separation and characterization of iron com pounds present in the epilimnion and in th hypolimnion of acid bog North Gate Lake and als an assessment of the effects of reduced organi compounds on the forms of iron are described. I a dilute, low pH solution, as in a bog, Fe(I becomes or remains ionic because of the wea ability of Fe(II) to form complexes. The anaerobi hypolimnion and the low dissolved oxygen con centration in the epilimnion, combine with a hig amount of reducing substances, both organic an inorganic, and the low pH to provide an enviro ment in which Fe(II) is preferred. The presence o ionic Fe(II) without complexation as the predom nant form of iron in the deoxygenated waters o

the bog is confirmed. Results can be explained in terms of loose iron III-colored organic associations that allow iron to react as ionic ferric iron, probably due to a loose charge-to-charge interaction between un-ionized or weakly ionized organic acids, and Fe(III) produced by the oxidation of Fe(II) diffusing upward from the hypolmnion. pH controls the relative roles of iron and organic matter in oxygenated water. EFFECTS OF OIL DISPERSANTS AND OIL EMULSIONS ON MARINE ANIMALS,
Kristinebergs Zoologiska Station, Fiskebackskil (Sweden).
M. Swedmark, A. Granmo, and S. Kollberg.
Water Research, Vol 7, No 11, p 1649-1672, November 1973. 12 fig, 8 tab, 40 ref.

Descriptors: *Oil pollution, *Toxicity, *Bioassay, Fish, Mussels, Crabs, Water temperature, Salinity, Lethal limit, Sea water, Water pollution effects, Marine animals, Fjords, Respiration, Animal physiology, Fish behavior, Movement, Surfactants.
Identifiers: *Oil dispersants, *Oil emulsions, *Crude oil, Cod(Fish), Flounders, Bivalves, Cockles, Scallops, Prawns, Continuous flow technique, Macroinvertebrates, Fuel oil, Diesel oil.

The toxicities to marine animals of nine oil dispersants, three oil emulsions with Corexit and of a dispersion of Oman crude oil, were studied in continuous flow aquarium systems at 96 hr exposures followed by a recovery period in clean seawater. New types of dispersants were found to be less toxic than older types and oil emulsions more toxic than dispersants alone or crude oil alone. Fishes and bivalves were found most sensitive. Crustaceans were the most resistant to dispersants but very susceptible to oil emulsions. The tolerance of different species was found to be related to their mode of life, more active species being more susceptible. Delayed mortality of bivalves increased their susceptibility if the recovery period was included. Effects on locomotory behavior of fishes and crustaceans, breathing rate of fish, valve-closure of bivalves and byssal thread formation of common mussels have been demonstrated for both dispersants and oil emulsions. The general sequence of such effects was: increased activity; successively impaired activity; immobilization; and death. Recovery is good for fish and crustaceans but poor for bivalves due to the delayed effects. Ecological consequences of dispersants and oil pollution in the marine environment are discussed. SURVIVAL IN MATURATION PONDS OF COLIFORM BACTERIA WITH TRANSFERABLE DRUG RESISTANCE,
National Inst. for Water Research, Pretoria (South Africa).
W. O. K. Grabow, and I. G. Middendorff.
Water Research, Vol 7, No 11, p 1589-1597, November 1973. 6 tab, 41 ref.

Descriptors: *Water pollution effects, Resistance, Sewage treatment, *E. coli, *Sewage lagoons, Separation techniques, Pathogenic bacteria, Population, Antibiotics(Pesticides), Bactericides.
Identifiers: *Drugs, *Survival, *Salmonella typhi, Ampicillin, Chloramphenicol, Kanamycin, Streptomycin, Tetracycline, Bacterial physiology, South Africia.

The use of antimicrobial drugs which produces bacterial resistance that is mediated by R factors and is transferrable to other species raises questions regarding the survival of these bacteria in maturation ponds. Consequently studies were undertaken to investigate the behavior of drug-resistant coliform bacteria in a series of sewage maturation ponds in South Africa. Samples were collected from three ponds, the coliforms isolated, and E. coli I identified. The nalidixic acid-resistant strains E. coli E25 and Salmonella typhi N were used as recipients. Groups of 20 resistant coliforms selected at random from every sample were tested for transferable resistance. The average reduction through the ponds of coliforms resistant to ampicillin, Chloramphenicol, kanamycin, streptomycin or tetracycline was 6.83 percent lower than that of drug-sensitive bacteria. This difference was mainly due to coliforms with transferable resistance (R(plus) coliforms) which increased from 0.86 percent to 2.45 percent through the ponds. The spectrum of transferable resistance of coliforms in the effluent did not differ notably from that of coliforms in the influent. The averageincidence of Escherichia coli I among R(plus) coliforms decreased from 66.08 percent to 62.09 percent. This indicates that low-level transfer of R factors may occur in ponds. Possible mechanisms and the epidemiological significance of the increased survival of R(plus) coliforms in maturation ponds are discussed. (Little-Battelle)

CULTURE STUDIES OF ENTEROMORPHA LINZA (L.) J.AG. AND ULVARIA OXYSPERMA (KUTZING) BLIDING (CHLOROPHYCEAE, ULVALES) FROM CENTRAL AMERICA,
North Carolina Univ., Wilmington. Dept. of Biology.
D. F. Kapraun, and E. H. Flynn.
Phycologia, Vol 12, Nos 3/4, p 145-152, December 1973. 26 fig, 32 ref.

Descriptors: *Cultures, *Chlorophyta, *Marine algae, *Cytological studies, Plant morphology, Marine plants, Chromosomes, Benthic flora.
Identifiers: Central America, *Enteromorpha linza, *Ulvaria oxysperma, Culture media, Sample preservation, Sample preparation, *Columbia, *Costa Rica.

Enteromorpha linza and Ulvaria oxysperma from Columbia and Costa Rica, respectively, were studied by observations of material collected from nature and laboratory culture experiments. Cultures were maintained in enriched seawater media in an open-room incubator illuminated with 1500 lux incident light at 23C with 12-hr light and a 12-hr dark cycle. The algae were stained for chromosomes using a modified technique described by Kapraun (1970). Plant material was fixed in an 12KI-formalin solution during the middle of the dark cycle, washed in distilled water after 12 hr, and placed in an iron-alum mordant. Fronds were soaked in the mordant 2-5 min, rinsed thoroughly in distilled water and stained in acetocarmine for observation. Results of these investigations were compared with the literature from Japanese and European studies. Both E. linza and U. oxysperma were shown to be haplobiontic, reproducing exclusively by bi- and quadriflagellate zoospores. Results of cytological investigations are discussed: N equals 10 was indicated for E. linza, while no determination was possible for Ulvaria. (Holoman-Battelle)

TEMPERATURE CONTROL OF REPRODUCTION AND PRODUCTIVITY IN A SUBARCTIC CORALLINE ALGA,
National Museum of Natural History, Washington, D. C.
W. H. Adey.
Phycologia, Vol 12, Nos 3/4, p 111-118, December 1973. 12 fig, 8 ref.

Descriptors: *Water temperature, *Primary productivity, Reproduction, *Bioassay, *Light intensity, *Limiting factors, Growth rates, Ice cover, Marine algae, Atlantic Ocean, Oxygen, Seasonal, Rhodophyta, *Pacific Ocean, Physiological ecology.
Identifiers: *Clathromorphum circumscriptum.

Based on detailed quantitative distributional data for the North Atlantic and qualitative data for the North Pacific, a hypothesis of winter temperature control of reproduction and distribution is formulated for the crustose coralline alga Clathromorphum circumscriptum. The hypothesis, that winter temperatures below 2-3C are required for reproduction, was tested by growing plants for extended periods under various light and temperature conditions. Regimes from constant light cycle (12-12) and intensity (1200 lux) at a temperature of 12-13C, to reduction of both light and temperature over a 5 month interval to 6-18 hr light-dark periods, 130 lux and 0C, were employed in a manner approximately simulating the natural pattern in the shallow sublittoral of the Maine coast. Although conceptacle production was initiated in those tanks where the light cycle was reduced from 12 to 6 hr per day, mature conceptacles with bispores developed only in the tanks where the temperature was reduced. The most prolific plants were those subject to reduction of light cycle and intensity. In tanks having neither temperature nor light cycle reduction, only a very small percentage of primordial conceptacles were initiated and none of these developed to maturity. The productivity of Clathromorphum circumscriptum, based on oxygen exchange measured with a precision polarographic electrode, was examined at light intensities ranging from 0-4000 lux and temperatures ranging from 0-20C. The compensation point was reduced markedly with temperature, reaching levels of only 35 lux near 0C. This indicates a high level of efficiency in net productivity at very low temperatures, and suggests that under arctic conditions holoautotrophic plants probably can survive even where ice cover and winter darkness significantly reduce total light received. (Little-Battelle)

INFLUENCE OF IODINE ON GROWTH AND DEVELOPMENT OF THE BROWN ALGA ECTOCARPUS SILICULOSUS IN AXENIC CULTURES,
Scripps Institution of Oceanography, La Jolla, Calif.
M. L. Woolery, and R. A. Lewin.
Phycologia, Vol 12, Nos 3/4, p 131-138, December 1973. 4 fig, 13 ref.

Descriptors: *Marine algae, *Plant growth, *Iodine, *Essential nutrients, Deficient elements, *Phaeophyta, Bioassay, Plant physiology, Kelps, Marine plants, Cultures, Nutrient requirements, Laboratory tests, Germination, Plant pigments, Chlorophyll, Colorimetry.
Identifiers: *Ectocarpus siliculosus, Axenic cultures, Survival, Culture media, Carotenoids.

A quantitative evaluation was made of the iodine requirement of the brown alga Ectocarpus siliculosus using solely the female clone. Cultures were grown in (1) artificial seawater medium, of the same composition and prepared by the same method as was the starvation medium; (2) artificial seawater medium prepared similarly, but with sodium chloride which had not been pre-treated to remove iodine and bromine; (3) natural seawater; and (4) seawater similarly depleted of iodine and bromine. In a preliminary experiment prepared in quadruplicate, iodine and bromine were added, independently and together, and after 2, 4, 6, and 8 wk. growth in the first set of tubes was assayed colorimetrically for mixed chlorophylls and carotenoids. Another experiment was carried out to determine the effects of iodine concentrations lower than that in seawater. After 2, 3, and 4 wk. the algae were examined microscopically for the abundance of reproductive organs and zoospores and assayed colorimetrically. Nutrient-supplemented cultures were then incubated for an additional 6 wk, and reassayed for restoration of pigmentation. Filaments of E. siliculosus survived for at least 12 wk in iodine-deficient media; however iodine is an essential nutrient for growth. Iodine is not replaceable by bromine at any of the concen-

trations tested. At least 0.0015 microgram at iodine/l is required for any appreciable vegetative growth, while 0.025 microgram at/l is needed for the normal formation and maturation of plurilocular sporangia. (Natural seawater contains about 0.4 microgram at iodine/l). In 12-wk cultures, 0.2 microgram at iodine/l promotes maximum growth, equivalent to 4 g dry weight per litre of medium. Concentrations up to one hundred times as high are tolerated without evident inhibitory effects. (Holoman-Battelle)

HORIZONTAL PHYTOPLANKTON STUDIES IN LAKE BALATON BASED ON SCOOPED SAMPLES AND FILTRATES TAKEN IN 1967,
Magyar Tudomanyos Akademia, Tihany. Biological Research Inst.
G. Tamas.
Ann Inst Biol (Tihany) Hung Acad Sci. 39. p 151-188, 1972. Illus.
Identifiers: *Chlorophyta, *Chrysophyta, Cyanophyta, Euglenophyta, Filtrates, Lakes, Mycophyta, *Phytoplankton, Pyrrophyta, Seasonal, *Hungary(Lake Balaton), Sampling, Distribution.

In the period between April and Nov., 1967, 495 scooped samples and 117 net-filtrates from 15 sampling sites of 5 transversed sections were examined. Identified were 147 spp., 11 varieties and 2 forms belonged to 6 phyla according to the following distribution: Cyanophyta 18, Euglenophyta 11, Pyrrophyta,5, Chrysophyta 65, Chlorophyta 60, Mycophyta 1. The number of individuals and species (709,700/1) was the biggest in the Aug. collections from the Bay of Keszthely. The smallest number of species (44) and individuals (79,900) was registered in the Nov. collections of Balatonalmadi-Balatonvilagos and Sagpuszta-Balatonszemes, respectively. Chrysophytes had the highest values for both species and individual numbers as well as percentage in the summer samples taken in the Bay of Kaszthely. During 1967 the distribution of the phytoplankton in Lake Balaton (Hungary) was uniform both horizontally and seasonally.--Copyright 1973, Biological Abstracts, Inc.

AN EXAMINATION OF THREE STRAINS OF THE BLUE-GREEN ALGAL GENUS, FREMYELLA,
East Tennessee State Univ., Johnson City. Dept. of Biology.
J. T. Wyatt, T. C. Martin, and J. W. Jackson.
Phycologia, Vol 12, Nos 3/4, p 153-161, December 1973. 7 fig, 4 tab, 20 ref.

Descriptors: *Growth stages, *Cultures, *Metabolism, Behavior, *Plant morphology, *Cyanophyta, Systematics, Isolation, Sampling, Growth rates.
Identifiers: *Fremyella.

Placed in the family Scytonemataceae by some authorities and by others in the Microchaeteaceae, the blue-green algal genus Fremyella often exhibits seemingly paradoxical behavioral patterns. Its growth characteristics and its metabolic rates indicate the genus to be ecologically competitive. On the other hand, its infrequent occurrence in most experimental algal collections suggests just the opposite. Three strains of Fremyella produced widely different data which suggested that the genus probably occupies terrestrial, subaquatic, and aquatic systems. However, the results did not truly explain the rarity of the genus. (Little-Battelle)

LEAD INHIBITION OF HORMOTILA BLENNISTA (CHLOROPHYCEAE, CHLOROCOCCALES),
Rutgers - The State Univ., New Brunswick, N.J. Dept. of Botany.
T. J. Monahan.
Phycologia, Vol 12, Nos 3/4, p 247, December 1973. 1 tab, 8 ref. Grant No 07-2177.

Descriptors: *Lead, *Inhibition, *Plant growth, *Bioassay, Deficient elements, Heavy metals, *Soil algae, Chlorophyta, Pollutants, Cultures, Environmental effects, Light, Phosphates, Potassium, Nutrients.
Identifiers: Pollutant effects, Survival, *Hormotila blennista.

Hormotila blennista, a unicellular green soil alga, was cultured in modified Bristol's solution deficient in the potassium phosphate salts to which had been added the trace element mix of Watt and Fogg (1966) and known concentrations of lead chloride. Autoclave sterilization, axenic cultures, and sterile techniques were routinely used. After autoclaving, culture media ranged between pH 6.4 and 6.6. Cultures were grown in 50 ml of medium and incubated at 22 plus or minus 1.0C under continuous fluorescent illumination supplying 3000 to 4000 lux light intensity. Dark experiments were performed by placing cultures in sealed cardboard boxes in the growth chamber. Cells were harvested during the declining growth phase and counts made to determine the effect of lead on growth. When contrasted to control cultures, significant inhibition was noted in the light at all lead concentrations tested from 50-500 ppb (P less than 0.001) and in the dark at 50 ppb (P less than 0.01), and 100, 250, and 500 ppb (P less than 0.0001). It was concluded that the effects of lead among the algae may be particularly accentuated under stressful conditions of essential nutrient deficiency, such as phosphate and potassium as exemplified by H. blennista. GROWTH OF STREPTOCOCCUS CREMORIS AND STREPTOCOCCUS LACTIS IN A CHEMOSTAT. PRODUCTION OF CELLS AND SURVIVAL OF BACTERIA DURING FROZEN STORAGE,
National Research Council of Canada, Ottawa (Ontario). Div. of Biological Sciences.
I. J. McDonald, B. Reiter, and P. L. Rogers.
Canadian Journal of Microbiology, Vol 19, No 10, p 1285-1295, October 1973. 12 fig, 1 tab, 24 ref.

Descriptors: *Streptococcus, *Growth rates, *Cytological studies, *Cold resistance, Nutrients, Hydrogen ion concentration, Freezing, Cultures, Temperature, Limiting factors.
Identifiers: *Sample preservation, Survival, *Culture media, Viable count, Chemostat, Sample preparation.

Streptococcus cremoris HP and Streptococcus lactis 829 were grown in chemostats in tryptone yeast extract broth and in supplemented 2 percent skim milk medium. In both media lactose was the limiting nutrient. Cultures were grown at various dilution rates in media poised at constant pH and temperature and also at constant dilution rates in media controlled at different pH levels and temperatures. The effects of the various conditions of growth of production of bacteria, viable counts, and acid-producing activities of cells and on the ability of bacteria to survive subsequent frozen storage were determined. None of the conditions of growth tested had very pronounced effects on the ability of cells to survive or on the inability of cells to retain acid-producing activity after being frozen at -70C and stored at -40C. (Mortland-Battelle)

OXIDATION OF N-ALKANES BY CLADOSPORIUM RESINAE,
Dayton Univ., Ohio. Dept. of Biology.
J. D. Walker, and J. J. Cooney
Canadian Journal of Microbiology, Vol 19, No 10, p 1325-1330, October 1973. 3 fig, 3 tab, 29 ref.

Descriptors: *Cultures, *Microbial degradation, *Oxidation, Growth rates, Organic compounds, Organic acids, Oxygen demand, Metabolism, Alcohols.
Identifiers: Substrate utilization, *Biooxidation, *Cladosporium resinae, Dodecane, Hexadecane, Hexane, Hexanol, Hexanal, Dodecanal, Hexadecanal, Aldehydes, Cycloheximide, *Alkanes.

Cells of two hydrocarbon-using strains of Cladosporium resinae grown on glucose oxidize hydrocarbons without a lag when transferred to dodecane, hexadecane, or their primary alcohols, aldehydes, or acids. Cycloheximide does not limit oxygen uptake when cells are transferred from glucose to dodecane or hexadecane. Isocitrate lyase levels are not higher in alkane-grown cells than in glucose- or glutamic acid-grown cells. Glucose-grown cells have higher Q sub O2 values than hydrocarbon-grown cells when placed on dodecane or hexadecane. Thus, n-alkane-oxidizing enzymes are constitutive in C. resinae. Cells oxidize dodecanal and hexadecanal though they do not grow on them. Whole cells and cell-free preparations oxidize dodecane, hexadecane, and their primary alcohols and aldehydes, indicating that the oxygenated compounds may be intermediates in alkane oxidation. Hexane, which supports little growth, inhibits oxygen uptake of whole cells below the endogenous level, as do hexanol and hexanal, although cell-free preparations oxidize all three six-carbon compounds. Hexane inhibits oxygen uptake on hexadecane. Therefore, hexane does not appear to be transported into cells and may interfere with membrane function. (Little-Battelle)

MERCURY AS A HYDROSPHERIC POLLUTANT II. BIOLOGICAL HALF-TIME OF METHYL MERCURY IN FOUR MEDITERRANEAN SPECIES: A FISH, A CRAB, AND TWO MOLLUSCS,
International Lab. of Marine Radioactivity, Monte Carlo (Monaco).
J. K. Miettinen, M. Heyraud, and S. Keckes.
Paper presented at FAO Technical Conference on Marine Pollution and its Effects on Living

Resources and Fishing, No FIR:MP/70/E-9, November 5, 1970. 8 p, 2 fig, 1 tab, 30 ref.

Descriptors: *Mercury, *Bioassay, Marine fish, *Molluscs, *Crabs, *Metabolism, *Radioisotopes, Pollutants, Metals, Environmental effects, Aquatic animals, Analytical techniques, Organic compounds, Testing, Laboratory tests, Sampling.
Identifiers: Serranus scriba, Carcinus maenuas, Tapes decussatus, Mytilus gallo provincialis.

Fish (Serranus scriba), decapod crabs (Carcinus maenuas), and two types of bivalve molluscs (Tapes decussatus and Mytilus gallo provincialis) were taken from the Ligurian Sea in order to ascertain whether their excretion of methyl mercury follows similar rates and routes as in parallel species from brackish and fresh waters. A mercury radioisotope was administered to the animals as methylmercury nitrate and initial loss and slow loss were measured by whole body counting with scintillation counters. The counting error was estimated to remain below plus or minus 2%. All the comparative analyses point to a similar pattern of excretion rates in fresh water, brackish and marine organisms. Generally a large fraction of the administered compound has a slow loss rate. The biological half-time depends on the method of methyl mercury's entry into the organism, being longer after intramuscular injection than after peroral administration. (Jerome-Vanderbilt)

INTERACTION OF TEMPERATURE AND COPPER IONS AS ORIENTING STIMULI IN THE LOCOMOTOR BEHAVIOR OF THE GOLDFISH (CARASSIUS AURATUS),
Texas A and M Univ., College Station. Dept. of Biology.
H. Kleerekoper, J. B. Waxman, and J. Matis.
Journal of the Fisheries Research Board of Canada, Vol 30, No 6, p 725-728, 1973. 3 fig, 1 tab, 3 ref. EPA Project 18050 DWQ.

Descriptors: *Temperature, *Copper, *Fish behavior, Heat, Light, Swimming, Heavy metals, Time, Movement, Laboratory tests, Water pollution effects, Fish attractants.
Identifiers: *Sub-lethal effects, *Goldfish.

Movements of single goldfish (Carassius auratus) were monitored in a free choice situation comprising zones of laboratory water or copper-containing water (0.01 ppm as CuCl2) each at two temperatures, 21.1 plus or minus 0.1 and 21.5 plus or minus 0.1C. The interaction between the copper ion proper and the gradient of copper concentration creates stimulus conditions that cannot be accounted for by the concentration of copper ions alone. This experiment was performed to ascertain whether a similar interaction occurs between copper and temperature in their combined effect on the orientation of locomotion in the goldfish. The experiments were carried out in an acrylic tank kept under constant light. The tank was divided into 16 parts leaving an open area in the center. The data representing the number of photoelectric gates triggered by the fish and the time of entry or departure were punched on paper tape and transposed to magnetic tape for computer processing. Fish entered the copper zone at 21.1C significantly less frequently and spent less time there per entry as compared to the copper-free zone ('avoidance behavior'). The copper zone at 21.5C became significantly 'attractive' to the fish in terms of both frequency of entry and time spent. The effects of copper ion and of the temperature were based on an analysis of variance. The presence of the copper ions in the absence of heat brings about a significant decrease in both percentage of entries and time spent per entry. Temperature rises in the presence of copper produced an increase in both the percentage of the entries into the compartment and the time spent per entry. (Tirfie-Vanderbilt)

DOSE-RESPONSE RELATIONSHIP ASSOCIATED WITH KNOWN MERCURY ABSORPTION AT LOW DOSE LEVELS OF INORGANIC MERCURY,
Michigan Univ., Ann Arbor. School of Publich Health.
R. G. Smith.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 207-222, 1972, 5 tab, 4 fig, 17 ref.

Descriptors: *Mercury, Air pollution, *Public health, *Industrial plants, *Air pollution effects, Pollutants, Heavy metals, Environmental effects, Human pathology, Toxicity, Testing, Sampling, Data collection, Evaluation.
Identifiers: *Industrial hygiene.

Approximately 75 to 85% of mercury inhaled is absorbed and this is the primary source of mercury entering the body. Mercury is oxidized in the blood with major accumulations occurring in the brain with possible effects on the central nervour system. No clinical evidence of mercurialism was found among workers exposed to less than 100 micrograms of mercury per cubic meter of air. Mercury studies performed in large chlorine plants to determine dose-response relationships are reported. Environmental mercury in all the plants sampled was measured and information about 567 employees was collected. Age distribution, length of employment and cigarette smoking habits of the employees were compared with mercury levels to develop time-weighted averages for exposure. The employees examined were in good health and in no way distinguishable from the control population in comprehensive tests. There was a somewhat higher incidence of a number of neuropsychiatric symptoms, based on subjective responses. (See also W74-06770) (Jerome-Vanderbilt)

SURFACE ELECTROMYOGRAPHY IN CHRONIC INORGANIC MERCURY INTOXICATION,
Michigan Univ., Ann Arbor. Dept. of Industrial Engineering.
D. B. Chaffin, and B. D. Dinman.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 222-229, 1972.

Descriptors: *Mercury, *Air pollution, *Human pathology, *Toxicity, Pollutants, Heavy metals, Air pollution effects, Public health, Laboratory tests, Measurement, Evaluation, Analytical techniques.
Identifiers: *Electromyography, *Occupational health, Industrial hygiene.

In August 1970 a survey by the Institute of Environmental and Industrial Health of a tungsten-carbide alloy recovery facility indicated high airborne concentrations of mercury which would present a probable health hazard. The four employees of this shop were subjected to medical examination, including an electromyographic evaluation of their muscle action potential. This system presents a graphical and numerical plot of the amplitude of the different complex muscle action components which are reported as a histogram and compared to developed power spectra norms. The production worker and the owner of the firm showed signs and symptoms of chronic mercurialism, including loss of appetite and weight, impaired sleep, nightmares, ease of fatigue and personality changes. The spectral analysis of the electromyograms revealed signal abnormalities in both patients. Application of this method to a population with less chronic exposure needs further investigation. Factors such as drugs and medications, concomitant pathological states, physical fitness, and recent physical work affect the electromyographic record. (See also W74-06770) (Jerome-Vanderbilt)

BIOTRANSFORMATION OF ORGANO-MERCURIALS IN MAMMALS,
Rochester Univ., N.Y. Dept. of Radiation Biology; and Rochester Univ., N. Y. Dept. of Biophysics.
T. W. Clarkson.

In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 229-238, 1972. 3 tab, 1 fig, 23 ref.

Descriptors: *Mercury, *Human pathology, *Metabolism, Pollutants, Human diseases, Toxicity, Organic compounds, Inorganic compounds, Laboratory tests, Chemical reactions, Evaluation, Investigations, Measurements, Public health, Heavy metals.
Identifiers: *Biotransformation, *Organomercurials, Methylation, Diuretics.

Two major pathways of biotransformation of organo-mercurials are discussed: (1) a cleavage of the mercury bond resulting in the release of inorganic mercury; (2) a chemical change in the organic moiety resulting in a modified organo-mercuric compound which further reacts and leads to the eventual release of inorganic mercury. It is known that inorganic mercury is accumulated by kidney tissue, thus relative rates of biotransformation may be obtained by comparing the fraction of inorganic mercury in kidneys after single doses of different organo-mercurial compounds. The possibility that the release of inorganic mercury from organo-mercurial compounds accounts for the toxicity of those compounds is discussed. The distribution of mercury was examined and it was found that inorganic mercury is accumulated and stored in the cortical tissue of the kidneys. Since mercurial diuretics are excreted much more rapidly than inorganic mercury, biotransformation of these compounds to inorganic mercury will result in increased retention of mercury in the body. The phenyl and methoxyethyl mercurials appear to be excreted at approximately the same rate as inorganic mercury. (See also W74-06770) (Jerome-Vanderbilt)
W74-06802

THE BINDING OF INORGANIC AND ORGANIC MERCURY COMPOUNDS (HG 203) TO CONSTITUENTS OF NORMAL HUMAN BLOOD,
Creighton Univ., Omaha, Nebr.
H. A. Guirgis, W. K. Stewart, and W. Taylor.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 239-246, 1972. 3 fig, 5 tab, 4 ref.

Descriptors: *Mercury, *Radiochemical analysis, *Metabolism, *Human pathology, *Proteins, Dialysis, Pollutants, Heavy metals, Inorganic compounds, Organic compounds, Analytical techniques, Separation techniques, Biochemistry, Electrophoresis, Public health.
Identifiers: *Organomercurials, *Human blood, Clinical studies.

The relative uptake of 203 Hg-labelled mercuric chloride (Hg Cl2), phenylmercuric acetate (PMA) and methylmercuric nitrate (MMN) by normal human blood, was studied in vitro. The uptake of HgC12, PMA, and MMN by erythrocytes and plasma varied from one compound to another. Binding of mercury compounds to the serum proteins was confirmed, using both dialysis and gel-filtration techniques. Electrophoretic separation of the mercuric compound and serum mixture was utilized to identify the protein fraction which binds each of the mercuric compounds in vitro. In vivo inhibition of glutathione reductase, phosphoglucose isomerase, glucose-6-phosphate dehydrogenase and caeruloplasmin were affected by mercuric chloride, phenylmercuric acetate and mersalyl. BIOLOGICAL REACTIONS AND PATHOLOGICAL CHANGES IN HUMAN BEINGS AND ANIMALS CAUSED BY ORGANIC MERCURY CONTAMINATION,
Kumamoto Univ. (Japan). Medical School.
T. Takeuchi.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 247-289, 1972. 15 fig, 11 tab, 76 ref.

Descriptors: *Mercury, *Human pathology, *Animal pathology, *Public health, Pollutants, Toxicity, Environmental effects, Absorption, Organic compounds, Inorganic compounds, Water pollution, Diseases, Biology, Water pollution sources, Investigations.
Identifiers: *Methylation, *Japan(Minamata disease).

A summary is presented of mercury pollution in water, its effects on the human and animal populations and the absorption of mercury by different organs. The major sources of methylmercury in water are discharges from acetaldehyde manufacturing plants, use of mercuric agricultural products, and the formation of methylmercury chloride. The effects of mercury poisoning were studied in the areas of Niigata and Minamata Bay after hazardous concentrations were found in water there. The three major pathological symptoms of the disease are cerebellar ataxia, constriction of visual fields and dysarthria. In fetal cases of the disease disturbances of mental and motoric development result. In animals, notably cats, unsteady and slow movement, atoxic gait and paroxysmal convulsions were the main symptoms. Postmortem liver, kidney and brain tissue from humans who suffered from acute and sub-acute cases of Minamata disease had high mercury content. The various effects of methylmercury and alkyl mercury on tissue cells were tested and reported. (See also W74-06770) (Jerome-Vanderbilt)
W74-06804

THE DOSE-RESPONSE RELATIONSHIP RESULTING FROM EXPOSURE TO ALKYL MERCURY COMPOUNDS,
Michigan Univ., Ann Arbor. School of Public Health.
B. D. Dinman, and L. H. Hecker.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 290-301, 1972. 4 tab, 20 ref.

Descriptors: *Mercury, *Diets, *Toxicity, *Metabolism, *Human pathology, Pollutants, Inorganic compounds, Organic compounds, Public health, Foods, Investigation, Poisons, Lethal limits, Heavy metals.
Identifiers: Blood, Hair.

A review of the human dose-response relationship resulting from exposure to alkylmercury compounds is presented on the basis of available literature. The normal range of mercury loading in populations which live in uncontaminated areas and have diets which do not include contaminated fish is presented. This level is considered to be 10 micrograms or less per day. The mercury levels in blood were compared to those in hair. The normal mercury level in blood is considered to be between 0.5 micrograms and 1.0 microgram per 100 ml of whole blood. The blood mercury levels of 8 patients with obvious symptoms of mercury intoxication were between 290 and 440 micrograms per 100 ml of blood. The whole blood mercury concentration in a case of fatal mercury poisoning was estimated to 400 micrograms per 100 ml blood. It appears that alkylmercury levels of up to 100 micrograms per 100 ml blood are not clearly associated with readily detectable deleterious effects. The problems associated with the detection of minimal alkyl mercury intoxication are discussed and recommendations are made. (See also W74-06770) (Jerome-Vanderbilt)
W74-06805

THE RELATIONSHIP BETWEEN MERCURY CONCENTRATION IN HAIR AND THE ONSET OF MINAMATA DISEASE,
Kumamoto Univ. (Japan). School of Preventive Medicine.
T. Takeuchi.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 302-304, 1972. 2 fig, 2 ref.

Descriptors: *Mercury, *Human pathology, *Laboratory tests, Pollutants, Toxicity, Biochemistry, Metabolism, Poisons, Water pollution, Environmental effects, Diseases, Analytical techniques, Chemical analysis, Lethal limit, Pathology.
Identifiers: *Minamata disease, Hair, *Japan(Niigata).

A close relationship between mercury concentrations in human hair and mercury poisoning was discovered during investigations of mercury contamination in Niigata. Results from those investigations are presented. Mercury intoxication was evident in individuals whose hair contained from 52 to 570 ppm mercury. Some of the individuals who had high mercury concentrations in their hair were not affected by mercury intoxication. In Minamata, some clinical signs of mercury poisoning were observed in individuals with only 10 - 20 ppm mercury in their hair. Some factors indicate a greater inherent sensitivity of the fetus than of children or adults to organic mercury loadings. (See also W74-06770) (Jerome-Vanderbilt)
W74-06806

ORGANIC MERCURY POISONING IN ALAMOGORDO, NEW MEXICO,
New York State Dept. of Health, Albany.
A. Hinman.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 304-305, 1972. 1 tab.

Descriptors: *Mercury, *Human pathology, *Poisons, *Seed treatment, Pollutants, Toxicity, Biochemistry, Metabolism, Food, Diets, Food chains, Diseases, Public health, Treatment, Analysis, Pathology, *New Mexico.
Identifiers: *Methylation, Poisoning.

In a case of mercury poisoning in Alamogordo, New Mexico three children were affected after eating contaminated meat. Their father, a farmer, had obtained seed grain which had been treated with methylmercury dicyandiamide to feed his stock. A hog which had eaten the grain was butchered and eaten by the family. The hog's meat contained 27.5 ppm of mercury. The three children were treated with British anti-lewisite (BAL) to increase urinary mercury excretion and also with n-acetyl-d, l,-penicillamine but no clinical improvement was noted. After about three to four months, gradual improvement was observed but all three patients remained severely impaired. (See also W74-06770) (Jerome-Vanderbilt)
W74-06807

SURVIVAL AND REPRODUCTION OF RING-NECKED PHEASANTS CONSUMING TWO MERCURIAL FUNGICIDES,
Michigan State Univ., East Lansing. Dept. of Fisheries and Wildlife.
W. J. Adams, and H. H. Prince.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 306-317, 1972. 8 fig, 1 tab, 14 ref.

Descriptors: *Mercury, *Mortality, *Reproduction, *Birds, *Food chains, *Seed treatment, Pollutants, Toxicity, Growth rates, Organic compounds, Inorganic compounds, Analysis, Laboratory tests, Animal pathology.
Identifiers: Methylmercury, Poisoning, Pheasants.

The effects of two mercurial fungicides used in seed treatment, methylmercuric dicyaniamide and phenylmercuric acetate, on the survival and reproduction of pheasants were investigated. Two groups of birds were fed food treated with different concentrations of the two compounds, daily

nd at three day intervals respectively. Eggs were collected, stored and incubated and chicks were weighed, banded, and placed in brooder houses. All birds fed untreated food survived. One of the 11 hens fed phenylmercury died during the 74 day test period. Ten of the hens fed methylmercury died, and it appeared that a cumulative consumption level of about 24.7 mg of methylmercury was fatal with signs of mercury poisoning occurring between 13 to 17 mg. Egg production of hens fed methylmercury declined, beginning in the second week. Although no decline was observed for hens fed phenylmercury, both compounds had an adverse effect on hatchability. The amount of embryonic mortality during the first 14 days of development was 70%, 62%, and 48% for methylmercury, phenylmercury, and control groups respectively. Consumption of more than 4 mg of methylmercury would seriously decrease hatchability. Consumption of 16 mg of methylmercury or more would result in cessation of egg production in pheasant hens. (See also W74-06770) (Jerome-Vanderbilt)
W74-06808

DOSE-RESPONSE RELATIONSHIPS AFTER EXPOSURE OF SWINE TO ORGANO-MERCURIAL COMPOUNDS,
Saskatchewan Univ., Saskatoon. Western Coll. of Veterinary Medicine.
L. Tryphonas.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 318-319, 1972.

Descriptors: *Hogs, *Mercury, *Poisoning, *Toxicity, *Laboratory tests, Pollutants, Organic compounds, Inorganic compounds, Environmental effects, Human pathology, Analysis, Chemical analysis, Diseases, Public health, Lethal limit, Biochemistry, Measurement.
Identifiers: *Organomercurials.

The effects of methyl mercuric dicyandiamide (MMD), ethyl mercuric chloride (EMC) and phenyl mercuric chloride (PMC) on swine were investigated, to find the levels at which mercury poisoning became evident. The daily dosages ranged from 0.19 to 4.56 mg of mercury per kg. MMD produced clinical disease at about 0.76 mg Hg/kg/day, EMC produced disease at about 0.38 mg Hg/kg/day and PMC caused predominantly kidney damage with signs of disease only above 2.28 mg Hg/kg/day. The alkyl mercury compounds affect the brain, causing decrease in cerebrum volume and cytolysis of neurons. The effect of alkyl mercury compounds on the kidneys is not severe. This study confirms a relatively high toxicity to swine of alkyl mercury compounds as compared to aryl mercury compounds. The accumulation of mercury compounds in certain organs of swine become a hazard to public health. (See also W74-06770) (Jerome-Vanderbilt)
W74-06809

DETECTION AND APPRAISAL OF SUBCLINICAL INTOXICATIONS,
Duke Univ. Medical Center, Durham, N.C.
L. J. Goldwater.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 319-325, 1972. 2 fig, 4 tab, 10 ref.

Descriptors: *Mercury, *Human pathology, *Toxicity, *Biochemistry, Pollutants, Inorganic compounds, Organic compounds, Poisons, Analysis, Proteins, Analytical techniques, Public health, Enzymes, Heavy metals, Pathology, Pollutant identification, Path of pollutants.
Identifiers: *Subclinical effects, Clinical studies.

The inadequacies of some of the present methods of determining subclinical levels of mercury intoxication are reviewed and areas of research which may yield more exact evaluations are suggested. Methods such as testing the blood and urine mercury levels prove inadequate because there is no critical level of mercury regularly associated with them. Often, by the time significantly increased levels are observed, biological damage has already occurred. The low grade absorption of some mercury compounds may result in a slight increase in excretion of protein but detection methods are complex and do not lend themselves to simple tests. Some biochemical tests which are based on the affinity of mercury for sulfhydryl-containing enzymes have been investigated and show promise. Coproporphyrins, delta-aminolevulinic acid, lactose dehydrogenase, serum phosphoglucose isomerase and serum gluthathione reductase are some of the substances which have been studied. It is suggested that mercury, like several other heavy metals, may be beneficial to the biological processes at very low levels, but toxic in higher concentrations. Further investigation of low levels of mercury and its enzymatic functions is necessary in order to understand subclinical intoxication. (See also W74-06770) (Jerome-Vanderbilt)
W74-06810

APPROACHES TO THE DETECTION OF SUBCLINICAL MERCURY INTOXICATIONS: EXPERIENCE IN MINAMATA, JAPAN,
Kumamoto Univ. (Japan). Medical School.
T. Takeuchi.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 325-328, 1972. 1 fig, 3 ref.

Descriptors: *Mercury, *Organic compounds, *Human pathology, *Toxicity, *Subclinical effects, Pollutants, Inorganic compounds, Poisons, Environmental effects, Analytical techniques, Water pollution, Testing procedures, Diseases, Public health, Pathology, Mortality, Industrial wastes.
Identifiers: *Japan, Subclinical effects, Minamata disease, Methylmercury, Clinical tests.

Pathological findings indicated three types of Minamata disease. The first was a complete type of Hunter-Russell's syndrome; the second was incomplete with only one of the basic symptoms exhibited; and the third was a latent type which showed none of the clinical symptoms. This evidence indicated that there were problems with differential diagnosis which resulted from incomplete or masked symptoms. The pathological changes which occurred were the disappearance of granular cells in the cerebellum under the Purkinje layer and a decrease in the nerve cells of both calcarine regions. These stages were found even in patients who exhibited no clinical symptoms. Sural nerve biopsy has been proposed as most useful for diagnosis with mercury determination, because this nerve tends to be most easily disturbed in sensory peripheral nerves. Visual microscopic examination reveals a relative increase of smaller fiber, below 3 microns, and a decrease of normal size fibers, with collagen proliferation. The correlation between Minamata disease and mercury concentrations in hair indicates that this may be a useful diagnostic tool. (See also W74-06770) (Jerome-Vanderbilt)

BIOLOGICAL EFFECTS OF MERCURY COMPOUNDS, DISCUSSION PAPER,
Rochester Univ., N. Y.
T. W. Clarkson, B. D. Dinman, J. C. Gage, L. J. Goldwater, and H. Guirgis.
In: Environmental Mercury Contamination, Ann Arbor Science Publishers, Inc., Michigan, p 341-345, 1972. 4 ref.

Descriptors: *Mercury, Reviews, *Toxicity, *Distribution, *Absorption, *Human pathology, Pollutants, Inorganic compounds, Organic compounds, Analytical techniques, Poisons, Diseases, Testing procedures, Biochemistry, Diets, Food chains, Heavy metals, Water pollution.
Identifiers: *Methylation, Subclinical effects, Accumulation, Minamata disease.

Although early studies of the toxicity of inorganic and organic mercury and mercury vapor supplied much valuable information, there are many problems remaining in measuring objectively the effects of the substances at a threshold level. Differences in the absorption and distribution of ionic mercury and metallic mercury vapor are discussed. The possibility of inorganic mercury undergoing methylation in man is unlikely. The stabilities of different organo-mercury compounds in vivo vary, as do their toxicities. The inhibition of the oxygen-carrying capacities of hemoglobin resulting from some forms of mercury intoxication may stimulate hemoglobin production. Fetal and infant mercury intoxication is discussed, based on information from Minamata and Niigata studies. The most important difference between inorganic and methylmercury poisoning is the irreversibility of the neurological symptoms which accompany methylmercury poisoning. Analysis of hair may be a good system for monitoring mercury levels in humans. Although detection of subclinical intoxications by methylmercury is difficult, new methods must be developed because of the irreversible nature of the disease. AQUATIC VEGETATION OF THE OTTOWA RIVER NEAR CHALK RIVER NUCLEAR LABORATORIES (CRNL),
Atomic Energy of Canada Ltd., Chalk River (Ontario). Chalk River Nuclear Labs.
S. R. Gentner.
Available from NTIS, Springfield, Va., as Rept. No. AECL-4511. $4.00 in paper copy, $1.45 in microfiche.

Descriptors: *Survey, *Aquatic plants, Rivers, Vegetation, Data collections, *Nuclear powerplants, Effluents, Water pollution, Ecology, Radioecology, *Radioactivity effects, Research and development, *Food chains, Public health, *Canada.
Identifiers: *Ottawa River(Canada).

In the summer of 1972 a preliminary survey of the aquatic vegetation in the Ottawa River near the Chalk River Nuclear Laboratories from the Pump House downstream to Pte. au Bapteme on the Ontario side was undertaken. Maps showing the distribution of the vegetation along the shoreline and in the water were drawn up, and a checklist of all the vascular plants found was compiled. A complete survey of the aquatic vegetation may be viewed as the first step towards studying the changing patterns of aquatic vegetation due to activities at CRNL, as a means of identifying local plants for experimental use, as a means of learning the primary producers in the aquatic food chains of the river, and as the basis for future radioecological studies. ENERGETICS OF DAPHNIA AMBIGUA,
Kansas Water Resources Research Inst., Manhattan.
K. B. Armitage.
Available from the National Technical Information Service as PB-231 356, $3.25 in paper copy, $1.45 in microfiche. Contribution No. 129, December 1973. 27 p, 7 tab, 16 ref. OWRR A-043-KAN(1). 14-31-0001-3516.

Descriptors: *Daphnia, *Seston, *Nitrogen, *Growth rates, *Kansas, Population, Chlorophyll, Akalinity, Photosynthesis, Zooplankton, Aquatic animals, Phosphates, Ponds, Growth stages, Temperature.
Identifiers: *Oxygen consumption, *Filtering rate(Daphnia), Orthophophates, Nitrate nitrogen.

The population cycle of the zooplankten D. ambigua was followed in a one hectare pond at the University of Kansas. D. parvula and D. pulex also occur in the same pond. D. ambigua predominates during the colder season from November through early June when water temperatures are below 20 degrees C. The population peak of D. ambigua in May is followed by that of D. pulex and then D. parvula. Growth of D. ambigua was measured under field and laboratory conditions. Both the time of egg development to hatching and of first instar to adult were slower at lower environmental temperatures. At the same temperature developmental times were shorter in the laboratory. The maximum size was smaller at each higher temperature over a temperature range of 6.5 to 26.6 degrees C. Clutch size decreased markedly at temperatures above 15 degrees C. Metabolic rates were consistent with rates measured under laboratory regimes of temperature acclimation. The filtering rate was higher at higher temperatures; large animals had higher filtering rates than small animals at low temperatures but had lower filtering rates than small animals at high temperatures. D. ambigua filtered particles of 2 to 5.04 microns in diameter. Gross photosynthetic rate, seston concentration, and chlorophyll a concentration were determined as measures of food available to the daphnid populations. Orthophosphate generally was high; nitrogen in the form of ammonia exceeded nitrate nitrogen; total alkalinity was low in summer and fall and high in winter and spring. These results will be used to calculate an energy budget for the D. ambigua population.

DISTRIBUTION OF AUTOTROPHIC NITRIFYING BACTERIA IN A POLLUTED STREAM,
Rutgers - The State Univ., New Brunswick, N.J. Dept. of Environmental Science.
M. S. Finstein, and V. A. Matulewich.
Available from the National Technical Information Service as PB-231 357, $3.75 in paper copy, $1.45 in microfiche. Water Resources Research Institute, New Brunswick, New Jersey, February, 1974. 61 p, 2 fig, 28 tab, 41 ref. OWRR A-030-N.J.(2). 14-01-00013230.

Descriptors: *Nitrification, Water pollution effects, *Microbial degradation, Environmental effects, Nitrates, Microorganisms, Path of pollutants, *Oxygen demand, *New Jersey.
Identifiers: Nitrosomonas, Nitrobacter, *Nitrogenous oxygen demand, *Nitrifying bacteria, *Passaic River(N.J.), Environmental surfaces, Microbial ecology.

The nitrogenous oxygen demand exerted by sewage and secondarily treated effluent may seriously lower the water quality of receiving streams. Comprehensive stream management requires the ability to predict where this component of the oxygen demand will be exerted, and at what rate. Efforts to include nitrification in stream models are unlikely to be highly successful without some understanding of the ecology of the responsible organisms. The present investigation was undertaken to provide such information. The distribution of nitrifying bacteria in bulk waters, on surfaces, and in muds at 11 Passaic River sites was studied using most-probable-number procedures. In mud samples taken from the mud-water interface, nitrifiers were from 21 to 140,000 (average 515) times more abundant (volumetrically) than in the overlying waters. Nitrifiers were found throughout a 21 cm profile of mud, the highest densities occurring in the topmost levels. Large numbers of these bacteria were associated with aquatic plants, algae, and slimes on rocks. There was no correlation between nitrifier density and river flow. Ammonium-oxidizers outnumbered nitrite-oxidizers in all but one of the 112 samples examined by a factor from 1.7 to 5310 (average 20.9). These data suggest that high river velocities may bring into suspension substantial numbers of nitrifiers. The relative scarcity of nitrifying bacteria in bulk waters and their abundance at surfaces is suggestive that surfaces may be the more important site of nitrification in rivers. (Whipple-Rutgers)

BASIC RESEARCH IN THE AQUATIC ENVIRONMENT: EFFECTS OF EUTROPHICATION ON PHYTOPLANKTON POPULATIONS AND SELECTED SPECIES OF AQUATIC VASCULAR PLANTS,
Cornell Univ., Ithaca, N.Y. Water Resources and Marine Sciences Center.
H. F. Mulligan.
Available from the National Technical Information Service as PB-231 358, $3.25 in paper copy, $1.45 in microfiche. Completion Report, December 1973. 43 p, 3 fig, 7 tab, 21 ref. OWRR B-011-NY(1). 14-01-0001-1533.

Descriptors: *Aquatic weed control, *Eutrophication, *Nutrient removal, *Pollution abatement, *Water pollution control, *Water pollution effects, Aquatic weeds, Aquatic productivity, Nitrogen, Phosphorus, *Phytoplankton, Pollutants, Ponds, Soil-water plant relationships, Water Chemistry.
Identifiers: Experimental ponds, Phytoplankton-aquatic weed interactions, Fertilizer pollution.

Planktonic algae and benthic plants are in direct competition. An increase in one component usually is accompanied by a decline in the population of the other. Continuous fertilization with N and P above the level of .05 mg N/l and .005 mg P/l leads to a dominance in the summer phytoplankton population. A cessation and enrichment causes the plant population to return to natural levels. The concentrations of P-PO4 remain high and it appears that nitrogen is the more limiting of the two elements under natural conditions. Prolonging the cover of the ice has the same consequence as adding additional nitrogen to the water. Elodea canadensis and Potamogeton crispus are favored by high nutrient levels whereas Chara sp., Myriophyllum spicatum var. exalbescens and Ceratophyllum demersum are eliminated. Although aquatic environments can recover rapidly from enrichment and re-establish near normal vegetation conditions, they are liable to be easily disturbed by unusual natural occurrences such as prolonged ice cover due to exceptionally cold winters.

ENVIRONMENTAL ASPECTS OF PLUTONIUM AND OTHER ELEMENTS, A SELECTED ANNOTATED BIBLIOGRAPHY.
Oak Ridge National Lab., Tenn
Aval NTIS, Springfield, Va., as Rept No EIS-74-21 (Suppl. 2); $7.60 per copy, $1.45 microfiche Report No. ORNL-EIS-74-21 (Supp. 2), February 1914. 282 p, 438 ref, 1 append, 7 indexes

Descriptors: *Monitoring, *Environment, *Plutonium, *Ecology, *Ecosystems, *Bibliographies, Bioassay, Biological communities, Chemical properties, Physical properties, Radiation, Radioecology, Radioactive waste disposal, Nuclear explosions, Water pollution, Soil contamination.
Identifiers: *Nevada Test Ste.

This third published bibliography of 438 references from the computer information file built to provide support to its sponsor, the Nevada Applied Ecology Group of the AEC Nevada Operations Office, emphasizes the early (before 1962) unclassified and declassified literature that concerns plutonium, uranium, and the Nevada Test Site (NTS). Included are environmental aspects of the nuclear devices tested at the NTIS, supporting investigations that provide background information on the Test Site, such as basic studies of the flora, fauna, and geology of that area, and basic biological and medical studies on the effects of plutonium and uranium, particularly as they relate to health considerations for man. Every reference provides an abstract. Abstracts are findings-oriented. Additional numerical data are included in a special field or referred to in the comment field. Indexes are given for author, subject category, keywords, geographic location, permuted title, taxons, and publication description. (Houser-ORNL)

A comparative zooplankton study was undertaken as part of a multi-disciplinary study of the effects of offshore waste disposal on the waters of the New York Bight. The emphasis has been placed on copepods because they occur in this area the year round and are usually the principal constituent of zooplankton. Samples were collected by net towing (0.5m diameter, No. 8 mesh) at surface, mid-, and bottom depths at 15 stations and preserved in 4 percent buffered formaldehyde. Laboratory counts were made by diluting the samples to a known volume, mixing until a uniform suspension occurred, and then removing 1 ml subsamples until at least 300 copepods were tallied and identified. Settled and displacement volumes were measured; organisms greater than 15 mm in diameter were not included in the displacement volume. In conjunction with the zooplankton samples, total iron, nitrate and three kinds of phosphates were measured to trace movements of sewage sludge and industrial acid wastes. Of the samples collected (January 1969 - April 1970), the average number of copepods per cubic meter ranged from 700 to 41,000 and was within the range reported in other middle Atlantic Coastal waters. Statistical analyses of the samples showed a vertical distribution pattern for the organisms. The displacement volumes of sewage, trace amounts to 9.3 ml/cu, apparently had no short term effects on the number of organisms found; however, most were likely to be killed in acid water of concentrations 1 : 1000 or greater. (Long-Battelle)

THE EFFECTS OF WASTE DISPOSAL IN THE NEW YORK BIGHT. SECTION 5: CHEMICAL STUDIES.
National Marine Fisheries Service, Highlands, N.J. Sandy Hook Sports Fisheries Marine Lab.
Available from the National Technical Information Service as AD-739 535, $1.45 in microfiche. Final Report, February 1972. 185 p, 271 fig, 18 tab, 500 ref.

Descriptors: *Waste disposal, *Zooplankton, *Trace elements, *Water pollution effects, Dissolved oxygen, Salinity, Temperature, Turbidity, Hydrogen ion concentration, Pesticides, Sediments, Oxidation-reduction potential, Nutrients, Water analysis, Primary productivity, Selenium, Zinc, Silver, Rubidium, Cobalt, Sea water, Benthos, Microbiology, Crustaceans, Fish, Water pollution sources, Drifting(Aquatic), Sedimentation, Sewage sludge, Water pollution, Nitrates, Phosphorus, Iron, Measurements, Sampling, Spectrophotometery, On-site tests, Flow, Oil, Phosphates, Copper, Lead, Chromium, Mercury, Chlorophyll, Organic compounds.
Identifiers: Petrochemicals, Biological samples, Environmental samples, Sample preservation, Sample preparation, Dredge spoils, Chlorophyll a, Finfish, *New York Bight, Orthophosphates, Organic phosphorus, Flounder, Muscle, Liver, Scophthalmus aquosus, Pseudopleuronectes americanus, Pseudopleuronectes, Paralichthys oblongus, Paralichthys dentatus, Urophycis, Hormarus americanus, Spisula solidissima, Cyprina, Cancer.

Samples of water, sediments, and organisms were collected from the New York Bight and analyzed to determine the distribution and fate of sewage sludge, dredging spoils, and acid wastes disposed. Samples were collected during 27 cruises from the surface, mod-depth, and bottom in areas with depths of 23 to 27 meters. Water samples were collected with a Van Dorn sampler and divided into subsamples for analysis of iron, chlorophyll a, phosphate, nitrate and DO. Subsamples were stabilized where necessary. Temperature, salinity, turbidity, and pH were also measured. Sediment samples were collected with plastic Phleger coring tubes from the upper 5 cm of a Smith-McIntyre grab, stored in plastic bags, and frozen for later analysis of petrochemicals, copper, lead, chromium, mercury, pesticide metabolites, and determination of redox potential. Populations of benthic organisms and zooplankton were also determined. The methods employed for the analyses are described. From the data, it was concluded that: (1) Acid wastes tend to remain in a distinct pattern after disposal, (2) Sewage sludge results in turbid, phosphorus-rich water containing particulate matter, (3) There was no demonstrable increase in primary productivity as a result of nutrification, (4) Bacteriological activity in sludge depletes the overlying waters of oxygen to levels insufficient to support life, (5) Dredging spoils on bottom sediments contain enough petroleum to harm bottom-dwelling organisms, and (6) The heavy metals, Cu, Pb, Cr, and Hg, originating in sewage and dredging spoils, were found in water, sediments, and animal tissues at toxic levels. (Long-Battelle)

Water and Sewage Works, Vol 120, No 12, p 36-46, December 1973. 3 fig, 7 tab, 11 ref.

Descriptors: *Phosphorus, *Bioassay, *Sewage effluents, *Plant growth, *Toxicity, Biomass, Measurement, Waste dilution, Nutrients, Water pollution effects, Sewage, Sewage treatment, *Growth rates, Suspended solids, Cyanophyta, Chlorophyta, Optical properties, Trace elements, Laboratory tests, Detergents.
Identifiers: *Selenastrum capricornutum, *Anabaena flos-aquae, Dilution, Particulate carbon, Optical density.

The responses are presented of Anabaena flos-aquae and Selenastrum capricornutum to detergent and nondetergent phosphorus. Maximum growth and mean growth rate are discussed with maximum growth being based upon the first and last biomass measurements during the growth cycle (18 or 21 days). Mean growth rate represents growth over a 7-day period. Correlation between particulate carbon (PC), optical density (OD) and suspended solids (SS) was performed to establish the relations between the individual parameters. Dilution studies were made to detect toxicity, indicated by unusual growth as a function of dilution. Deionized and reservoir water were used to dilute effluents from secondary and tertiary sewage treatment. The results indicate the following conclusions: (1) no differences exist between baseline and test samples; (2) response was greater in secondary than tertiary effluents; and (3) iron and trace elements appeared to stimulate slightly greater growth. Samples of various wash products were added to a solution of two percent test secondary effluent in reservoir water. The results showed no significant difference in maximum growth. It can be concluded that the addition of the wash products to treated sewage did not affect the bioassay response. (Holoman-Battelle)

PHYTOPLANKTON SUCCESSIONS AND LAKE DYNAMICS IN LAS VEGAS BAY, LAKE MEAD, NEVADA,
Nevada Univ., Reno.
E. R. Koenig, R. W. Tew, and J. E. Deacon.
J Ariz Acad Sci. Vol 7, No 3, p 109-112, 1972.
Identifiers: Bays, Currents, Density, Effluents, Industrial wastes, Lakes, *Nevada(Lake Mead), *Phytoplankton, Seasons, *Sewage effluents, Successions.

Phytoplankton successions, applications of the general growth equation and physical measurements were employed to investigate events occurring at the interface between industrial and sewage effluent contained in Las Vegas Wash and waters of Lake Mead, Nevada. The data indicate that the entering waters tend to form a density current interrupted at intervals by dynamic effects generated in the lake. The dynamic relationships described here for the spring months suggest that a much more thorough understanding of physical, chemical and biological interactions is necessary to permit solution of the numerous problems of Las Vegas Bay.--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF SODIUM-POTASSIUM CHLORIDE MINERAL WATER FROM THE SPLAIS SPRING (DRUSKININKAI HEALTH RESORT) ON THE PSEUDOCHOLINESTERASE ACTIVITY OF BLOOD SERUM AND PROTEIN-SYNTHESIZING FUNCTION OF THE LIVER IN EXPERIMENTAL ACUTE TOXIC HEPATITIS, (IN RUSSIAN),
K. A. Ambrashka.
Vopr Kurortol Fizioter Lech Fiz Kul't. Vol 37, No 2, p 154-160, 1972. Illus.
Identifiers: Acute toxicity, Blood serum, Chlorides, Cholin, *Health resorts, *Hepatitis, Liver, *Minerals, Potassium, Protein, Rats, Sodium, Springs, Water pollution effects, *USSR(Spalis spring), Salts.

The ingestion of water (containing NaCl, KCl and some SO_4^{2-} and Mg^{2+}) from the Spalis spring (USSR) shows therapeutic effects for acute toxic hepatitis in white rats. This is expressed by a more complete recovery of the impaired liver, and trend towards normalization of the pseudocholinesterase activity of the blood serum and the main indices of the protein-synthesizing func-

tion of the liver.--Copyright 1973, Biological Abstracts, Inc.

SYSTEMS ANALYSIS IN THE MARION LAKE IBP PROJECT,
British Columbia Univ., Vancouver.
C. J. Walters, and I. E. Efford.
Oecologia (Berl). Vol 11, No 1, p 33-44, 1972.
Identifiers: Biological studies, *Canada(Marion Lake-B.C.), Consumer, Density, Growth, Lakes, *Primary production, Season, *Systems analysis, IBP projects, Model studies, *Simulation analysis.

Modeling work in the Marion Lake Project (British Columbia, Canada) has led to a number of simulation models that trace the fate of primary production through consumer components of the lake ecosystem. Two of these models illustrate extremes in realism and generality: a simple compartment-flow system, and a detailed population model that represents density and individual growth of 24 major animal species. Both models are adequate to describe normal seasonal changes in the variables that they represent, but the simple model may give better predictions about response of the system to disturbance. Modeling efforts would have been much more successful if they had been initiated at the start of the project rather than after much field data were already collected.--Copyright 1973, Biological Abstracts, Inc.

DISTRIBUTION AND SEASONAL VARIATIONS OF THE PLANKTON IN 'RIVIERE DE MORLAIX,' (IN FRENCH),
G. Le Fevre-Lehoerff.
C R Hebd Seances Acad Sci Ser D Sci Nat. Vol 275, No 15, p 1681-1684, 1972. Illus.
Identifiers: Appendicularia, Brachyura, Chaetognatha, Cladocera, Copepoda, *Distribution, *France(Riviere de Morlaix), Mysidacea, *Plankton, Polychaeta, *Seasonal, Teleost, *Estuary, Tidal estuaries.

The 'Riviere de Morlaix,' a tidal estuary, is on the northern coast of Brittany (France). Monthly collected samples obtained during neap low tide at 9 points made it possible to determine the major zooplanktonic groups represented in the estuary, the homogeneity or heterogeneity of distribution of the main species, and the amplitude of their seasonal variations. The most representative groups involve the holoplanktonic Crustacea, Copepoda (Acartiidae, Centropagidae), Cladocera, Mysidacea, as well as the Appendicularia and the Chaetognatha. As for the meroplankton, it is represented by larvae of Polychaeta and Brachyura, and eggs and larva of Teleostei. A description is given of the zones, nature of the bottom, temperature, salinity, and trophic relations.--Copyright, 1973, Biological Abstracts, Inc

CORRELATION BETWEEN CO2 AND O2 CONCENTRATIONS IN LAKE ERIE, USA,
State Univ. Coll., Fredonia, N.Y.
K. G. Wood, and J. Verduin.
Arch Hydrobiol. Vol 71, No 1, p 1-16. 1972. Illus.
Identifiers: *Anaerobic conditions, *Carbon dioxide, Lakes, *Oxygen, Respiration, *Lake Erie, Hypolimnion.

Oxygen (O2) concentration was correlated with total carbon dioxide (CO2) concentration, both variables reported as the micro moles/l difference from air equilibrium. CO2 deficits were not associated with corresponding O2 supersaturation, but O2 deficits were associated with corresponding O2 excess, mole for mole. However the hypolimnion of the central basin of Lake Erie showed as much as 30% greater CO2 excess than O2 deficit during late Aug. when dissolved O2 values approached zero. These values suggest a significant anaerobic respiration contribution. New equations are provided for studies of carbonate equilibria. The differential titration method for estimation of biological productivity is discussed.--Copyright 1973, Biological Abstracts, Inc.

BALANTIDIASIS OUTBREAK IN TRUK,
P. D. Walzer, F. N. Judson, K. B. Murphy, G. R. Healy, and D. K. English.
Am J Trop Med Hyg. Vol 22, No 1, p 33-41. 1973. Illus.
Identifiers: *Balantidiasis, *Caroline Islands(Truk), *Epidemics(Human), Islands, Typhoons, *Animal wastes(Pigs), Water pollution effects.

In May and June 1971, an epidemic of balantidiasis involving 110 persons occurred on Truk, Caroline Islands following a devastating typhoon on 1 May. The disease was mild, self-limited, and lacked distinguishing clinical features. The outbreak was multifocal in origin, occurred in all age groups and with equal sex distribution, and terminated spontaneously by early July. The people of Truk live on close association with pigs, and the epidemic probably resulted from widespread contamination by pig feces of ground and surface water supplies, which the people were forced to use after their catchment systems were destroyed by the typhoon.--Copyright 1973, Biological Abstracts, Inc.

AN EPIDEMIOLOGICAL STUDY ON CLONORCHIASIS IN KYOTO CITY, (IN JAPANESE),
Kyoto Prefectural Univ. of Medicine (Japan). Dept. of Medical Zoology.
M. Nagahana, K. Matsuno, M. Iwaki, K. Oda, and A. Yamaguchi.
Jap J Parasitol. Vol 21, No 3, p 143-149. 1972. English summary.
Identifiers: *Clonorchiasis, Clonorchis-Sinensis, Dogs, *Epidemiology, Fish, Human diseases, *Japan(Kyoto City), Parafossarulus-Manchouricus, Rats, Waterways, *Cities, Water pollution effects.

Two waterways flow through Kyoto prefecture from Lake Biwa in Shiga prefecture. 1 of the epidemic areas of clonorchiasis in Japan. One is the River Uji, and the other is the Kyoto drainage canal flowing through Kyoto City. The present study was conducted from 1968-1969. The construction work of this canal was finished in 1912 before Muto found and determined the first intermediate host, Parafossarulus manchouricus at the lake side of Biwa in 1918. Although Kawamura and Hirase had already described the finding of the snail in this canal before 1919 (Muto, 1918), there was no systematic survey of clonorchiasis in and/or around this canal. Even today, this canal is utilized for electrification and water service for Kyoto citizens. This canal also is utilized for fishing during all seasons and for swimming in summer. In a survey along the whole canal (about 24 km), the snail was found at 6 stations. An examination on the metaceriae of C. sinensis in fishes caught in the canal where the snail was found, showed many fishes positive for the metacercariae. In the case of P. parva, 13 of 18 fishes (72.2%) were positive for the metacercariae of C. sinensis. Examinations for C. sinensis in final hosts (dogs and house rats) were performed at an area near the canal. Two of 38 dogs (5.3%) were positive for C. sinensis eggs, and 4 of 30 house rats (13.3%) were infected with adult worms of C. sinensis. Kyoto city includes an epidemic areas of clonorchiasis although not on a large scale.--Copyright 1973, Biological Abstracts, Inc.

5D. Waste Treatment Processes

INTERMITTENT SAND FILTRATION TO UPGRADE EXISTING WASTEWATER TREATMENT FACILITIES,
Utah Center for Water Resources Research, Logan.
G. R. Marshall, and E. J. Middlebrooks.
Available from the National Technical Information Service as PB-231 205; $7.25 in paper copy, $1.45 in microfiche. Utah Water Research Publication PRJEW115-2. February 1974. 80 p, 26 fig, 34 tab, 40 ref. OWRR A-015-UTAH(1). 14-01-0001-3845.

Descriptors: *Filtration, *Waste water treatment, *Oxidation lagoons, *Tertiary treatment, Water quality standards, Algae, Pilot plant, Temperature, Treatment facilities, Effluents.
Identifiers: Intermittent sand filters, Slow sand filters, *Algae removal, Effluent polishing, *Sand filters.

Laboratory and field scale intermittent sand filtration of wastewater lagoon effluents was found to be a promising and economically feasible means of upgrading wastewater effluents to meet more stringent water quality standards of today. While the process was found to be very efficient at oxidizing applied nitrogen compounds, it was also found to be inefficient at removing applied phosphorus compounds. The process was found to

be capable of removing appreciable amounts of applied algae, still some algae were found to pass the entire filter depth. When operating under applied BOD concentrations typical in a properly operated secondary biological treatment plant effluent, the process was found to consistently meet present Utah Class 'C' water quality standards for BOD (equal to or less than 5 mg/1). Very high total coliform removal efficiency was exhibited by the process of intermittent sand filtration. The number of consecutive days of operation before cleaning was required was found to be related to the hydraulic loading rate and the filter influent suspended solids concentration. It was estimated that an effluent polishing intermittent sand filter process can be constructed and operated at a cost ranging from $15 to $47 per million gallons of filtrate.

UTILIZATION OF TRICKLING FILTERS FOR DUAL TREATMENT OF DRY AND WET WEATHER FLOWS,
Killam (Elson T.) Associates, Inc., Milburn, N. J.
P. Homack, K. Zippler, and E. Herkert.
Copy Available from GPO Sup Doc as EP1.23:670/2-73-071, $1.50; microfiche from NTIS as PB-231 251, $1.45. Environmental Protection Agency, Technology Series, Report EPA-670/2-73-071, September 1973. 118 p, 28 fig, 39 tab. EPA Project 11020 FAN.

Descriptors: *Trickling filters, *Filtration, *Waste water treatment, Rocks, Infiltration, Control, Treatment, Dual purpose, Dry seasons, Wet seasons, *New Jersey, *Sewage treatment.
Identifiers: *Dual treatment, New Providence(NJ).

A trickling filter sewage treatment plant was designed and constructed in the Borough of New Providence, New Jersey to alleviate local sewage treatment plant hydraulic overloading and resultant loss of treatment efficiency caused by excessive infiltration. The Plant utilizes two high rate trickling filters, one with rock media, the other with plastic media, operating in parallel to treat wet weather flow. During dry weather periods the plant is operated in series with a controlled flow to maintain an active biological slime on the filters. The plant also consists of a primary clarifier-leveling reservoir, secondary clarifier and chlorine contact tank. No sludge handling facilities are provided. A study of plant efficiency for one year indicated that during dry weather controlled flow operation, the BOD and suspended solids removal efficiency varied from 85 to 90 per cent. When operated during wet weather, the BOD and suspended solids removal efficiency varied from 56 to 74 percent. The plastic media trickling filter was found to remove more BOD per unit volume than the rock media trickling filter, under both dry and wet weather flow conditions. This investigation has shown that it is both technically feasible and economical to design, construct and operate a treatment plant to process both the controlled dry weather and the higher flows encountered during periods of excessive infiltration using a combination of series-parallel high rate trickling filters. PHYSICAL-CHEMICAL TREATMENT OF RAW MUNICIPAL WASTEWATER,
District of Columbia Dept. of Environmental Services, Washington.
D. F. Bishop, T. P. O'Farrell, A. F. Cassel, and A. P. Pinto.
Copy Available from GPO Sup Doc as EP1.23:670/2-73-070, $1.05; microfiche from NTIS as PB-231 250, $1.45. Environmental Protection Agency, Technology Series Report EPA-670/2-73-070, September 1973. 60 p, 13 fig, 16 tab, 30 ref. EPA Project 11010 EYM. 14-12-818.

Descriptors: *Waste water treatment, Anaerobic conditions, *Filtration, *Adsorption, *Ion exchange, *District of Columbia, Biochemical oxygen demand, Calcium carbonate, Chemical oxygen demand, Colloids, Ammonia organic loading, *Flocculation, Phosphorus, Nitrogen, Lime, Sedimentation.
Identifiers: *Physical-chemical treatment, Lime clarification, *Municipal wastewater, Carbon adsorption, Breakpoint chlorination, Recarbonation.

Physical-chemical treatment of raw wastewater consisted of two-stage lime clarification with intermediate recarbonation, filtration, pH control, ion exchange or breakpoint chlorination, and adsorption. Lime treatment with approximately 300 mg/l of CaO increased the wastewater pH to 11.5 and removed 96% of the phosphorus and 80% of the organics. In the second stage, recarbonation with 120 mg/l of CO2 and mineral addition of 5 mg/l of Fe+++ reduced the pH to 10.0 and precipitaed excess Ca++ as CaCO3. Dual media filtration decreased effluent suspended solids and total phosphorus to less than 5 mg/l and 0.15 mg/l as P, respectively. Addition of 10 mg/l chlorine to the filter influent controlled biological growth within the filter and produced filter runs of greater than 50 hours. With extensive operator surveillance, the clinoptilolite exchange media reduced the NH3 to less than 1 mg/l as NH+4-N. Breakpoint chlorination oxidized the NH3 to N2, leaving a residual NH3-N concentration of less than 0.4 mg/l. The 20 mg/l of soluble BOD entering the granular carbon columns prodiced anaerobic biological growth on the carbon, which contributed to heavy H2S production and high carbon losses during backwash. Breakpoint chlorination ahead of carbon adsorption minimized biological activity. The complete physical-chemical system, with ion exchange, removed 98% of the phosphorus, 95% of the organics (COD) and 78% of the total nitrogen. With breakpoint chlorination, the complete system removed 98% of the phosphorus, 94% of the organics (COD) and 86% of the total nitrogen. (Kisenbauer-EPA)

TECHNICAL AND ECONOMIC EVALUATION OF COOLING SYSTEM BLOWDOWN CONTROL TECHNIQUES,
Wapora, Inc., Washington, D.C.
D. B. Boies, J. E. Levin, and D. Baratz.
Copy available from GPO Sup Doc as EP1.23:660/2-73-026, $1.20; microfiche from NTIS as PB-231 258, $1.45. Environmental Protection Agency, Technology Series Report EPA-660/2-73-026, November 1973. 73 p, 13 fig, 11 tab. PE B12036, ROAP 16ACQ Task 11. 68-03-0233.

Descriptors: *Cooling towers, Cooling water, *Control systems, *Waste water treatment, Automatic control, Instrumentation, Management, Water pollution treatment, Treatment facilities, Recycling.
Identifiers: *Cooling system blowdown.

Methods are described which are either currently applied or commercially available to reduce the pollution impact of blowdown from large cooling systems (recirculating rates greater than 500 cfs). Treatment equipment descriptions, capabilities and compatibilities are discussed. Where appropriate, broad ranges of both capital costs and operating expenses are provided. The described methods include (a) the application and design of closed-cycle cooling systems, (b) makeup water treatment, (c) recirculating water treatment, (d) mechanical treatment, and (e) blowdown treatment and/or disposal. (EPA)
W74-06510

PACKINGHOUSE WASTE TREATMENT.
Stockton Dept. of Public Works, Calif.
Available from the National Technical Information Service as PB-231 976; $15.25 in paper copy, $1.45 in microfiche. Environmental Protection Agency Report, (April 1970). 238 p, 34 fig, 45 tab. EPA Project 11060 DRT.

Descriptors: *Aeration, *Activated sludge, *Food processing industry, *Waste water treatment, Biological treatment, Corrosion control, Sampling, Sewage, Sewers.
Identifiers: *Meat packing wastewater, U-Tube aeration, *In-Sewer treatment, Sewer gases, Pretreatment.

The feasibility to demonstrate pretreatment of packinghouse wastewaters was investigated in the laboratory. The pretreatment consisted of a Kehr activated sludge process in conjunction with in-sewer treatment. Laboratory tests were designed to study the oxygen uptake, contact time, potential foaming and scum problems, flow characteristics, odors, BOD removal efficiency, clarification, and return of activated sludge of high suspended solids mixed liquor reactors using packinghouse wastes. Sampling and analysis of the sewer flow and gases generated, along with work on in-sewer treatment and corrosion protection evaluated as part of the pretreatment process. Main water quality control plant description and operations were given along with the results of an extensive sewage sampling program. An economic analysis was made of the different pretreatment processes and of central treatment. Pretreatment of the waste was shown to be economically desirable. (Scaief-EPA)
W74-06511

AN APPRAISAL OF NEUTRALIZATION PROCESSES TO TREAT COAL MINE DRAINAGE,
Pennsylvania State Univ., University Park. Coll. of Earth and Mineral Sciences.
H. L. Lovell.
Copy available from GPO Sup Doc as EP1.23:670/2-73-093, $3.50; microfiche from NTIS as PB-231 249, $1.45. Environmental Protection Agency, Technology Series Report EPA-670/2-73-093, November 1973. 347 p, 65 fig, 66 tab, 100 ref. Partly sponsored by Pennsylvania Dept. of Environmental Resources. EPA Project 14010 EFN.

Descriptors: *Coal mine acids, *Neutralization, *Waste water treatment, Operation and maintenance, *Sludge, Treatment facilities, *Separation techniques, Bacteria, Dewatering, Disposal, Capital costs, Operating costs, *Oxidation, Water quality, *Pennsylvania.
Identifiers: Treatment processes, Autotrophic bacteria, Alkaline reagents, Hollywood(Penn).

Four different quality drainages were treated and detailed results tabulated. Appropriate unit operations, from water collection to sludge disposal were considered for eight different reagents (calcium/magnesium carbonate, oxide and hydroxide; caustic soda and soda ash). Necessary process variations were possible with a versatile 500,000 gpd facility. Limestone has the least cost per neutralization equivalent and may be used with drainage containing up to 500 mg/l iron II. The resulting sludge is dense, rapid settling and dewaterable. Lime can treat any drainage efficiently but may result in excess consumption. Lime-produced sludges are voluminous and difficult to handle. Unitized sludge recycle process, using lime, forms a dense, dewaterable sludge. Iron II oxidation was accomplished by air in alkaline systems or with autotrophic bacteria in acid system. Thickeners are preferred to settling lagoons to separate sludge in larger plants. Dewatered sludge requires least disposal volume. Drying basin dewatering is pragmatic, but filtration or centrifugation are effective, but more costly. Settled sludge may be discarded directly to abandoned deep or surface mines; while dewatered sludge may be placed in landfill areas. (EPA)
W74-06512

TREATMENT OF DOMESTIC WASTEWATER AND NSSC PULP AND PAPER MILL WASTES,
Harriman Utility Board, Tenn.
P. J. Farrell, L. R. Heble, and A. G. Steuhser.
Copy available from GPO Sup Doc as EP1.23:660/2-73-010 $1.40; microfiche from NTIS as PB-231 267, $1.45. Environmental Protection Agency, Technology Series Report EPA-660/2-73-010, December 1973. 104 p, 32 fig, 21 tab, 7 ref. EPA Project 12130 DBF.

Descriptors: *Domestic wastes, *Waste water treatment, Sulfites, *Pulp wastes, *Aeration, Disinfection, *Filtration, Color, Organic wastes, Solid wastes, Biochemical oxygen demand.
Identifiers: *Joint treatment, Organics removal, Color removal, Primary clarification, Extended aeration, Final clarification, Biofiltration.

The Harriman Utility Board and the Mead Corporation made a study of the joint treatment of primary clarified domestic waste and neutral sulfite semichemical (NSSC) pulp and paper mill wastes. A pilot plant was constructed and operated from April, 1971 through March, 1972. The most effective treatment scheme consisted of a biofilter (used as a roughing filter) and an extended aeration. Color reduction was accomplished by massive lime and chlorine additions due to the color's dependency on pH. Disinfection was optimum when ammonia was mixed with the combined wastes prior to chlorination. The biofilter's BOD removal efficiency ranged from 3 to 45 percent. Extended aeration's BOD removal efficiency ranged from 24 to 98 percent. (EPA)
W74-06513

RECOVERY OF FATTY MATERIALS FROM EDIBLE OIL REFINERY EFFLUENTS,
Swift and Co., Oak Brook, Ill. Research and Development Center.
W. C. Seng.
Copy available from GPO Sup Doc as EP1.23:660/2-73-015, $1.60; microfiche from NTIS as PB-231 268, $1.45. Environmental Protection Agency, Technology Series Report EPA-660/2-73-015, December 1973. 148 p, 27 fig, 27 tab, 4 ref. EPA Project 12060 DQV.

Descriptors: Treatment facilities, *Industrial wastes, *Waste water treatment, *Oil wastes, Polymers, *Flocculation, *Centrifugation, Market value, *Byproducts, Cathodic protection, Water pollution sources, Coagulation, Rectifiers, Biological oxygen demand, Suspended solids, Anodes, Anions, Cathodes, Cations, Water pollution, Turbidity, Zeta potential, Flotation, *Operating costs, Laboratory tests, Instrumentation, Corrosion control, *Illinois.
Identifiers: *Fatty wastes, Electro-coagulation, pH control, Hexane solubles, Edible fats, Edible oils, Bradley(Ill).

New full scale equipment was added to existing standard waste treatment equipment at the Swift and Company Edible Oil Refinery at Bradley, Illinois. Synthetic acrylamide polymer flocculants with alum, and impressed current, were evaluated for removal of fatty materials from the plant waste water. An in-plant waste water survey was made. A DeLaval PX-213 bowl opening, disc stack centrifuge was successfully tested to concentrate the removed fatty material after caustic and sulfuric acid treatment. The 7000 pounds daily of recovered oil (98% ether soluble), worth 4-1/4 to 4-5/8 cents per pound, could offset 60% of the total waste treatment direct operating costs. (EPA)
W74-06514

A DESIGN AND ECONOMIC EVALUATION OF CATALYTIC OXIDATION OF PHENOLS IN WASTEWATER,
Delaware Univ., Newark.
H. H. Ficke.
Available from the National Technical Information Service as PB-231 220; $7.75 in paper copy, $1.45 in microfiche. Delaware Water Resources Center, Newark Research Report, May 1973. 76 p, 5 fig, 5 tab, 31 ref, 5 append. OWRR A-14-DEL (4).

Descriptors: *Waste water treatment, *Phenols, *Oxidation, Catalysts, Chemical reactions, Design, Evaluation, *Cost analysis.
Identifiers: *Catalytic oxidation.

Catalytic oxidation is a possible process for treating wastewater effluents containing phenol from catalytic cracking units and coal tar plants. Experimental data were collected to determine intrinsic rate constants for phenol oxidation to CO2 and water. These constants were used in the design and optimization of a proposed process. Total cost for 99% reduction of phenol from 1000 gallons of wastewater (700 ppm) from the catalytic cracker was $0.35. Total cost per 1000 gallons (4000 ppm) from coal tar was $0.60. (Knapp-USGS)
W74-06516

DEMONSTRATION OF A NON-AQUEOUS SEWAGE DISPOSAL SYSTEM,
Black Hills Conservancy Sub-District, Rapid City, S.Dak.
F. L. Matthew, and E. E. Nesheim.
Copy available from GPO Sup Doc as EP1.23:670/2-73-088, $1.60; microfiche from NTIS as PB-231 338, $1.45. Environmental Protection Agency, Technology Series Report EPA-670/2-73-088, December 1973. 131 p, 7 fig, 20 tab, 2 ref. EPA Project 15010 PBK.

Descriptors: *Waste water treatment, *Water reuse, Water pollution control, Operating costs, *Recreation facilities, *Sewage treatment, *South Dakota.
Identifiers: *Chemical treatment, Recirculating systems, Watercraft wastes, *Mount Rushmore(So. Dak).

A prototype non-aqueous wastewater treatment system utilizing recirculated mineral oil as a collection and transport media was installed and operated at the Mount Rushmore National Memorial, Rapid City, South Dakota. The project was conducted to demonstrate the feasibility and effectiveness of the non-aqueous system for application at recreational and similarly remote areas. The non-aqueous system was evaluated for six months during the 1972 visitation season. During this period, data were collected to determine system usage rate and user waste loading and for the evaluation of the physical, biological, and chemical content of the flush oil as a function of system usage. System operation and reliability were also demonstrated during the test period. The demonstration showed that the non-aqueous treatment system is effective in the collection, transport, and disposal of human waste. Odors in the oil flush media and from the treatment system presented an aesthetic problem which makes the use of this system undesirable for recreational areas such as Rushmore. System redesign to prevent organic accumulations and the routine use of an oxidizer-bactericide to eliminate odor-producing bacterial activity is required before this concept can be suitable for high-use visible recreational areas. Water conservation is achieved when recirculated mineral oil is used to collect and transport human wastes. The waste volume is reduced by 98 percent in comparison with conventional water carriage systems. (EPA)

Copy available from GPO Sup Doc as EP1.23:660/2-73-028 for $2.75; microfiche from NTIS as PB-231 259 for $1.45. Environmental Protection Agency, Technology Series EPA-660/2-73-028, December 1973. 280 p, 47 fig, 75 tab, 15 ref. EPA Project 12040 GQD.

Descriptors: *Tertiary treatment, *Waste water treatment, *Coliforms, *Pulp wastes, *Disinfection, *Toxicity, *Chlorination, Bioassay, Chemical analysis, Microorganisms, Biochemical oxygen demand, Sulfite liquors, Salmonids, *Oregon, Water quality standards.
Identifiers: Ammonia base, Chloramines, Prosthecate bacteria, Sanitary survey, South Santiam River(Ore), Lebanon(Ore).

Secondary effluent from an ammonia base sulfite mill in Lebanon, Oregon, increased concentrations of coliforms (total coliform bacteria) in receiving waters to more than 1000 per 100 ml, the State standard. Factors responsible for high coliform populations were determined and a disinfection method was developed for reducing their numbers in secondary effluent. Chlorination was often ineffective. However, by injecting NaOH into the chlorinator's water supply, adequate coliform kill was achieved with approximately 5.7 ppm chlorine and 3.3 ppm NaOH. Continuous chlorination affected a reduction in coliforms in receiving waters to acceptable levels and the chlorinated effluent had a low degree of toxicity to salmonid fingerlings. (EPA)

COLOR REMOVAL FROM KRAFT MILL EFFLUENTS BY ULTRAFILTRATION,
Champion International Corp., Hamilton, Ohio
H. A. Fremont, D. C. Tate, and R. L. Goldsmith.
Copy available from GPO Sup Doc as EP1.23:660/2-73-019, $2.40; microfiche from NTIS as PB $1.45. Environmental Protection Agency, Technology Series Report EPA-660/2-73-019, December 1973. 240 p, 58 fig, 35 tab. EPA Project S 800-261.

Descriptors: Pulp and Paper industry, Effluents, *Waste water treatment, Pilot plants, Cost analysis, *Pulp wastes, *Filtration, Membrane processes, Organic wastes, Reverse osmosis, Color, Operation and maintenance, Incineration, *Water reuse, *North Carolina, Recycling.
Identifiers: *Ultrafiltration Process, Waste water recycle, *Color removal, Organic removal, Bleach caustic extraction effluent, Kraft Decker effluent, Canton(N.C.).

The purpose was to examine ultrafiltration as a means of reducing color in kraft mill effluents more efficiently and/or more economically than the presently available method. The program included the six month operation of a 10,000 gpd pilot plant at the Champion Papers' Canton, North Carolina, pulp and paper mill. The major experimental effort dealt with treatment of pine bleaching caustic extraction filtrate with lesser emphasis on unbleached pine and hardwood pulp washing Decker effluents. Four experimental aspects of the process were evaluated: feed pretreatment, ultrafiltration, concentrate disposal and water reuse potential. The process color removal efficiency was satisfactory. For all influent studied typical results were 90% color removal with 98.5-99% water recovery. The total operating costs, including amortization and exclusive of credits for a one million gallon per day treatment plant are estimated to be $0.58/tons bleached pulp for pine caustic extraction filtrate influent and $0.33/ton total pulp for Decker effluents as influent. INVESTIGATION OF TREATING ELECTROPLATERS CYANIDE WASTE BY ELECTRODIALYSIS,
RAI Research Corp., Long Island City, N.Y.
S. B. Tuwiner.
Copy available from GPO Sup Doc as EP1.23/2:73-287, $0.90; microfiche from NTIS as PB-231263 $1.45. Environmental Protection Agen-

cy Technology Series Report EPA-R2-73-287, December 1973. 48 p, 2 fig, 2 tab, 21 ref. EPA Project 12010 DFS.

Descriptors: Effluents, Industrial wastes, Membrane processes, *Dialysis, Separation techniques, Liquid wastes, *Electro-osmosis, Ion transport, *Waste water treatment.
Identifiers: *Cyanide, *Electroplating, *Electrodialysis.

An electrodialysis procedure is developed whereby the discharge of rinsewater is eliminated. The work, according to this method, is rinsed in a sequence of two rinses; the final rinse contains a concentration of cyanide of 1/10,000 of that of the plating. These concentrations are maintained by the use of electrodialysis to transport cyanides continuously from the second rinse solution back to the first rinse solution and also from the first rinse back to the plating bath. In this way, all cyanide is recovered and returned to the bath. Design parameters are determined from the experiments and costs are estimated. The experimental system used was a prototype of a commercial size electrodialysis unit operated continuously under conditions which simulated those of the projected two-stage commercial system using a cyanide copper plating bath. TERTIARY TREATMENT WITH A CONTROLLED ECOLOGICAL SYSTEM.
Las Virgenes Municipal Water District, Calabasas, Calif.
Copy available from GPO Sup Doc as EP1.23:660/2-73-022 $0.90; microfiche from NTIS as PB-231261 $1.45. Environmental Protection Agency Technology Series Report EPA-660/2-73-022, December 1973. 43 p, 21 fig, 6 tab, 3 ref. EPA Project 16080 FBH.

Descriptors: *Waste water treatment, Water reclamation, Aquatic biology, *Tertiary treatment, Oxidation lagoons, Zooplankton, Ecosystems, *Daphnia, *Algae, Water pollution control.
Identifiers: Biological processes, Polishing(Treatment).

A two-stage pond system was operated as a process for polishing secondary sewage effluent. The shallow first stage was an oxidation pond in which a heavy growth of algae was permitted to develope. In the second stage a population of Daphnia pulex consumed the algae. Detention times were about 10 days in each stage. Chemical and biological monitoring were carried out over a year's period to determine feasibility of using the process to produce recreational-grade water and reduce algae growth potential. While the Daphnia remained as the dominant zooplankton species in the second pond throughout the observation period, their concentration varied between 100 and 1,500 organisms/liter. Excellent water clarity was obtained when the Daphnia were above 500 organisms/liter, and at such times the over-all COD reduction was greater than 40 percent. Significant removal of nutrients occurred only during the months of July and August, when N and P reductions were 48 percent and 63 percent respectively. Performance was hampered by occasional invasions of Dephnia or rotifers in the first-stage pond, which decimated the algae. Such events were not successfully controlled and remain the principal obstacle to further process development. (EPA)

HYPOLIMNION AERATION WITH COMMERCIAL OXYGEN - VOL. I - DYNAMICS OF BUBBLE PLUME,
Texas Univ., Austin.
R. E. Speece, F. Rayyan, and G. Murfee.
Copy available from GPO Sup Doc as EP1.23:660/2-73-025a, $2.00; microfiche from NTIS as PB $1.45. Environmental Protection Agency, Technology Series Report EPA-660/2-73-025a, December 1973. 184 p, 86 fig, 7 tab, 47 ref. EPA Project 16080 FYW.

Descriptors: Water quality, *Hypolimnion, *Aeration, Stratification, Water quality control, *Texas, *Oxygenation, *Bubbles, Model studies, Dissolved oxygen, Absorption.
Identifiers: *Lake Travis(Tex.), Bubble plumes.

This study deals with a proposed scheme for restoration and maintenance of dissolved oxygen in the hypolimnion of stratified impoundments without disturbing the stratification. Commercial oxygen is an economical alternative to air as an oxygen source for hypolimnion aeration. In addition, it possesses many other advantages, the main one being avoidance of nitrogen gas supersaturation and its related toxicity to fish. Laboratory and lake studies were conducted to demonstrate the gas transfer dynamics of a bubble plume generated by the injection of pure oxygen bubbles within the hypolimnion. The experimental results verified the practicality of the original concept-hypolimnion aeration which preserves stratification. Efficient oxygen absorption was achieved within the hypolimnion. Mathematical models were formulated and calibrated by experimental data. The calibrated model was then used to predict the oxygen transfer and hydrodynamic characteristics of the bubble plume for various oxygen injection rates and injection depths. The sensitivity of the model to the various input parameters was shown. (See also W74-66526) (EPA)

EMERGENCY PLANNING FOR MUNICIPAL WASTEWATER TREATMENT FACILITIES,
Wiley and Wilson, Inc., Lynchburg, Va.
R. A. Lemon, R. L. Green, and G. L. Page, Jr.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Price $1.25. Environmental Protection Agency, Washington, D.C. Office of Water Program Operations, Report EPA-430/9-74-013, February 1974. 78 p, 7 fig, 40 ref. EPA Contract 68-01-0341.

Descriptors: *Disasters, *Waste water Treatment, *Treatment facilities, *Water pollution control, *Planning, Earthquakes, Floods, Storms, Tornadoes, Tropical cyclones, Tsunami, Acts of God, Damages, Hazards, Negligence, Warning systems, Winds, Hurricanes, Electric power failure, Failures, Sewage effluent.
Identifiers: Emergencies, Preparedness, Municipal spills, Overflows, Plant operation, and Accidents.

A study has been made of emergency planning for municipal wastewater treatment facilities to insure effective continued operation under energency conditions. These emergency conditions could be imposed by natural disasters, civil disorders, strikes, faulty maintenance, negligent operation, or accidents. Over 200 municipal treatment systems were contacted and asked to provide information for this project. This information was used to help identify the principal causes of failures within municipal treatment systems. Information on emergency planning and responses to emergency conditions was provided from these contacts. The results of this study are presented in the form of a manual for the development of emergency operating plans for municipal wastewater treatment systems. The intent is to expand the concepts stated in the Federal Control Act Amendments of 1972. (EPA)

START-UP OF MUNICIPAL WASTEWATER TREATMENT FACILITIES,
Wiley and Wilson, Inc., Lynchburg, Va.
R. D. Rader, R. L. Green, and G. L. Page, Jr.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402 Price $1.40. Environmental Protection Agency, Washington, D.C. Office of Water Pro-

gram Operation, Report EPA-43019-74-008, December 1973. 92 p, 3 fig, 2 tab, 42 ref. EPA Contract 68-01-0341.

Descriptors: *Administrative decisions, *Treatment facilities, *Waste water treatment, *Operations, *Laboratory tests, *Sampling, Testing, Analysis, Controls, Activated sludge, Trickling filter, Oxidation lagoons, Anaerobic digestion, Safety, Chlorination, Suspended solids, Hydrogen ion concentration, Alkalinity, Biochemical oxygen demand, Chemical oxygen demand, Pre-treatment(Water), Sewage treatment.
Identifiers: Procedures, Process, Seed sludge, Staffing, Standard operating procedures, Site meetings, Inventory inspection pretestin, Operator training, Settleable solids, Total solids, Volatile solids, Volatile acids, Mixed liquor suspended solids.

This manual provides guidance for putting into initial operation municipal wastewater treatment plant, a new addition to an existing treatment plant, or a change in the mode of the treatment plant's operation so that the treatment plant or process will effectively treat the wastewater in compliance with the specific conditions and limitations established for treatment facility. The manual was developed and prepared with the aid and cooperation of wastewater treatment plant operators and superintendents, start-up experts, the academic community, manufacturers and suppliers of wastewater treatment plant equipment, and literature review of wastewater treatment plant operations and recognized start-up techniques. Information is provided on preparing for actual treatment plant start-up. Preparations for start-up include: staffing the plant, developing standard operating procedures, dry- and wet-run testing of equipment, on-site operator training, safety, and establishing procedures when construction is continuing during start-up. This manual describes start-up procedures for some of the more common pretreatment and primary treatment units; for the specific secondary treatment processes of activated sludge, trickling fileters, stablization ponds and aerated lagoons; and for the sludge handling units and the anaerobic digestion process. The start-up procedures for advanced wastewater treatment units and processes are not considered in this manual. (EPA)

MAINTENANCE MANAGEMENT SYSTEMS FOR MUNICIPAL WASTEWATER FACILITIES,
Wiley and Wilson, Inc., Lynchburg, Va.
J. J. Jennings, Jr., W. M. Johnson, G. L. Page, Jr., W. H. Clingenpeel, and R. L. Green.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402 Price $1.60. Environmental Protection Agency, Washington, D.C. Office of Water Program Operations, Report EPA-430/9-74-004, October 1973. 118 p, 29 fig, 188 ref. EPA Contract 68-01-0341.

Descriptors: *Treatment facilities, *Operation and maintenance, *Municipal wastes, Publications, *Wastewater treatment, Costs, Personnel, Maintenance, *Management, *Operating costs.

This manual has been prepared by the Environmental Protection Agency to provide guidelines to aid plant management in selecting, instituting, and evaluating various maintenance management systems for municipal wastewater treatment plants. The principal background for this work came from the existing maintenance guidelines as outlined in 'Federal Guidelines for Design, Operation and Maintenance of Wastewater Treatment Facilities' as provided by the Environmental Protection Agency. A survey of existing maintenance management systems used by wastewater treatment facilities, industries, and the armed forces were reviewed and input was obtained from persons experienced in maintenance management. This manual includes a separate section on each of the basic features required in a sound maintenance management system. Detailed discussions of the basic features with information on how to establish and implement the system are included. Three examples are provided to aid persons in combining the features into a sound system. The examples are not intended as a rigid format but can be modified to fit the particular plant's requirements. (EPA)

NITROGEN ELIMINATION BY BOGUS ALTERNATION OF AEROBIC/'ANOXIC' CONDITIONS IN 'ORBAL' ACTIVATED SLUDGE PLANTS,
National Inst. for Water Research, Pretoria (South Africa).
R. J. L. C. Drews, and A. M. Greeff.
Water Research, Vol 7, p 1183-1194, 1973. 5 fig, 4 tab, 13 ref.

Descriptors: *Sewage treatment, *Denitrification, *Activated sludge, *Aeration, Pilot plants, Sludge treatment, *Waste water treatment, Nitrogen, Treatment facilities, Ammonia, Aerobic conditions.
Identifiers: Extended aeration, South Africa.

Methods of operation for obtaining maximum nitrogen elimination in the 'Orbal' endless channel extended aeration plant were compared. The most efficient method required balancing of sludge concentration, organic load and oxygen input against one another in such a way that a rapid alternation of aerobic/anoxic conditions was brought about between aeration points in each channel. This resulted in minimal amounts of ammonia and nitrate remaining in the effluent. Automated control of oxygen input and of sludge concentration is considered necessary for consistent maximum nitrogen removal. (DWA)

ECOLOGICAL AND PHYSIOLOGICAL IMPLICATIONS OF GREENBELT IRRIGATION,
California Univ., Riverside. Dept. of Plant Sciences.
V. B. Youngner, and T. E. Williams.
Available from the National Technical Information Service as PB-231 376, $4.50 in paper copy, $1.45 in microfiche. California Water Resources Center, Davis, Contribution No. 145, Technical Completion Report (California Project UCAL-WRC-W-374), 1973. 105 p, 14 fig, 22 tab, 74 ref. OWRR B-158-CAL(1).

Descriptors: *Recirculated water, Irrigation systems, Vegetation effects, Fires, *California, *Return flow, *Water reuse, Waste water disposal, Multiple-purpose project, Water pollution sources.
Identifiers: *Maloney Canyon(Calif), *Greenbelts.

The uncontrolled influx of permanent residents into the seasonally dry mountain areas of southern California has compounded fire hazards and created serious deficiencies in water supply and waste disposal systems of mountain communities. The problem has necessitated the conservation of existing water supplies through the maximum use and reuse of potable and wastewater sources. This need for a recycling of water led to a consideration of wastewater reclamation by a multi-purpose terrestrial disposal system, and the construction, in 1970, of the Maloney Canyon Greenbelt Irrigation Project. The project was designed to examine the feasibility of an effluent-irrigated chaparral ecosystem as a greenbelt fuel break for fire prevention, and to serve as a renovation system for wastewater recycling. An expanded water monitoring program encompassing analyses of surface and ground waters was implemented as an indicator of areas of wastewater contaminant accumulation. Soils and plants were analyzed for nutrient removal characteristics and patterns of native and introduced vegetation survival and growth were correlated into a feasible design for an effective greenbelt vegetation system. Results appear to be favorable to the project objectives of wastewater renovation and fire suppression through greenbelt establishment. (Snyder-California at Davis)

1972 OPERATION OF THE ICPP RARE GAS RECOVERY FACILITY,
Allied Chemical Corp., Idaho Falls, Idaho. Idaho Chemical Programs Operations Office.
C. L. Bendixsen, F. O. German, and R. R. Hammer.
Available from the National Technical Information Service, Springfield, Va., as ICP-1023; $4.00 per copy, $1.45 microfiche. Report No. ICP-1023, March 1973. 24 p, 1 fig, 4 tab, 2 ref.

Descriptors: Operations, Fuels, Effluents, *Krypton radioisotopes, *Xenon, Gases, *Radioactivity, Control system, Cryogenic, Distillation, Retention, Evaluation, Safety, Public health, Fallout, Water pollution sources, Efficiencies, Performance, *Idaho, *Recycling.
Identifiers: Fuel reprocessing, Chemical processing, Dissolution, *Rare gas recovery.

Operation of the Rare Gas Recovery Facility at the Idaho Chemical Processing Plant during FY 1972 resulted in the recovery of 9200 curies of krypton-85 and 600 liters of xenon from off-gas produced during dissolution of spent nuclear fuel elements. Overall recovery efficiencies for krypton and xenon were 44% and 49%, respectively. Operation of a cryogenic distillation process with the potential efficiency of greater than 97% for krypton recovery was demonstrated. (Houser-ORNL)
W74-06822

EFFICIENT PRICING FOR URBAN WASTE WATER RENOVATION,
Connecticut Univ., Storrs. Inst. of Water Resources.
R. Laak, R. Leonard, and H. Kardestuncer.
Available from the National Technical Information Service as PB-231 353, $3.25 in paper copy, $1.45 in microfiche. Completion Report, 1973. 41 p, 4 tab, 5 fig, 6 ref. OWRR B-006-CONN(2). 14-31-0001-3266.

Descriptors: *Waste water treatment, Pricing, *Copper, *Activated sludge, *Mathematical models, *Cost allocation, *Industrial wastes, Effluents, Operations.
Identifiers: Unit processes, Unit operations, Treatment efficiency, Cost estimation.

For nontoxic wastes a pricing system was developed for allocating actual cost in proportion to the marginal costs associated with volume and the weight of selected contaminants. The pricing method can be used for separate allocations of capital cost and operating and maintenance cost. Digital simulation models developed for preliminary design of wastewater treatment systems can be used in estimating marginal costs for volume and weight of major contaminants. Copper affected

unit operations and unit processes of the activated sludge treatment. Activated sludge was capable of retaining a significant portion of the applied copper. The efficiency of the activated sludge aerator and final settling units were a function of copper concentration, mixed liquor suspended solids, organic loading and the overflow rate. The overall effect of copper on treatment was a function of environmental variables. No reliable basis was found for including toxic wastes in a system of charges for industrial wastewater treatment.
W74-06828

QUALITY IMPROVEMENT OF FEEDLOT LAGOON WATER BY PERCOLATION THROUGH SOIL UNDER NATIVE PASTURE,
Kansas Water Resources Research Inst., Manhattan.
W. L. Powers, L. S. Murphy, and B. R. Bock.
Available from the National Technical Information Service as PB-231 355, $3.75 in paper copy, $1.45 in microfiche. Contribution No. 131, January 1974. 50 p, 15 fig, 14 tab, 1 ref. OWRR A-046-KAN(1). 14-31-0001-3516.

Descriptors: *Feedlots, *Percolation, *Soil chemical properties, *Water reuse, *Waste water treatment, Groundwater, *Bromegrass, Potassium, Absorption, Nitrogen, *Phosphorus.

Beef feedlot runoff retained in catchment lagoons was applied as an irrigant for bromegrass to determine the effects of this practice on bromegrass yields, bromegrass N, P, K concentrations and uptake, selected soil chemical properties, and groundwater quality beneath the application area. Average applications of 9.3 and 19.0 cm of diluted lagoon water, 9.5 and 16.6 cm of straight lagoon water, and 8.0 cm of well water in one irrigation season produced no consistent differences. Lagoon water applications produced an accumulation of extractable K in the soil profile at the 0- to 90-cm depth for all treatments; largest accumulation was observed in the straight lagoon water treatment, an increase of from 470 to 588 ppm. Although approximately twice as much P was added in the lagoon water treatments as was removed by the bromegrass in one growing season, the average weak Bray extractable P for the 0- to 300-cm depth and for the 0- to 30-cm depth decreased for all treatments. After the first season of lagoon water applications, a moderate increase in the average water soluble Cl- content of from 3 to 5 ppm was observed for the 0- to 300-cm depth. Analyses of groundwater samples from beneath the application area at depths of 7.6 and 21 m revealed highly significant differences between these depths relative to concentrations of NO3--N, Ca, Mg, K. Na, Cl-, and electrical conductivity values. Concentrations greater than 10 ppm for NO3--N in the shallow wells were common while the mean for all NO3--N values from the deep wells was 0.04 ppm. Mean values of 0.12 and 0.11 ppm were found for NH4+-N in the shallow and deep wells respectively.

AMMONIA-NITROGEN REMOVAL BY BREAKPOINT CHLORINATION,
District of Columbia Dept. of Environmental Services, Washington.
T. A. Pressley, D. F. Bishop, A. P. Pinto, and A. F. Cassel.
Copy Available from GPO Sup Doc, as EP1.23:670/2-73-058, $0.95; microfiche from NTIS as PB-231 378 $1.45. Environmental Protection Agency, Technology Series EPA-670/2-73-058, September 1973. 45 p, 17 fig, 7 tab, 21 ref. EPA Project 11010 EYM. Contract 14-12-818.

Descriptors: *Waste water treatment, *Ammonia, Nitrogen, Filtration, Oxidation, *Chlorination, Chlorine, Alkalinity, Nutrients, *District of Columbia.
Identifiers: *Breakpoint chlorination, Lime clarification, Free chlorine, Nitrogen trichloride.

In laboratory studies of breakpoint chlorination, sodium hypochlorite oxidized the ammonia in buffered distilled water (with 20 mg/l of NH3-N), raw wastewater, lime clarified and filtered raw wastewater, secondary effluent and lime clarified and filtered secondary effluents to chiefly nitrogen gas. In the oxidation of this buffered water and the wastewaters, only small amounts of NO3-N (0.3 mg/l at pH 5 to 2.0 mg/l at pH 8) and NCl3-N (0.05 mg/l at pH 8 to 0.3 mg/l at pH 5) were produced. The oxidation of ammonia to N2 gas was best accomplished in the pH range 6-8. A Cl:NH3-N ratio of approximately 8:1 was sufficient for the buffered water and the highly treated wastewater. However, increasing Cl:NH3-N ratios (8-10:1) were required as the degree of pretreatment of the wastewater decreased. In the pilot breakpoint operation, chlorine gas with sodium or calcium hydroxide for pH control was efficiently mixed with filtered secondary effluent and with lime clarified and filtered raw wastewater. Greater than 95% of the NH3-N was converted to N2 gas. Operation at controlled pH greater than 6.0 and with low residuals of free Cl2 (2 mg/l) produced essentially no nitrogen trichloride and modest amounts of NO3-N (0.6 mg/l). (Kisenbauer-EPA)

ACTIVATED SLUDGE TREATMENT SYSTEMS WITH OXYGEN,
District of Columbia Dept. of Environmental Services, Washington.
J. B. Stamberg, D. F. Bishop, and A. B. Hais.
Copy Available from CPO Sup Doc as EP1.23:670/2-73-073, $0.90; microfiche from NTIS as PB-231 379 $1.45. Environmental Protection Agency, Technology Series Report EPA-670/2-73-073, September 1973. 36 p, 11 fig, 4 tab, 15 ref. EPA Project 11010 EYM. Contract 14-12-818.

Descriptors: *Waste water treatment, Sedimentation, Phosphorus, Alkalinity, Biological treatment, *Activated sludge, Oxidation, *Oxygen, Oxygenation, *District of Columbia, Aerobic conditions, Biodegredation, Biochemical oxygen demand, Dissolved oxygen.
Identifiers: *Oxygen activated sludge, *Clarification, Suspended solids, Step aeration, Contact stabilization, Solids handling.

The gas-tight biological reactor with 2.5 hour detention time or less insolubilized the biodegradable organics to less than 5 mg/l of soluble BOD. The organisms in the mixed liquor were maintained between 4000 and 8000 mg/l. Above a solids retention time (SRT) of six days, the rate of activity in the oxygen volatile solids was greater than in a parallel step aeration system. Ninety-five (95) percent of the oxygen supplied was consistently utilized in the staged reactor, which employed co-current liquid and gas flow contacting. The liquid solids separation was accomplished by conventional clarification. The clarification efficiency was a function of mixed liquor concentration, particle shape, particle density and seasonal variation (i.e., temperature, metabolic changes, and load variation). During the warmer temperature periods, the peak overflow rates of 1940 gal/day/sq ft were observed. In colder temperature periods, maximum steady state overflow rates of 975 gal/day/sq ft were obtained. The underflow solids varied with overflow rate, clarifier volume and recycle rate. Underflow concentrations up to 2.5% were obtained. Above an SRT of six days, the total production of solids was significantly less than the solids production in a similarly operated step aeration system. At an SRT of 13 days, 0.35 lb. of solids/lb. of BOD were produced.
W74-06839

LABORATORY OZONATION OF MUNCIPAL WASTEWATERS,
District of Columbia Dept. of Environmental Services, Washington.
S. G. Roan, D. F. Bishop, and T. A. Pressley.
Copy available from GPO Sup Doc as EP/23:670/2-73-075, $0.85; microfiche from NTIS as PB-231 380 $1.45. Environmental Protection Agency, Technology Series Report EPA-670/2-73-075, September 1973. 38 p, 15 fig, 4 tab, 23 ref. EPA Project 11010 EYM Contract 14-12-818.

Descriptors: Oxidation, *Ozone, *Waste water treatment, Chemical Oxygen demand, Tertiary treatment, Sewage treaetent, Ammonia, *District of Columbia.
Identifiers: *Waste water ozonation, Oxidation efficiency, Nitrogen oxidation, Total organic carbon.

Raw wastewater, secondary effluent, lime clarified and filtered raw and secondary wastewaters, carbon treated wastewaters, and breakpoint chlorinated plus carbon treated wastewaters were ozonated at pH 7.0 over a range of 5.90 minutes contact time. Ozonation of the raw wastewater, with high solids and COD content required impractical ozone dosages for appreciable COD removal. In all effluents, except raw wastewater, 100 mg/l of ozone produced at least a 70% COD removal. Organic oxidation efficiencies in the raw and secondary wastewaters, based upon one atom of available oxygen per molecule of ozone, exceeded 100% indicating that one or more atoms of the ozone molecule or molecular oxygen participated in the organic oxidation mechanism. Variable amounts of organic nitrogen and ammonia were oxidized at pH 7.0 by ozone to nitrate. Organic nitrogen and ammonia oxidation to nitrate increased with increased pretreatment (lower initial COD in the wastewater) and increased pH. Nitrate residuals formed by the oxidation of ammonia and or organic nitrogen at the 70% COD removal level were less than 3 mg/l. The ozone distribution ratio between oxidation of the NOD and COD, and the COD removals as a function of ozone dose suggested that the relative order of oxidation was; easily oxidizable organic material, NH3, TKN, and slowly oxidizable (nearly refractory) organic material. (EPA)

NITROGEN REMOVAL BY AMMONIA STRIPPING,
District of Columbia Dept. of Environmental Services, Washington.
T. P. O'Farrell, D. F. Bishop, and A. F. Cassel.
Copy Available from GPO Sup Doc as EP1.23:670/2-040, $0.65; microfiche from NTIS as PB $1.45. Environmental Protection Agency, Technology Series Report EPA-670/2-73-040, September 1973. 23 p, 9 fig, 1 tab, 8 ref. EPA Project 11010 EYM Contract 14-12-818.

Descriptors: Ammonia, *Mass transfer, Calcium carbonate, Lime, *Waste water treatment, *Scaling, *District of Columbia.
Identifiers: *Air Stripping, *Ammonia removal.

Ammonia removals of up to 90% from lime clarified filtered wastewater were obtained in a five stage counter current cross flow stripping tower using air to liquid rates of 400 to 500 cu ft/gal. Decreases in operating temperatures from 78F to 43F during the cold weather reduced the stripping efficiency by 30% and caused icing in the tower. The variation of stripping efficiency was also studied as a function of the inlet pH of the water and the ratio of the air to liquid rate. The rate of calcium carbonate scaling on the tower was determined for wastewater pH's of 11.5 and 10.5. The heights of transfer units (HTU) were estimated by using a mathematical model and a computer iterative technique. (EPA)

BIOLOGICAL TREATMENT OF FEEDLOT RUNOFF,
Nebraska Univ., Lincoln. Dept. of Civil Engineering.
M. V. O'Neal.

Available from the National Technical Information Service as PB-231 479 $6.25 in paper copy $1.45 in microfiche. MS Thesis, September 1973. 52 p. OWRR A-027-NEB(3).

Descriptors: *Biological treatment, *Feed lots, *Farm wastes, Water quality, Cattle, Nitrates, *Waste water treatment, Organic loading, *Activated sludge, Flocculation, Suspended solids, Chemical oxygen demand, Pilot plants, *Nebraska, Nitrogen compounds.
Identifiers: *Feedlot runoff, Clarifiers.

The purpose of this study was to operate and evaluate the performance of a completely mixed activated sludge unit system. Performance was to be evaluated by comparison to parameters established in the laboratory studies and by ease of operation and maintenance under field conditions. Conclusions reached were: (1)Organic loading of 0.2 gm COD/gm mixed liquor suspended solids (MLSS) or less will maximize waste strength reduction. (2) The clarifier can effectively retain solids in the system. Effectiveness of sedimentation depends upon maintenance of a flocculant sludge and MLSS concentrations not exceeding 6,000 mg/1. (3) The unit is generally maintenance free and easy to operate. Periodic measurements of settled volume provide adequate control of MLSS. (4) Foaming can become quite severe and affect the system by removing solids. Thus, laboratory studies have concluded that the runoff is amenable to aerobic treatment and a field unit was designed applying the results of these studies in order to evaluate the success of such a system in pilot scale operation. The success and subsequent application of this system will depend on the economics involved and the degree of treatment attainable.

EFFECTS OF SEWAGE DISPOSAL AND RECLAMATION ON GROUND WATER QUALITY,
California State Dept. of Public Health, Sacramento. Environmental Sanitation Div.
H. F. Collins.
In: Proceedings of 9th Biennial Conference on Ground Water, Sept 13-14, 1973, Francisco Torres Conference Center, Goleta, Calif: California University Water Resources Center Report No 26, p 66-77, December 1973. 4 tab, 15 ref.

Descriptors: *Waste disposal wells, *Water reuse, *Reclaimed water, *Water quality, Water pollution, Monitoring, Water pollution effects, *California, Artificial recharge, Water spreading.

Waste water spreading operations are used at selected sites in California. The City of Oceanside, followed by the County Sanitation Districts of Los Angeles County, were among the first to employ recharge by a planned spreading operation. Other planned surface recharge operations have been carried out at various locations throughout the state but only four which recharge an aquifer supplying domestic water are in operation at the present time. A few projects in California have investigated the use of reclaimed water as a source of injected water. Pilot studies were carried out from 1952 to 1963 at the Hyperion Sewage Treatment Plant, and from 1965 to 1971 by the Orange County Water District. The effects of percolating waste water on the quality of the groundwater will vary widely from one location to another depending on: (1) application rates, (2) the characteristics of the waste water, (3) geological considerations, (4) the nature of the soil, and many other factors. Constituents in the waste water that are of primary concern from a health viewpoint are biological pathogens, stable organics, and heavy metals. The soil mantle appears to be quite efficient in the removal of bacteria, viruses and many other constituents. In direct injection, the treatment phenomena which occur with percolation through the soil are not provided, nor are they duplicated with groundwater movement. Consequently, the quality of the injected water must be such that it is suitable for the eventual intended uses. The quality must be such that no adverse changes will occur in the underground travel which will impair its use for extraction. (See also W74-06942) (Knapp-USGS)

USE OF WASTE HEAT FOR SOIL WARMING IN NORTH CAROLINA,
North Carolina State Univ., Raleigh. Dept. of Biological and Agricultural Engineering; and North Carolina State Univ., Raleigh. Dept. of Horticultural Science.
R. W. Skaggs, C. R. Willey, and D. C. Sanders.
Paper No. 73-3530 presented at 1973 Winter Meeting, American Society of Agricultural Engineers, Chicago, Ill., Dec. 11-14, 1973, 30p. 13 fig, 1 tab, 9 ref. OWRR A-060-NC(1). 14-31-0001-4033.

Descriptors: *Thermal pollution, *Heated water, *North Carolina, *Soil temperature, Irrigation effects, *Land disposal, Cooling water, Heat transfer, Power plants, *Beneficial use.

A promising alternative for removing waste heat from condenser cooling water is by using the spent cooling water for soil warming, irrigation, and evaporative cooling of soil and plant surfaces. Heat can be transferred to the soil by circulating the heated water through a network of buried pipes. In addition to removing heat, soil warming systems may stimulate crop production (sometimes doubling yield), increase the length of growing seasons, and allow earlier harvesting (and marketing). This paper describes, interprets, and extrapolates field studies of waste heat removal by soil warming in North Carolina in terms of (1) the capacity of the soil system (Wagram sandy clay loam) as a heat sink and its variation over seasons of the year and (2) the temperature regimes maintained when heated waters are used for soil warming in combination with subsurface irrigation and low volume surface irrigation. Based on extrapolation of experimental data, the land area required to handle the waste heat from a 1,000 megawatt nuclear power plant in North Carolina would be about 13,100 acres during the hottest months, based on a soil warming system of one-inch diameter plastic pipes buried 20 inches deep and 20 inches apart and a temperature reduction from 100F to 80F. The acreage required can be reduced using sprinkler irrigation and subsurface irrigation. Acreage requirements also vary with ambient temperature (much lower in winter months); pipe diameter, and spacing; flow rate; entering water temperature, and temperature differential, i.e., the difference between inlet and outlet temperatures. (McJunkin-North Carolina)

SEARCH FOR A METHOD FOR SANITIZING SEWAGE FROM HELMINTH EGGS USING AGROCHEMICAL MEANS. (PRELIMINARY COMMUNICATION), (IN RUSSIAN),
Institute of Medical Parasitology and Tropical Medicine, Moscow (USSR).
Yu. A. Chefranova.
Med Parazitol Parazit Bolezn. Vol 41, No 4, p 440-444, 1972. (English summary).
Identifiers: Agrochemicals, *Ammonium water, Ascarid eggs, *Helminth eggs, Methodology, *Farm wastes, *Sewage treatment, Water pollution control, Waste water treatment.

A search was made among fertilizers used in agriculture of substances possessing an ovocidal effect on ascarid eggs in sewage. The addition of ammonium water to sewage could be accompanied by death of ascarid eggs. The ovocidal effect was observed when the content of ammonium was 2.5% or more and was similar in the following substrates: feces water, feces mixture with urine, sewage precipitate and pig manure. The ovocidal effect of ammonium water depends on concentration, exposure and temperature.--Copyright 1973, Biological Abstracts, Inc.

INFORMATION RESOURCE: FINAL REPORT WATER POLLUTION CONTROL IN WATER UTILITIES,
American Water Works Association Research Foundation, New York.
H. A. Faber, A. D. Nardozzi, and M. J. Taras.

Copy available from GPO Sup Doc as EP1.23:660/2-73-020, $1.05; microfiche from NTIS as PB $1.45. Environmental Protection Agency Technology Series Report EPA-660/2-73-020, December 1973. 64 p, 3 tab. EPA Project 12120 EUR.

Descriptors: *Sludge disposal, *Sludge treatment, *Abstracts, *Water treatment, Water purification, Utilities, Information exchange, Treatment facilities, Surveys, Water pollution control.
Identifiers: *Information clearing-house, *Information resource, *Water utility sludge, Information dissemination.

The goals of this effort were the collection, coordination, and communication of information of a scientific, technical, and administrative nature relative to control of pollution caused by wastes from water treatment plants, in accordance with the recommendations of an industry advisory committee. It covers laboratory tests underway or completed at widely dispersed water treatment plants throughout the country on the applicability of polymers as primary coagulants, coagulant aids, and sludge conditioning agents, with the objective of alleviating the problem of water treatment plant waste disposal. Also included is the evaluation in cooperating laboratories of analytical methods suitable for the physical and chemical examination of the sludge and sludge solids from water treatment plants. A total of 121 abstracts of technical articles were prepared on the varied aspects of water treatment plant waste disposal: waste problems at 26 named water treatment plants or geographical locations, waste treatment in the new water treatment plants, water conditioning practices, characteristics of alum, iron, and softening wastes; treatment of filter washwater; treatment of sludge by the reclamation of alum, lime, and magnesium carbonate, and by dewatering processes involving centrifugation, drying beds, filter pressing, freezing, and vacuum filtration; subsurface disposal and disposal of brine wastes. Identifiers: *South Africa.

The availability of water in South Africa in relation to the demand for water on the part of the various sectors of the community is reviewed. Differences in the quality of water from various sources are discussed in relation to the quality standards applicable to water used for industrial, agricultural and domestic purposes. The application of a systems approach to the regulation of water quality is advocated. (DWA)

Available from the National Technical Information Service as PB-231 471, $3.25 in paper copy, $1.45 in microfiche. Kansas Water Resources Research Institute, Manhattan, Contribution No. 138, March 1974. 34 p, 6 tab, 28 ref. OWRR A-033-KAN(1). 14-31-0001-3216.

Descriptors: *Nitrates, *Nitrites, *Resins, Water pollution, *Ion exchange, Separation techniques, *Waste water treatment.
Identifiers: Diethylaminoethanes, Nitrobenzoates, Bio-Rex 70, Bio-Gel P-300, Bio-Gel P-30, Bio-Gel P-4, Nitron.

The basic idea was to add known nitrate selective compounds to currently available ion exchange resins to produce a resin that would selectively remove nitrate from contaminated waters, be easy to handle, and be capable of regeneration. Three such resins were made and tested and were found to have some selectivity but were entirely inadequate with regards to capacity. The compounds used were alpha-phenyl-alpha-hydroxy-beta-diethylaminoethane and alpha-phenyl-beta-diethylaminoe-thyl-rho-nitrobenzoate on Bio-Rex-70 and Bio-Gel P-300, P-30 and P-4. Studies were also begun using nitron and N-diethylbenzohydrylamine.

THE FEDERAL ROLE AND LEGISLATIVE TRENDS IN CONTROL OF GROUND WATER QUALITY,
Environmental Protection Agency, San Francisco, Calif. Region IX.
B. D. Clark.
In: Proceedings of 9th Biennial Conference on Ground Water, Sept 13-14, 1973, Francisco Torres

Conference Center, Goleta, Calif: California University Water Resources Center Report No 26, p 104-109, December 1973.

Descriptors: *Water pollution control, *Groundwater, *Federal water pollution control act, Monitoring, Regulation, Water quality act, Planning, *California, Water law.

The passage of PL92-500 authorizes the Environmental Protection Agency and the various states to control groundwater quality. The EPA has authority in groundwater quality control in four areas--monitoring and evaluation, research and demonstration, planning and management, and enforcement--with primary emphasis in monitoring and evaluation to provide an assessment of the problem and derive means for control. CURRENT STATE BOARD ACTIVITIES IN GROUND WATER QUALITY MANAGEMENT,
California State Water Resources Control Board, Scramento.
P. A. Rogers.
In: Proceedings of 9th Biennial Conference on Ground Water, Sept 13-14, 1973, Francisco Torres Conference Center, Goleta, Calif: California University Water Resources Center Report No 26, p 110-113, December 1973.

Descriptors: *Water pollution control, *Groundwater, *Federal water pollution control act, Monitoring, Regulation, Water quality act, Planning, *California, Water law.

Some activities of the California State Water Resources Control Board under the new federal and state law are discussed particularly in relation to groundwater. Probably the most significant aspect of the new law is that it has forged a new partnership between the Federal Environmental Protection Agency and the State. The State Board, by contract, is preparing comprehensive water quality control plans for each of the 16 hydrologic basins in the State. This is a $7 million effort which is about 75% completed. These plans will be the basis for setting State and regional water quality standards, the disbursement of State and federal grant funds for construction of waste water treatment facilities, and for the delineation of water quality objectives to achieve and maintain the beneficial uses of the state's waters. These plans designate the waste water facilities to be built in California for the next 20-30 years. In addition to surface waters, the basin plans also concern groundwater quality management, particularly problems of salt balance, effects of waste water disposal, and problems associated with interbasin transfer of water. Of major concern are the effects from both point and nonpoint sources. (See also W74-06942) (Knapp-USGS)
W74-06953

IMPACT OF WATER POLLUTION CONTROL LEGISLATION ON MEETING FUTURE WATER NEEDS IN CALIFORNIA,
California State Dept. of Water Resources, Sacramento.
J. R. Teerink.
In: Proceedings of 9th Biennial Conference on Ground Water, Sept 13-14, 1973, Francisco Torres Conference Center, Goleta, Calif: California University Water Resources Center Report No 26, p 114-118, December 1973.

Descriptors: *Water pollution control, *Groundwater, *Federal water pollution control act, Monitoring, Regulation, Water quality act, Planning, *California, Water law.

In the context of meeting future water needs in California, the opportunities presented by water pollution control legislation are in two areas. Planning of water supply and waste disposal, both quantity and quality, is being integrated. Water pollution control and water quality legislation promote more efficient use of water, including the use of groundwater storage, as compared to surface dams and reservoirs. Waste-water reclamation is the major link between waste disposal and water supply; it is the mechanism which makes it possible for good quality water to be used again before ultimate disposal. Waste-water reclamation often produces water of appropriate mineral quality to be recharged to a groundwater basin. Once in the basin, it may be pumped for any use, including domestic. The State Department of Public Health is considering allowing up to 10% of the recharge to a basin to be reclaimed water. (See also W74-06942) (Knapp-USGS)
W74-06954

GROUND WATER POLLUTION--FROM THE WASTE DISCHARGER'S VIEWPOINT,
Gilbert (J.B.) and Associates, Sacramento, Calif.
J. B. Gilbert.
In: Proceedings of 9th Biennial Conference on Ground Water, Sept 13-14, 1973, Francisco Torres Conference Center, Goleta, Calif: California University Water Resources Center Report No 26, p 119-125, December 1973.

Descriptors: *Water pollution control, *Groundwater, *Federal water pollution control act, Monitoring, Regulation, Water quality act, Planning, California, Water law.

Because of new water pollution legislation in California, dischargers have an increasingly realistic view of the beneficial use of waste waters. They also tend to have a pragmatic view of groundwater quality, one that is frequently influenced by short-term economic or operational considerations as opposed to long-term regional water resources management. Groundwater management must be accomplished for each basin, following a definitive plan. The discharge of concentrated pollutants with irreversible long-term damage should be avoided. The control of total dissolved solids and other salts must be determined separately, considering the long-term usefulness of the basin, alternative water supplies, and the best use of the waste water containing the salts. THE NATIONAL ENVIRONMENTAL POLICY ACT AND THE LICENSING PROCESS: ENVIRONMENTALIST MAGNA CARTA OR AGENCY COUP DE GRACE,
A. W. Murphy.
Columbia Law Review, Vol 72, No 6, p 963-1007, October 1972. 176 ref.

Descriptors: *Agencies, *Nuclear powerplants, *Environmental effects, *Electric power, Water quality standards, Public utilities, Reasonable use, Water policy, Industries, Administration, Electric powerplants, Legislation, Legal aspects, Regulation.
Identifiers: National Environmental Policy Act(NEPA).

An extensive and comprehensive analysis is presented of the National Environmental Policy Act (NEPA) and the licensing process of the Atomic Energy Commission for facilities engaged in the production of electric power. The job required of the Atomic Energy Commission by NEPA, as interpreted by the courts, is one which the agency cannot perform, and, in any event, one which the licensing process as it currently exists is ill-designed to handle. The task imposed on an already overburdened structure has had, at least temporarily, a disastrous impact. The situation is described and the reasons for the crisis are analyzed. Suggestions are offered for changes in the structure of the licensing process to enable the AEC and other agencies to better deal with environmental questions. For power plant licensing, certain steps seem to be necessary before the goals of NEPA can be realized. Congress must make some specific judgments as to energy policy, structure of the power supply industry, organization of the regulatory process, and, more fundamentally, national growth policy. (Mockler-Florida)
W74-06963

COASTAL WETLANDS IN NEW ENGLAND,
D. P. Hill
Boston University Rev., Vol 52, p 724-762, Fall 1972. 207 ref.

Descriptors: *Legal aspects, *Wetlands, *Coastal marshes, Swamps, Aquatic Environment, Land reclamation, Wildlife conservation, Governments, Water injury, Terrestrial habitats, Land use, Regulation, Environment, Environmental effects, Eminent domain, Adjacent land owners, High water mark.

A comprehensive analysis is presented of coastal wetlands in New England and the problems faced by those interested in the regulation and protection of coastal wetlands resources through the legal process. The most immediate threat to the wetlands lies in their direct alteration and destruction by man and, therefore, land use controls should be used as the essential ingredient of a viable wetlands program. Moreover, a constitutional interpretation which would allow the states to protect valuable public resources by denying individual landowners the right to interfere with natural systems is essential. Also, effective control of marsh areas located above the high water line, which are held extensively in private hands, is critical to effective conservation. Such control is confused by legal uncertainty over the 'taking' question raised by state regulations. The prospects for New England coastal wetlands may well rest on the shoulders of those in the legal profession concerned and imaginative enough to devise acceptable machinery for effective regulation and preservation. WILL MUNICIPAL SEWAGE CONTINUE TO THREATEN PRIMARY WATER-CONTACT RECREATION: AN APPRAISAL OF THE 1972 WATER POLLUTION CONTROL ACT,
D. J. Kuchenbecker, and D. E. Long.
Rutgers-Camden Law Journal, Vol 4, p 260-288, Spring 1973. 242 ref.

Descriptors: *Water pollution, *Federal Water Pollution Control Act, *Legislation, Permits, Water quality control, Sewage disposal, Waste, Environmental protection, Water resources, Recreation demand, Sewage, Sewage treatment, Water pollution sources, Recreation, Water, Water quality, Water quality standards, Effluents.
Identifiers: Environmental quality, Discharge control, Effluent limitations.

Increasing demands on the Nation's water resources for recreational activities and continuing deterioration of the aquatic environment, largely due to negligent discharge of waste into the waterways, led Congress to enact the Water Quality Act of 1965 as an amendment to the Federal Water Pollution Control Act (FWPCA). The FWPCA as then amended required states to submit water quality standards for review by the Secretary of Interior who would approve those which protected public health and welfare. Weaknesses persisted, however, leading Congress to enact the FWPCA Amendments of 1972. Four areas of the 1972 amendments are of special significance to water recreationists. These areas are: (1) financial authorization to assist states in construction of

necessary sewage treatment plants; (2) effluent limitations at point of discharge instead of water quality standards; (3) requirement that municipalities obtain a permit to continue discharges in Nation's waters; and (4) streamlining of enforcement procedures. By enactment of the FWPCA Amendments, Congress set in motion a forceful program to meet demands of water recreationists nationwide. (Daniels-Florida)

URBANIZATION AND HUMAN HEALTH,
T. Bakacs.
Akademiai Kiado: Budapest, Hungary, 1972. 168 p, Illus. Maps, Price $7.00.
Identifiers: Agricultural pollution, Air pollution, Chemicals, *Ecology, Sanitation, Soil, *Urbanization, *Public health, Water pollution, Cities, Human population, Publications.

The basic biological problems of urbanization, such as the direct and indirect factors responsible for the disruption of a balanced ecology, are discussed. The extent to which the increasingly artificial environment and agricultural chemicals are responsible for this imbalance is examined. The measures necessary for the prevention of unknown long-term reactions are discussed. Air and water pollution, inadequate sewage treatment and complex health injuries connected with the urban environment are analyzed. Part 1 (Man and his Environment) discusses human ecosystems, population explosion, and the introduction of biologically active agents into the environment. Part 2 (Urbanization Induced Health Hazards) discusses the processes of urbanization, air pollution, water supply and sanitation, problems of preserving soil quality in urban areas and the complexity of urbanization noxae. Part 3 (Conclusions and Perspectives) discusses economic and demographic conclusions and future tasks and perspectives. Numerous diagrams, tables, graphs and photographs are included and each section ends with an extensive list of references.--Copyright 1973, Biological Abstracts, Inc.

CONTROL OF MOSQUITOES BREEDING IN RICE-FIELDS,
Microbiological Research Establishment, Salisbury (England).
G. Surtees.
J Trop Med Hyg. Vol 74, No 12, p 255-259. 1971.
Identifiers: *Breeding(Mosquitoes), Environment, Human diseases, Insecticides, Irrigation, *Mosquito control, *Rice fields, Water pollution control.

The different types of control measures used are reviewed and their relative effectiveness indicated. Future research priorities are proposed with particular reference to environmental manipulation. The purpose of these techniques is to reduce numbers of mosquitoes and so the level of transmission of disease agents to man. Although chemical poisons sometimes reduce larvae, they are not satistifactory for long time control. Agricultural irrigation schemes with environmental control offer long term alternatives. Environmental pollution and the toxicological hazard of insecticides on growing food plants and the development of insecticide-resistant strains of insects are avoided.--Copyright 1973, Biological Abstracts, Inc.

OBSERVATIONS ON GAMBUSIA AFFINIS INTRODUCED INTO TOKUSHIMA AS A NATURAL ENEMY OF MOSQUITOES, (IN JAPANESE),
Laboratory of Mosquito Control, Tokushima (Japan).
H. Sato, S. Okubo, M. Sasa, Y. Wada, and M. Motoki.
Jap J Sanit Zool. Vol 23, No 2, p 113-127. 1972. Illus.
Identifiers: Aedes-Dorsalis, Anopheles-Sinensis, Culex-Pipiens-Pallens, Culex-Tritaeniorhynchus, Eradication, *Gambusia-Affinis, *Japan(Tokushima), *Malaria control, Mosquitoes, Rice paddies, *Poeciliid fish.

The topminnow, G affinis (Baird et Girard, 1853), is a viviporous poeciliid fish native to the southern USA, and was introduced into a number of countries mainly for malaria control. In Japan, the fish was imported in 1916 via Hawaii and Taiwan, and was found recently to be breeding widely in polluted waters in and around the city of Tokyo. Tokushima is situated on the delta of Yoshino River, where tremendous number of mosquitoes breed every year in swamps, ditches and rice paddies difficult to drain. Surveys were carried out on the larval breeding places, and on the seasonal prevalence of adults with light traps set at 6 stations. Of 14 spp. of mosquities found in this area, Culex pipiens pallens was predominant and most widely distributed, while Anopheles sinensis and C. tritaeniorhynchus were also found abundantly in some swamp areas. In some salt marshes near the sea coast, tremendous breeding of Aedes dorsalis was observed in the rainy seasons. Under such environmental conditions, the introduction of Gambusia might be an effective measure for the control of mosquitoes. Gambusia was especially successful and effective in salt water marshes where Aedes dorsalis were breeding. Complete eradication of the mosquito larvae was achieved in these areas.--Copyright 1973, Biological Abstracts, Inc.

6. WATER RESOURCES PLANNING

6A. Techniques Of Planning

APPLICATION OF DDDP IN WATER RESOURCES PLANNING,
Illinois Univ., Urbana. Dept. of Civil Engineering.
V. T. Chow, and G. Cortes-Rivera.
Available from the National Technical Information Service as PB-231 231 $7.75 in paper copy, $1.45 in microfiche. Illinois Water Resources Center, Urbana, Research Report No. 78, January 1974, 89 p, 22 fig, 10 tab, 13 ref. OWRR B-060-ILL(4).

Descriptors: *Dynamic programming, Systems analysis, *Planning, *Project planning, *Optimization, Optimum development plans, Multiple-purpose projects.
Identifiers: *Hydroeconomic analysis, *Discrete differential dynamic programming.

A research program on advanced methodologies for water resources planning is presented. It summarizes the various achievements accomplished during the period of the project. The main portion of the project is devoted to the presentation of a working manual for use by practicing water resources engineers and analysts, showing the application of the discrete differential dynamic programming (DDDP). The brief theoretical background of the DDDP methodology and a review of the principal aspects of its theory are included. Then, a detailed description of the DDDP methodology is given, giving emphasis to the key steps of its procedure. The DDDP methodology as a means to solve already formulated dynamic programming problems is proposed. For illustrative purposes, three examples are given to show the application of the DDDP methodology in the solution of optimization problems arising from the planning and operation of the complex water resources projects.

6B. Evaluation Process

GEOGRAPHY OF WATERFOWL RESOURCES OF THE SOVIET UNION. CONDITION OF RESERVES.
Available from the National Technical Information Service as TT-71-53022, $3.00 in paper copy, $1.45 in microfiche. Trans. of Geografiya Resursov Vodoplavaeushchikh Palits v SSSR, 1972. 279 p, 41 tab.

Descriptors: *Geographical regions, *Water birds, *Population, *Protection, Ducks(Wild), Seasonal, Game birds, Breeding, Migration, Hunting, Productivity, Reproduction, Geese(Wild), Management, Marketing, Ecological distribution, Assay, Analytical techniques, Distribution, Nesting, Nesting cover.
Identifiers: *Soviet Union, *Game refuges, Swans, Cootes.

To determine a basic norm of waterfowl hunt kills, the state and distribution of the bird population, changes of the game in different years relative to conditions of breeding and wintering, and the number of birds killed by hunters should be known. Information from the entire territory of the USSR is assembled. The forms and degrees of participation of organizations for protection of bird wintering grounds should be determined for game management. To give a clear picture of waterfowl populations, mass ringing of the birds is necessary. Effects of closing the spring shooting season is discussed. An experiment was carried on to evaluate the number of waterfowl shot in the Soviet Union. Results are given of the first all-Russian count of water fowl in August 1963. Seasonal geographical distribution of pintails, migration of white fronted geese, and migration and breeding of waterfowl generally are given. Waterfowl populations are described in various areas of the north European USSR, northwest European USSR, central regions of European USSR, eastern European USSR, Azov-Black Sea areas, and the Trans Caucus, especially southeastern Trans Caucus, and the northern part of the Caspian Sea. A REVIEW OF SOVIET DATA ON THE PEACEFUL USES OF NUCLEAR EXPLOSIONS,
California Univ., Livermore. Lawrence Livermore Lab.
M. D. Nordyke.
Available from the National Technical Information Service, Springfield, Va., as Rept No. UCRL-51414; $4.00 per copy, $1.45 microfiche. Report No. UCRL-51414, June 1973. 50 p, 33 fig, 3 tab, 41 ref, append.

Descriptors: *Nuclear explosions, *Benefits, *Reviews, Research and development, Natural resources, Gas, Water resource development, Oil, Mineral energy, Water storage, Reservoirs, Craters, Channels, Secondary recovery(Oil), Storage, Seismology.
Identifiers: *Peaceful uses, *Public benefits.

Over the last several years through a series of international meetings sponsored by the International Atomic Energy Agency (IAEA) and a number of publications, the Soviet Union has disclosed that they have a very active program for developing peaceful uses of nuclear explosions (PNE) in their national economy. They have described the results of 14 experimental and industrial explosions designed to develop nine different applications in the petroleum, gas, and minerals industries as well as for water resources development. However, when one considers the large number of large unidentified seismic events that have been reported over the last seven years in areas of the Soviet Union outside the normal nuclear-weapon test areas, it is obvious that they have an even more active program than they have publicly described, one that must be approaching a routine industrial technology in some areas. The PNE program that the Soviets have publicly discussed in various reports and at various meetings is summarized and, when appropriate, compared to data from the U.S. Plowshare Program (Houser-ORNL)

INTERGOVERNMENTAL RELATIONS AS SEEN BY FLORIDA STATE LEGISLATORS: LAND USE AND WATER RESOURCE PROBLEMS,
Florida Atlantic Univ., Boca Raton
K. E. Hamm.
Available from the National Technical Information Service as PB-231 481 $8.75 in paper copy, $1.45 in microfiche. MA Thesis, 1973. 102 p, 18 tab, 30 ref. OWRR A-020-FLA(2) 14-31-0001-3809

Descriptors: *Attitudes, Inter-agency cooperation, *Land use, *State governments, Local governments, Federal government, *Governmental interrelations, *Political aspects, *Water resources development.

The major purposes were (1) to ascertain legislators' perceptions of intergovernmental relations for policy issues and (2) to seek an explanation for these perceptions. The central focus was on the 1972 Florida Legislature. Specifically, the focus was on the legislators' perceptions with regards to land use and water resource problems in Florida. The study found that the greater the perceived seriousness of sewage treatment, water pollution, open space preservation, water supply and planning and zoning problems, the greater the preference for a governmental policy emphasizing shared responsibility among local, state and federal governments. On the other hand, the majority of the legislators perceived 'traditional' land use and water resource problems--droughts, drainage and floods--not to be as severe as the 'contemporary' problems. Therefore, the legislators preferred to have only a single level of government be responsible for solving the problem. The second major area of analysis dealt with the degree to which state, federal and local governments were to be involved in either competitive or cooperative intergovernmental relations. For land use and water resource problems, the state was mentioned by the legislators in over 70 per cent of the replies but with the majority of these involving cooperation with either local governments or local and federal governments. Legislators seem to regard the state as the unit of government where basic responsibility for domestic problem solution should be located when the problem is not severe; but this attachment to the state decreases as problem intensity increases.

AREA FINANCING OF WATER RESOURCE DEVELOPMENT IN WEST MINNESOTA,
Minnesota Univ., St. Paul. Dept. of Agricultural and Applied Economics.
W. R. Maki.
Available from the National Technical Information Service as PB-231 476 $4.75 in paper copy, $1.45 in microfiche. University of Minnesota, St. Paul, Water Resources Research Center. Bulletin 66, January 1974. 123 p, 7 fig, 56 tables, 94 ref. OWRR B-044-Minn(3).

Descriptors: *Financing, *Water Resources Development, *Planning, *Minnesota, *Alternative planning, Economic efficiency.
Identifiers: Area Product Accounts, Income accounts, *Public financing Potentials.

A 14-county environmental planning area in West Minnesota was identified for the purpose of studying financing alternatives in water resource development. Altogether, 719 units of local government (exclusive of the newly established planning commissions) were included in the study area in 1967, which is the base year for the study. Economic and organizational structures in the 14-county area are described and analyzed. A computable model of the area economy is presented. Estimates of the degree of internal interdependence of the area economy are derived as basis for assessing the current status of the area economy and its public financing potentials. The base-year data are used subsequently in the preparation of a projected 1980 inter-industry transactions table. An expanded system of area product and income accounts is presented, also, for both the base year and the target year. These accounts are used in assessing the public economy as part of a total area economy. Water resource development potentials and financing requirements and alternatives are identified in the contest of all public expenditures and outlays in a multi-county area. (Walton-Minnesota)

TECHNIQUES FOR IDENTIFYING AND EVALUATING MARKET AND NONMARKET BENEFITS AND COSTS OF WATER RESOURCE SYSTEMS.
Texas Water Development Board, Austin. Systems Engineering Div.
Available from the National Technical Information Service as PB-231 485 $6.00 in paper copy, $1.45 in microfiche. Completion Report, June 1973. 227 p, 59 fig, 33 tab, 34 ref. OWRR C-3352(3738)(1).

Descriptors: Planning, *Economic impact, Environmental effects, *Texas, Social aspects, Long-term planning, Water allocation, Water resources development, Multi-purpose projects, *Input-output analysis, Resource allocation, Mathematical models, Aquatic environments, Terrestrial habitats, Systems analysis, *Regional analysis, *Cost benefit analysis, *Simulation analysis, *Water policy, *Alternative planning, Water management(Applied), Water demand.
Identifiers: Lake Whitney(Tex), Lake Lewisville(Tex), Lake Belton(Tex).

This research project was designed to provide a set of analytical tools for water resource planners and decision-makers to assist them in measuring and evaluating the market and non-market benefits and costs of water resource systems. The techniques are designed to be sufficiently flexible to analyze all types of water development and management policies. This report describes: (1) the techniques developed to measure the economic, environmental, and social impacts of water policy alternatives, and (2) the application of these techniques to a test case of three existing reservoirs to determine the method's efficacy. The analyses are conducted in three major areas: economic, environmental, and social. In the economic area a regional input-output model, modified to operate in a simulation framework, is used to estimate demand and output in the regional economy subject to primary resource constraints, which include water. Environmental effects of water development and management are estimated by using a simulation model of the aquatic environment. Social impacts of water resource systems are considered by means of selected social indicators and the differences in perceived and measured changes thereto. The three impact areas are tied together in an evaluative framework and a methodology is presented for asking and answering questions about water policy alternatives using the simulation techniques.

The Annals of Regional Science, Vol 8, No 1, p 35-50, February, 1974. OWRR B-136-CAL(2).

Descriptors: *Recreation, Economics, *Simulation analysis, Recreation facilities, *California, *Planning, *Projections, Model studies, Alternative planning, Demand.
Identifiers: *Salton Sea(Calif).

Conventional demand based approaches to recreational economics are reviewed and found unsuitable for analyzing the effects of changes of the quality of recreation. An alternative approach using a simulation model is proposed, which allows the use of both quantitative data and subjective input on the qualitative effects. The critical economic variables are found to be fishing recreation visitor days and investment in recreational facilities at the Salton Sea, California. The model results are projected for 20 years and key parameters and assumptions are identified by parametric analysis. These parameters were then subjected to critical interaction by a group of specialists in the area, during a workshop session. Results of the final model are compared to a previous economic study of the region and found to be more pessimistic about the benefits of quality control. Verification of the model is performed by tests of deviation of the predictions of visitor days by the model from the actual visitor days recorded over eight years.

WATER SUPPLY MANAGEMENT ALTERNATIVES FOR RHODE ISLAND,
Analytic Sciences Corp., Reading, Mass.
R. J. Martel.
Available from the National Technical Information Service as PB-231 362, $4.00 in paper copy, $1.45 in microfiche. Final Report No. TR-319, October 1973, 60 p. 13 fig, 6 tab, 24 ref. OWRR C-4260(No 9039)(1). 14-31-0001-9039.

Descriptors: Water resources development, Forecasting, State governments, *Rhode Island, Planning, Water conservation, Water policy, *Water supply, Reservoirs, Groundwater, Economics, Water requirements, *Water demand, *Management, *Alternative planning.
Identifiers: Big River(R.I.), Wood River(R.I.).

Water supply management in Rhode Island has evolved under the traditional public service criterion of meeting the projected requirements for water. Continuation of this policy could exhaust the state's developable fresh water resources in another 40 years. An alternative is for the state to adopt a policy of resource management, under which both supply and demand would be regulated to achieve broader economic and social objectives. The Big-Wood reservoir project provides the state government with an opportunity to implement resource management policies by maintaining control over the development of these reservoirs and the allocation and pricing of their waters. The economic, environmental, and institutional implications of this project are analyzed, and policy options for the state are presented. The technical approach is a systems analysis of policy alternatives. It was concluded that the broader economic, social and environmental implications of water supply development weigh in favor of the state retaining its responsibility for developing and managing the water and related land resources of the Big River and Wood River basins.

Identifiers: *Deepwater ports, *Bulk commodities, Crude petroleum, Petroleum products, Iron ore, Bauxite, Alumina, Meal, Phosphate rock, China, Japan, Western Europe.

The increasing demands on United States deepwater ports handling bulk commodities, specifically petroleum, raw aluminum materials, phosphate rock, bituminous coal, iron ore, and grains, are projected for the years 1980, 1990, and 2000. The determination of the projected demands for the six commodities are based on the population and economic growth of the United States, Canada, Western Europe, and Japan. Demand, internal supply, and imports are projected for the United States consumption of petroleum, aluminum raw materials and iron ore, and the movement of each is traced from its source of origin to its final destination through United States' deepwater ports. Intra-United States movement of these commodities is also examined. Demand, internal supply, and exports of food and feed grains, soy beans, meals, phosphate rock and bituminous coal are also projected and their shipment traced. The sensitivity of each of these projections is discussed relative to changes in technological, economic, and political factors. The potential impact of mainland China's increased activity in the world markets is also evaluated, particularly its prospects for grain import requirements and coking coal exports. Reconnaissance surveys of United States port facilities, coastal areas, and ports are provided for the north Atlantic coast, including Maine through Virginia, the south Atlantic coast, including North Carolina through the Atlantic coast of Florida, the Gulf coast of Florida through Texas, the south Pacific coast including California, and the north Pacific coast including Oregon and Washington. Embraced in the surveys are general descriptions of the physical characteristics of the coastlines and the major harbors showing water depth, distance contour lines of 60, 90, and 120 feet, and longitudinal cross sections of major channels from the major facilities to a depth of 120 feet. Descriptive information is also provided on docking and commodity handling facilities within the ports, their physical design, and constraining features which might limit the form of future development within major harbors and channels. 1968-69 imports and exports, and 1969 intracoastal transfers data are also provided by port for crude petroleum and petroleum products, iron ore, alumina, bauxite, coal, phosphate rock, food and feed grain, soybeans, and soybean meal. EXPLORING ENERGY CHOICES.
Energy Policy Project, Washington, D.C.
Available from The Energy Policy Project, P O Box 23212, Washington, D.C. 20024, Price $0.75. Ford Foundation Energy Policy Project Preliminary Report, Washington, D.C., 1974. 81 p, 13 fig, 3 tab, 3 append.

Descriptors: *Energy, *Water resources, *Water pollution, *Water demand, Nuclear energy, Thermal powerplants, Water utilization, Oil fields, Coal mines, Electric power, Electric power demand, Planning, Regulation
Identifiers: *Energy supply and demand

The gap between domestic energy consumption and domestic production emerged in the 1950's and has grown rapidly since 1970. Three descriptive scenarios of the future are presented to show the range of feasible energy consumption patterns from which the nation can choose. These scenarios differ in their impacts on availability of energy supply, the environment, foreign policy, life styles, and the economy. One scenario is based on the persistence of present growth trends, another is a technical fix solution, which maintains the same growth in energy services, but stresses policies needed to reduce growth in energy use; a zero energy growth scenario would require changes in both life styles and the economy to reach a steady no-growth state. Water scarcity is a major factor limiting the development of coal industries in the West. While there may be adequate water for mining and rehabilitation of many areas, there is not enough water available there for large-scale operations. A pollution problem is acid mine drainage. A potential for oil spills exists in drilling and recovery operations on the Continental Shelf, in transporting Alaskan oil, and in importing oil. Oil shale development also raises serious environmental problems. Large amounts of water would be needed for commercial operations in a region where water resources are limited. Nuclear risks are qualitatively very different from those of fossil fuel systems. Like coal- and oil-fired plants, nuclear plants produce thermal pollution, but in their day-to-day operation they produce no air pollution. (Knapp-USGS)

PRODUCTION FUNCTION THEORY AND THE OPTIMAL DESIGN OF WASTE TREATMENT FACILITIES,
Krannert Graduate School of Industrial Administration, Lafayette, Ind.
J. R. Marsden, D. E. Pingry, and A. Whinston.
Applied Economics, v 4, p 279-290, 1972. 8 ref. OWRR A-024-IND(2).

Descriptors: *Waste water treatment, *Planning, *Decision making, *Optimization, Activated sludge, Trickling filters, Aeration, *Treatment facilities.
Identifiers: *Production functions, *Cost functions, Non-linear programming.

The theoretical production framework of the current study is compared with that of predecessors. Then the development of theoretical micro-production and cost functions for water treatment plants is considered. Much of the previous work dealing with the development of production functions fail to comply with the concepts set forth by R.W. Shepard. Several papers begin with a hypothetical production functional form which is then fit to some set of empirical data. The assumptions of efficiency and cost-minimization are generally imposed in what are treatises on the technological level currently employed. An alternative approach is presented which obviates the need for the above assumptions - an approach which is more appropriate for planning purposes than the conventional descriptive procedures. The importance and usefulness of efficient production processes is emphasized. A production function is not related to what people do, but rather is a function relating inputs to outputs summarizing efficient production methods (Wiersma-Indiana)

A CHART OF NEW YORK WATER LAW,
Cornell Univ., Ithaca, N.Y. Dept. of Natural Resources
R. Kasvinsky, and J. B. Bughan
Available from the National Technical Information Service as PB-231 373, $4.00 in paper copy, $1.45 in microfiche. A.E. Ext. 598, Dept. of Agricultural Economics, Cornell University, Ithaca, N.Y., Technical Report 32, October 1971. OWRR A-027-NY(1). 14-01-0001-1852

Descriptors: *New York, *Water law, *Water rights, *Charts, *Riparian rights, Riparian waters, Governments, Groundwater, Surface waters, Percolating water.

The law affecting private water rights in New York State is summarized briefly in the form of a chart. The chart divides the water-affecting law via distinctions concerning the actual nature of the water involved, i.e., water flowing in a defined channel (watercourses - surface and underground streams and lakes) and water not flowing in a defined channel (diffused surface water, percolating underground water). Discussed in a substantial introduction to the chart are the two sources of New York State Water Law, the common law and statutory law; considered also is the limitation of Government removal of water rights for public purposes from private property owners. The material provided in the chart attempts to be as thorough as possible, but it is not absolutely complete or definitive owing to the unstable, changing nature of the law in this area. Many nuances and exceptions have been excluded. The chart represents only a general guide and should be substituted for professional legal counsel in case of a legal controversy. (Bell-Cornell)

THE ENVIRONMENTAL IMPULSE AND ITS COMPETITORS: ATTITUDES, INTERESTS, AND INSTITUTIONS AT LAKE TAHOE,
California Univ., Davis. Dept. of Political Science.
E. Costantini, and K. Hanf.
Available from NTIS as PB-231 487 $4.00 microfiche $1.45. Institute of Governmental Affairs Research Report No. 29, October 1973, 85 p, 11 tab, 4 ref, (California Water Resources Center Project UCAL-WRC-W-299), OWRR-A-037-CAL(3).

Descriptors: *California, *Environmental effects, *Decision making, Constraints, *Political constraints, *Institutions, Psychological aspects, Attitudes, Social values.
Identifiers: *Lake Tahoe(Calif).

Inevitably, the question of what constitutes unacceptable environmental conditions is a political one: Environmental policy cannot be an irresistible, simple, unchallenged response to empirical or scientific fact alone. No matter how weighty the evidence of degradation may be, the environmen-

tal impulse inevitably competing, perhaps stronger, impulses. As a consequence, what constitutes unacceptable environmental conditions and what to do about them are political questions, for it is in the political process that disagreement over significant social values and conflicting interests finds expression and seeks some form of resolution. Two central ingredients of that process are considered: First, the attitudes and backgrounds of persons critically affecting environmental decision-making in the Tahoe Basin, and second, the framework of political institutions within which decisions regarding the Basin are made. In particular, the extent to which these institutions have been responsive to the values of environmental quality, is examined. The objective is to explore the relationships between political institutions and institution building at Tahoe on the one hand, and the environmental impulse and its competitors on the other. THE LAW TO GOVERN DEEPSEA MINING UNTIL SUPERSEDED BY INTERNATIONAL AGREEMENT,
J. G. Laylin.
San Diego Law Review, Vol 10, No 3, p 433-445, May 1973. 15 ref.

Descriptors: *Resource allocation, *Resource development, *Mining engineering, *Engineering geology, *Ownership of beds, Continental shelf, Marine geology, Law of the sea, Oceans, Jurisdiction, Legislation.
Identifiers: Deepsea mining, Seabed.

There presently is no international law limiting freedom to recover mineral resources of the seabed beyond coastal state jurisdiction, nor is there any United States statutory or common law limitations. Pending the adoption of an international regime under the multi-lateral convention that the United Nations Seabed Committee is seeking to bring about, the United States can, by legislation, regulate deep seabed mining by all of its citizens and companies to promote conservation and orderly development of hard mineral resources on the deep seabed. Such legislative regulation is advocated, since the prospects for an international pact in the near future are dim. It is desirable that states having the capability to carry on mining put restraints upon themselves that encourage activity but do not permit assertion of rights beyond those necessary to assure progress, equity and order in ocean development. Legislation now before Congress provides for licensing of American mining activities beyond the continental shelf. Such legislation should include, a provision for reciprocity with other nations enacting similar legislation. (Flowers-Florida)

RECENT DEVELOPMENTS IN THE LAW OF THE SEA IV: A SYNOPSIS,
G. D. Greenblatt, J. R. Miller, and A. J. Waldchen.
San Diego Law Review, Vol 10, No 3, p 559-598, May 1973. 101 ref.

Descriptors: *Fish conservation, *Commercial fishing, *Foreign waters, *Law of the sea, International waters, Judicial decisions, Oil exploration, Water resources, Water resources development, Fish harvest, Pacific Ocean, Boundary disputes, Oil industry, Jurisdiction, Oceans, Atlantic Ocaen.
Identifiers: *Territorial waters, *Seabed resources, *Sovereignty, *International agreements, *Coastal waters, Comparative law.

A synopsis is presented of important events pertaining to the law of the sea during the last two years. The President's message to Congress is discussed along with the internationally sanctioned reduction in whale kill, the salmon fishing curb in Canada, and other fisheries acts for control, conservation, and research and development. Many fishing agreements are recounted such as those between Peru and the Soviet Union, Chile and the Soviet Union, and Japan and the United States. Legislation was also passed to develop tuna resources. This was spurred by Ecuadorian and Peruvian seizures for alleged invasions of their claimed two hundred mile territorial limit. An Alaskan fishing law was upheld in the face of a Constitutional attack. The law prohibited the use of a power drum to bring in cast nets in Alaskan territorial waters. The court found a compelling state interest in the conservation of salmon. Seabed resources are also discussed with particular attention to new oil leases and exploration. Attempts to protect shipping by avoiding incidents on the high seas as well as extensions of sovereignty by extending territorial waters are also discussed. (Sperling-Florida)

SEAMOUNTS AND GUYOTS: A UNIQUE RESOURCE,
S.K. Eaton, Jr., and J. Judy.
San Diego Law Review, Vol 10, No 3, p 599-637, May 1973. 129 ref.

Descriptors: *Geology, *Law of the sea, *International waters, *Marine fishery, *Engineering geology, Foreign waters, Terrain analysis, Research and development, Weather forecasting, Fish handling facilities, Commercial fishing, Communication, Marine geology, Oceans.
Identifiers: *Seamounts, *Guyots, *Sovereignty, *Seabed resources, International agreements, International regime.

The potential of the seabed as a source of natural resources is discussed. Recent advances in technology have made possible exploration of the deep seabed. This exploration has fostered concern for the establishment of a legal regime for regulation of the ocean floor. The necessity for such regulation is due to the fact that existing International Law principles do not or cannot apply to the seabed beyond national jurisdiction. The 1973 Conference on the Law of the Sea will attempt the formulization and adoption of an integrated plan, to exploit and develop ocean resources for the benefit of mankind as a whole. Seamounts and guyots, their legal status under international law, and the possible uses to which these phenomena may be put are described. Discussed as possible uses are: military utilization, mineral resource development, transportation, fishing, communications, weather forecasting, and expansion of territory. Alternate proposals to the formation of an international regime are also discussed. (Sperling-Florida)

WHATEVER HAPPENED TO TVA,
G. Young.
National Geographic, Vol 143, p 831-863, June 1973. 1 map, 10 photo.

Descriptors: *Tennessee Valley Authority, *Tennessee River, *Management, *Nuclear energy, *Environmental control, Environmental effects, Tennessee, Strip mines, Coal, Water resources development, Recreation, Multiple purpose projects, Mussels, Fertilizers, Hydroelectric plants.

The entire countryside surrounding the Tennessee Valley Authority (TVA) project is examined, seeing what it has done and what it has meant to the people. A short history of TVA is presented. The cries of socialism during the 1930's and the Manhattan Project and the atom bomb of the 1940's are described. Throughout both of these periods as well as now, the purpose of the program is to generally upgrade life surrounding the area. The

project now is concerned with peaceful uses of the atom in nuclear power, and environmental programs concerning land-management and water-quality studies. One such program especially noted is the Rapid Adjustment Farming Program which helps farmers specialize in the crops and livestock that best fit their needs and land. The manner in which TVA has helped to better utilize the surrounding recreational facilities and research on the development of fertilizer are described. As TVA represents the largest coal consumer in the United States, the new problem is the environmentalists and their assertion that TVA is doing far too little to prevent strip miners from leaving ugly gashes on the land. While admitting this to some extent, TVA directors say they do realize the problems and recently have begun to do more about it. (Sutton-Florida)

DRAINAGE DISTRICTS.
N.C. Gen. Stat., sec. 159-69, p 227-228 (1973).

Descriptors: *North Carolina, *Legislation, *Surveying, *Mapping, *Drainage districts, State governments, Adoption of practices, Drainage patterns, Irrigation canals, Irrigation ditches, Bench marks, Data collections, Terrain analysis, Evaluation, Laterals, Outlets, Water management(Applied), Land management, Watercourses, Ditch, Channel, Administration, Engineering structures, Regulation.
Identifiers: *Administrative regulations.

This statute provides for the survey of drainage districts. Each drain, lateral drain, ditch, and levy shall be marked on the ground. Also, the course and distance of each ditch is to be mapped. If an old watercourse, ditch, or channel is being widened, deepened, or straightened, the cross-section will be accurately determined. The board of viewers will consider the effect of the proposed improvements upon the habitat of fish and wildlife. The need for and feasibility of structures to control the flow of water, to impound or store water, and to provide areas for the conservation and replacement of fish and wildlife habitat will be considered by the board. If structures are to be recommended, the report will include specifications, the location of the structure, and the estimated cost. The report will also set forth the areas of land needed for construction and maintenance of the canals and drainage system and structures to control, impound, or store water as well as fish replacement and will also include on whose land such areas are located, and the area of land necessary to be acquired from each landowner. (Sperling-Florida)
W74-06972

GROUNDWATER USE ACT OF 1969.
S.C. Code Ann., secs. 70-31 through 70-42 (1969).

Descriptors: *South Carolina, *Legislation, *Groundwater, Consumptive use, Aquifer, Water, Water law, Water resources, Water utilization, Legal aspects, Regulation, Permit, Non-consumptive use, Penalties(Legal), Underground streams, Subsurface waters, Water table, Water sources.
Identifiers: Injunctive relief.

The water resources of the state of South Carolina shall be put to beneficial use to the fullest extent possible, subject to reasonable regulation in order to conserve and develop these resources. The South Carolina Water Resources Planning and Coordinating Commission is authorized to develop capacity use areas in any area where aggregate uses exceed or threaten to impair the renewal or replenishment of waters in that area. The Commission shall then prepare regulations governing the use of groundwaters in the area to prevent untimely withdrawals and saltwater intrusion as well as provisions governing well depth and spacing controls. In such areas no person shall withdraw in excess of one hundred thousand gallons per day without a permit from the Commission. Penalties for violations of provisions of this statute are contained therein, and the Commission is empowered to obtain injunctive relief when necessary. (Ritchie-Florida)
W74-06973

DIVISION OF WATER: POWERS AND DUTIES.
Ohio Rev. Code Ann. secs 1521.03 (Supp. 1972).

Descriptors: *Ohio, *Groundwater recharge, *Water resources, Water resources development, Watershed management, Flood control, Drainage systems, Flood protection, Flood proofing, Water pollution control, Legislation, Regulation, Conservation, Construction, Research and development, Governments, Administration, Administrative agencies.
Identifiers: *Administrative regulations.

The division of water shall play an advisory role in any watershed district, soil conservation district, county, municipal corporation, or other agency of the state of Ohio in the planning of works for ground water recharge and water conservation practices. This division has authority to inventory water and related resources in each drainage basin in the state, and to formulate a plan which recognizes the variety of uses to which water may be put and the need for its retention and control. It can also investigate and study all factors relating to floods and flood control with particular attention to maintenance of the efficiency of the channels of rivers, streams, and watercourses as a means of carrying off flood waters. The division's aid can also be enlisted in planning and constructing flood control works. (Sperling-Florida)
W74-06974

POWERS OF THE WATER POLLUTION CONTROL BOARD: POWERS OF DIRECTOR OF ENVIRONMENTAL PROTECTION.
Ohio Rev. Code Ann. sec 6111.03 (Supp. 1972).

Descriptors: *Ohio, *Waste disposal, *Water pollution control, Legislation, Water pollution, Pollution abatement, Water quality control, Standards, Regulation, Wastes, Sewage disposal, Permits, Construction, Governments, Administrative agencies, Supervisory control(Power).
Identifiers: *Administrative regulations, Injunctive relief, Licenses.

The director of environmental protection has power to develop plans and programs for the prevention, control, and abatement of new or existing pollution of the waters of the state of Ohio. The director also has the power to encourage and participate in investigations related to water pollution. He can require the construction of new disposal systems as well as modification of existing systems. The director can issue, revoke, or deny permits and specify conditions for the discharge of sewage, industrial waste, or other wastes. The director can also institute proceedings to compel compliance with his orders. (Sperling-Florida)
W74-06975

INDUSTRIAL DEVELOPMENT--POLLUTION.
Mich. Comp. Laws Ann. sec 125.1253a (Supp. 1973), as amended, act 7, sec 1 (1973) Mich. Pub. Acts.

Descriptors: *Michigan, *Air pollution, *Water pollution, *Legislation, *Water law, *Water pollution abatement, *Water pollution control, *Financing, Cities, Public utilities, Industries, Industrial wastes, Water pollution sources, Equipment, Abatement, Public health, Pollution abatement, Air, Water.

To protect the public health, safety and welfare of the residents of Michigan, there is a continuing need for water and air pollution control for industries and public utilities. It is thus necessary that these industries and public utilities acquire, construct, refurbish, enlarge and repair the operation and maintenance of adequate and proper equipment to control air and water pollution. This act confers the authority and power to municipalities to acquire, construct, improve, enlarge and maintain such necessary facilities, to issue revenue bonds to finance such acquisitions and improvements, to enter into lease or lease purchase agreements regarding such equipment and to sell any such equipment. The interest of the municipality in the water and air pollution control equipment may be made subject to a mortgage, lien, security interest or encumbrance given by a public utility from which the municipality acquired its interest. (Silber-Florida)
W74-06976

CLEANING AGENTS.
Mich. Comp. Laws Ann. secs. 323.231-323.236 (Supp. 1973).

Descriptors: *Water pollution, *Legislation, *Michigan, Detergents, Phosphorus, Legislation, Water resources, Algae, Weeds, Aquatic week control, Slime, Environmental effects.

The content of cleaning agents is restricted in order to protect water quality by preventing and controlling growth of algae, weeds and slimes. Cleaning agents which contain phosphorus in any form in excess of 8.7% by weight are prohibited. The Michigan water resources commission promulgates rules for this clean agents act. The rules may further provide restriction of nutrient content and other contents of cleaning agents and water conditioners, to prevent unlawful pollution and control nuisance growths of algae, weeds and slimes which are or may become injurious to other lawful water uses. A person is prohibited from selling detergents or cleaning compounds containing any substance other than phosphorous that may cause unlawful pollution of the waters when discharged thereto. The water resources commission shall enforce this act and seek court enforcement of its orders. (Daniels-Florida)
W74-06977

SEWER CONSTRUCTION.
Mich. Comp. Laws Ann. secs. 323.412 (Supp. 1973).

Descriptors: *Legislation, *Michigan, Construction, Sewerage, Structures, *Water pollution control, Economics, Budgeting, Legal aspects, Sewage treatment, Sewage.

Procedures are outlined for applications for collecting sewer construction grants. The construction grants projects are to be certified by the Director of the Michigan Department of Administration and the State Treasurer. The Michigan Water Resources Commission shall report to the Legislature the collecting sewer projects eligible for grants, the points and priorities assigned to them pursuant to this Act and a list of projects that are recommended to be funded. (Daniels-Florida)
W74-06978

SEWAGE TREATMENT FACILITIES, STATE GRANTS.
Mich. Comp. Laws Ann. secs. 323.112, 323.113, 323.113a, 323.125, 323.126 (Supp. 1973).

Descriptors: *Water pollution control, *Sewage treatment, Construction, *Michigan, Environmental effects, Legislation, Grants, Projects, Water resources development, Governmental interrelations, Economics, Budgeting.

The Michigan state sewer construction fund is transferred to the water pollution fund. Disbursements from the water pollution control fund are provided for specific eligible treatment works projects. The eligible projects for a federal grant can receive a state grant up to 25% of construction costs for the treatment project. Disbursements from the fund shall be made by the Director of the Department of Administration and the state treasurer. Grants and advances to local agencies shall be funded from the State Water Pollution Control Fund for treatment works projects in descending order of their priority as established by the Water Resources Commission until all projects which have been approved have been funded. (Daniels-Florida)
W74-06979

SEWAGE COLLECTION FACILITIES.
Mich Comp Laws Ann, sec 123.192, 123.193 (Supp 1973).

Descriptors: *Michigan, *Sewerage, *Sewage disposal, *Wastes, *Domestic wastes, Sanitary engineering, Sewage treatment, Water pollution sources, Pipelines, Sewage sludge, Wastewater disposal, Sewage effluents, Legislation, State governments.

Section 123.192 provides that any property from which sanitary sewage emanates must be connected to a public sewage collection facility within eighteen months of the occurrence of the last of the following events: (1) availability of a public facility; (2) improvement of the property so as to become property from which sewage emanates; (3) this act's effective date. A new addition to the statute gives municipalities the power to require connection in a shorter time, but not less than six months. Section 123.193 provides that if any property is not connected within the time periods set out above, the owner or operator of the nearest available facility shall require connection forthwith, by written demand mailed to the record owner of the property and posted beside an entrance to the property. The demand must give the location of the nearest collection facility and advise the owner of the other requirements of the statute. (Flowers-Florida)
W74-06980

REGIONAL WATER AND SEWER DISTRICTS: RIGHTS, POWERS AND DUTIES.
Ohio Rev. Code Ann. sec. 6119.06 (Supp. 1972).

Descriptors: *Ohio, *Flow measurement, *Flow rates, Flow augmentation, Flow profiles, Public health, Planning, Natural resources, Water pollution control, Regulation, Conservation, Construction, Administrative agencies, State governments, Sewage districts, Water districts.
Identifiers: *Administrative regulations.

The regional water and sewer districts may make loans or grants to political subdivisions for the construction of water resource projects. They may also acquire, reconstruct, enlarge, equip, maintain, repair, or rent water resource projects. The districts may adopt regulations to protect augmented flow in waters of the state of Ohio from depletion so it will be available for use by the public. It can change or remove any building or structure to carry out its objectives. The owner of any premises in the district can be required to connect his premises to a water resource project as to prevent or abate pollution or protect the health and property of persons in the district. (Sperling-Florida)
W74-06981

WATER POLLUTION--SUMMER INTERN PROGRAM.
Ch. 79 (1973) Laws of New Jersey, to be enacted as, N.J. Stat. Ann., ch. 13:1D-20 to 13:1D-28.

Descriptors: *New Jersey, *Legislation, *Water pollution, *Financing, *Programs, *Pollution abatement, Budgeting, Surveys, Data collections, Measurement, Monitoring, Streams.

The New Jersey legislature has declared as a state goal the elimination of all pollution and polluting substances from the state's waters. The legislature has thus appropriated $100,000 to the Department of Environmental Protection for the purpose of employing college students during the summer months to aid in cleaning those waters. Summer interns will be assigned to such projects as making surveys of all places where polluting materials are entering streams, providing water sampling and monitoring activities, desnagging and removing debris, and performing any other projects designed to carry out the intent of this act. Any New Jersey resident enrolled full-time in any college or university may apply as an intern provided he has completed his freshman year of schooling but has not completed his final year of college. The program shall be administered by the Director of the Division of Water Resources in the Department of Environmental Protection. (Ritchie-Florida)
W74-06982

DRAINAGE.
N.Y. Sess. Laws, Ch. 664, secs. 15-1901 through 15-1983 (McKinney 1972).

Descriptors: *New York, *Drainage, *Drainage districts, *Agriculture, Legislation, Structures, Construction, Public health, Petitions, Projects, Agricultural runoff, Financing.
Identifiers: Drainage systems.

This statute gives the New York (drainage improvement) department powers and duties herein described with respect to drainage. The purpose is to provide for the drainage of agricultural land so that it can be more productive in order to benefit the public health, safety and welfare. The statute sets up drainage improvement districts and associations which represent the interests of its members in drainage matters. To carry out surveys and examinations, the department may enter upon any lands, structures and waters as necessary. Procedures have been established for petitions, district formation, enhancements, authorization for construction, financing of projects, assessment and collection of cost, and for discontinuance of the districts. All work is to be done by contract and the department should prepare the contracts, plans and specifications for doing such construction and furnishing the necessary materials. The care, operation and maintenance of the drainage works is subject to the control and supervision of the department. (Daniels-Florida)
W74-06983

RIVER V. RICHMOND METROPOLITAN AUTHORITY.
359 F. Supp. 611-643 (E.D. Va. 1973).

Descriptors: *Judicial decisions, *Rivers and Harbors Act, *Navigable waters, *Environmental effects, *Highways, Construction, Legislation, *Virginia, Environment, Permits, Drainage, Navigation, Transportation, Canals, Roads, Governments, Social aspects, Natural resources.
Identifiers: Injunctive relief, National Environmental Policy Act(NEPA), Navigation obstructions, *Richmond(Va).

A nonprofit corporation brought an action against state and federal authorities for injunctive relief with respect to proposed construction of a limited access expressway in the downtown area of Richmond, Virginia. Plaintiffs in one count alleged that because the proposed expressway requires encroachment upon navigable waters, the defendants must apply, pursuant to the Rivers and Harbors Act of 1899, to the Corps of Engineers for a construction permit. The court did not determine the desirability of the expressway but rather the applicable law. The protection of the environment is of utmost importance and the decision to protect it is up to Congress. The court held that the river and canal which was drained and filled did not constitute navigable waters for the purpose of determining whether the proposed construction would be violative of the sections of the rivers and harbors act, relating to approval for construction of any bridge or causeway over navigable water. Summary judgment motion for defendant was granted. (Daniels-Florida)
W74-06984

LEGAL IMPEDIMENTS TO THE USE OF INTERSTATE AGREEMENTS IN COORDINATED FISHERIES MANAGEMENT PROGRAMS: STATES IN THE N.M.F.S. SOUTHEAST REGION,
Louisiana State Univ., Baton Rouge. Law School.
H. G. Knight, and T. V. Jackson.
September 28, 1973. 120 p, 140 ref.

Descriptors: *Southeast U.S., *Research and development, *State governments, *Coordination, Adoption of practices, Legislation, Fish conservation, Fish establishment, Fish management, Commercial fishing, Estuarine fisheries, Saline water, Fish, Water resources development, Coasts, Judicial decisions, Governments, Political aspects, Interstate commissions, Governmental interrelations.
Identifiers: Coastal zone management.

The purpose is to identify and analyze existing impediments to coordinated interstate fisheries management agreements among coastal states in the Southeastern United States. Another purpose is to identify and analyze alternative methods for developing a system of coordinated fisheries management among those states. This study is limited exclusively to marine fisheries and does not cover fresh water fishery management problems; however, much of the study is equally applicable in fresh water fisheries. The coastal fisheries management systems of each of the eight states in the Southeast are included. Discussions were conducted with each of the resource managers and attorneys of the states to gain a better understanding of the state's coastal fishery management system and seek new ideas and comments relating to the use of interstate agreements in coastal fisheries management programs. Research was also directed to the broader implications of the study such as the general use of interstate agreements and the requirement of Congressional consent to interstate agreements. (Sperling-Florida)
W74-06991

LEGAL AND ADMINISTRATIVE ASPECTS OF AN AQUACULTURE POLICY FOR HAWAII, AN ASSESSMENT,
Hawaii State Dept. of Planning and Economic Development, Honolulu.
G. M. Trimble.
Available from the National Technical Information Service as PB-220 186. Western Interstate Commission for Higher Education report, December, 1972. 61 p, 1 tab.

Descriptors: *Hawaii, *Aquiculture, Agriculture, Effluents, Laboratory tests, Fisheries, Commercial fishing, Fish management, Research and development, Water rights, Water quality, Water quality standards, Coasts.

This assessment is the first of a series to be undertaken to provide recommendations for Hawaii decision makers. Findings are based on project results and recommendations are based on literature searchers, interviews, questionnaires and a one day structured Assessment Workshop. The project resulted in studies of ancient Hawaiian konohiki fishing rights, kuleana water rights, and fish pond cultures of mullet and milk fish, showing that they are compatible with the development of modern aquaculture in Hawaii. Most of the forthcoming needs of commercial aquaculture development in Hawaii can be adequately handled by administrative or regulatory action. In the near future aquaculture in Hawaii is most likely to occur on agricultural lands or at inland locations where no effluent discharge occurs. Hawaii's present institutional structure supports laboratory research and commercial operations, and it is unlikely that incentives to commercial enterprise to undertake long term research and development in aquaculture will succeed. There is a need for commercial identification and quality standards to insure high-quality aquaculture products, thereby enhancing customer acceptance. Included is a bibliography containing thirty-eight sources. (Sears-Florida)
W74-06992

RATIFICATION OF PROPOSED CONVENTION ON THE PREVENTION OF MARINE POLLUTION BY DUMPING OF WASTES AND OTHER MATTER (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Department of State, Washington, D.C.
Available from National Technical Information Service, U.S. Dept of Commerce, Springfield, Va, as EIS-AA-73-0177-F. PC $10.00, microfiche $1.45. January 1973. 160 p, 2 tab.

Descriptors: *United States, *Environmental effects, *International law, *International waters, *Governmental interrelations, Federal government, Legislation, Political aspects, Foreign waters, Law of the sea, Commercial fishing, Water pollution, Oceans, Ocean circulation, Coasts, Pollutants.
Identifiers: *Environmental Impact Statements, *Coastal waters.

The action under consideration is the ratification by the United States of a convention developed at a governmental Conference. It would prohibit all deliberate disposal at sea from vessels and aircraft of certain dangerous substances, and require permits for the dumping of other substances in accordance with detailed criteria. All coastal states bordering upon the high seas would be particularly affected by the action under consideration. The convention would hopefully stimulate other nations to abide by procedures and standards for ocean dumping that are in general harmony with those contemplated in the U.S. Marine Protection, Research and Sanctuaries Act of 1972. Alternatives include reliance solely on domestic laws, expansion of the subject convention to cover other forms of marine pollution, and U.S. participation in a regional rather than a global ocean dumping convention. THREE-YEAR EVOLUTION,
C. G. Ash.
Water Spectrum, Vol 5, No 4, p 28-35, 1973. 4 photo, 2 fig, 1 chart.

Descriptors: *Environmental effects, *Environmental engineering, *Balance of nature, *Federal project policy, *Inter-Agency Comm. on Water Resources, *Water resources development, Feasibility studies, Project planning, Federal government, Administrative agencies, Project purposes, Water policy, Water conservation, Ecology, Land conservation, Inter-agency cooperation.
Identifiers: *National Environmental Policy Act, *Environmental impact statement.

The environmental impact statements required by the National Environmental Policy Act (NEPA) and the changes which have occurred during the past three years are described. The evolution reflects new approaches to resources and their use and new concepts in planning. In retrospect, there appear to be three distinct phases which the implementation of NEPA has gone through. The first phase, or period of interpretation, was characterized by much speculation but little action. In the second phase, the procedural phase, the emphasis was placed on adhering to the letter of the law. The third phase is termed the integrated planning phase. Under this third stage concept, adherence to NEPA for a particular project requires the examination of a least three separate Corps of Engineers documents. Statements prepared recently generally meet the full disclosure concepts of NEPA and relate the activities involved to environmental impacts at various stages of project completion. The use of matrix factors in determining environmental effects and the disadvantages of this method are described. The procedure in both the pre- and post-authorization stages is outlined. A SIMPLE AUTOMATIC SOIL PERCOLATOR,
Hawaii Univ., Honolulu.
K. P. Goswami, and K. P. Green.
Soil Biol Biochem. Vol 3, No 4, p 389-391. 1971, Illus.
Identifiers: *Automatic equipment, *Soil percolator, Apparatus.

The apparatus differs from those previously described in the manner in which small volumes of solution are introduced into the lift tube which delivers solution to the tops of a soil column. An inverted glass 'y-joint' submerged in the reservoir solution allows alternate increments of air and solution to proceed up the lift tube without adjustment of tubing and liquid levels.--Copyright 1973, Biological Abstracts, Inc.

UNIQUE CHARACTERISTICS OF ERTS,
Geological Survey, Washington, D.C.
A. P. Colvocoresses.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1523-1525, 1973.

Descriptors: *Remote sensing, Satellites(Artificial), *Data collections, Radiation, Wavelengths, Mapping, Surveys, Monitoring, Geologic mapping.
Identifiers: *ERTS.

ERTS-1 has unique characteristics or advantages in the electronic transmission (TV) earth-sensing system for the mapmaker. ERTS-1 may survive for 2 or more years and thus provide repetitive as well as complete coverage, making the most of only one launch, spacecraft, and instrument package. ERTS is proving that imagery can be electronically transmitted without serious distortion. The field of view of the ERTS MSS extends only 5.76 deg from the nominal vertical. The ERTS signals, particularly those of the MSS, are in effect those of a focusing radiometer, recording radiated energy with a range and precision well beyond the capability of any current film system. MSS band 7, at 0.8 to 1.1 microns, has opened a window for remote sensing for which operational film systems do not have a capability. Geologists and others are selecting MSS 7 as the best single band for depicting the earth's physiographic structure. (See also W74-06619) (Knapp-USGS)

RELATIONSHIPS BETWEEN REMOTELY SENSED FISHERIES DISTRIBUTION INFORMATION AND SELECTED OCEANOGRAPHIC PARAMETERS IN THE MISSISSIPPI SOUND,
National Marine Fisheries Service, Pascagoula, Miss. Southeast Fisheries Center.
A. J. Kemmerer, and J. A. Benigno.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1685-1695, 1973. 2 fig, 5 tab, 6 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Fisheries, Oceanography,

Chlorophyll, Turbidity, Algae, Gulf of Mexico, Data collections, Data processing.
Identifiers: *ERTS, *Mississippi Sound.

A feasibility study to demonstrate the potential of ERTS for providing fisheries significant information was conducted in the Mississippi Sound and adjacent offshore waters. Attempts were made to relate satellite-acquired imagery to selected oceanographic parameters and then to relate these parameters to aircraft remotely sensed distribution patterns of resident surface schooling fishes. Initial results suggest that this approach is valid and that the satellite-acquired imagery may have important fisheries resource assessment implications. (See also W74-06619) (Knapp-USGS)

ADVANCED SCANNERS AND IMAGING SYSTEMS FOR EARTH OBSERVATIONS.
National Aeronautics and Space Administration, Greenbelt, Md. Goddard Space Flight Center.
Available from Sup Doc, GPO, Washington, D C 20402, Price $3.90. Report SP-335, 1973. 604 p.

Descriptors: *Remote sensing, *Satellites(Artificial), Infrared radiation, Photography, Data transmission, Meteorology, Water resources, Data processing, Crops, Ice, Sea ice, Mapping, Geomorphology, Geology, Monitoring.

The Advanced Imagers and Scanners Working Group met at Cocoa Beach, Florida from December 11 to 15, 1972. The meeting addressed sensors, sensors systems and user applications for remote monitoring of the earth from orbiting satellites. The Working Group limited itself to consideration of electromechanical scanners and electronic imaging systems for the spectral region including the visible through the thermal infrared. The use of photographic cameras and film was addressed only briefly, and microwave imaging was excluded. In addressing remote sensing technology and its applications, the Working Group was asked to consider the present and then project into a period both 4 and 8 years hence, the growth of technical capability and the expansion of requirements in terms of performance specifications. Both broad assessments of present and future sensors and sensor related technology, as well as a description of user needs and applications are provided. (Knapp-USGS)

SYMPOSIUM ON SIGNIFICANT RESULTS OBTAINED FROM THE EARTH RESOURCES TECHNOLOGY SATELLITE-1, VOLUME I: TECHNICAL PRESENTATIONS, SECTION B.
National Aeronautics and Space Administration, Greenbelt, Md. Goddard Space Flight Center.
GPO, Washington, DC 20402, Price $13.65 domestic postpaid or $12.50 GPO Bookstore per set (Sect A and B). Symposium held at Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, Section B, 851 p, 1973.

Descriptors: *Remote sensing, *Satellites(Artificial), *Mapping, *Surveys, *Monitoring, Land use, Geologic mapping, Terrain analysis, Water resources, Snow, Ice, Lakes, Glaciers, Management, Planning, Water resources development, Wildlife.
Identifiers: *ERTS.

The first Earth Resources Technology Satellite (ERTS-1) was launched on July 23, 1972. In the 7 months since it was activated, over 34,000 scenes of the earth have been obtained covering all major land masses and about 75% of the world's land area. Some areas, such as the United States, have been imaged at least 12 times. The purpose of this program is to provide an assessment of remote sensing from a satellite as a technique for inventorying and monitoring the earth's resources to provide better management of these resources. The quality of the products produced by the ERTS-1 system during its initial period of operations is, from a resolution and radiometric accuracy viewpoint, quite consistent with prelaunch estimates. In the geometric sense, these data products are somewhat better (and in a few cases considerably better) than prelaunch estimates. (See W74-01663 and W74-06620 thru W74-06711) (Knapp-USGS)
W74-06619

CARTOGRAPHIC QUALITY OF ERTS-1 IMAGES,
Georgia Univ., Athens.
R. Welch.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 879-886, 1973. 2 fig, 2 tab, 6 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Mapping, Surveys, Geologic mapping, Terrain analysis, Topographic mapping, Data collections, Data processing.
Identifiers: *ERTS.

Analyses of simulated and operational ERTS images provide initial estimates of resolution, ground resolution, detectability thresholds and other measures of image quality of interest to earth scientists and cartographers. Ground resolution is about 250 meters for both RBV and MSS systems. The ERTS-1 images appear suited to the production and revision of planimetric and photo maps of 1:500,000 scale and smaller for which map accuracy standards are compatible with the imaged detail. Thematic mapping, although less constrained by map accuracy standards, will be influenced by measurement thresholds and errors which have yet to be accurately determined for ERTS images. (See also W74-06619) (Knapp-USGS)
W74-06620

PROGRESS IN CARTOGRAPHY, EROS PROGRAM,
Geological Survey, McLean, Va.
A. P. Colvocoresses, and R. B. McEwen.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 887-898, 1973. 2 fig, 3 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Mapping, Surveys, Geologic mapping, Terrain analysis, Topographic mapping, Data collections, Data processing.
Identifiers: *ERTS.

Several cartographic applications of ERTS imagery are described. Revising line maps is one in which the image is not retained, but the other applications defined to date retain the image or a derivative of the image. Monochromatic orthophotos are normally derived from one spectral band and portrayed in gray tones. Colors may be assigned as a function of density, but the basic input is a single gray-tone image. Polychromatic orthophotos are the color image application; with ERTS, they normally give a false-color rendition that includes the near-infrared. Autographic theme extraction is a derivative application that isolates one or more basic themes, such as water, snow and ice, or infrared-reflective vegetation. (See also W74-06619) (Knapp-USGS)

W. A. Malila, and R. F. Nalepka.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1097-1104, 1973. 12 fig.

Descriptors: *Remote sensing, Satellites(Artificial), *Data processing, Data collections, Terrain analysis, Surveys, Mapping, Photogrammetry.
Identifiers: *ERTS.

Atmospheric effects in satellite multispectral scanner data can influence results obtained with either manual image interpretation or computer information extraction techniques. The atmosphere attenuates radiation arriving from the surface and adds an extraneous path radiance component. Empirical analyses of ERTS MSS data and simultaneous airborne MSS underflight data for one frame are compared. Theoretical calculations of atmospheric effects are discussed. The effect of limited spatial resolution on the accuracy of information extracted from ERTS data is important. Problems occur when individual resolution elements contain two or more materials. Results from an initial application of techniques for estimating proportions of materials within individual elements are presented and discussed. Very accurate determination of surface areas of small lakes is possible. (See also W74-06619) (Knapp-USGS)

DETERMINATION OF AEROSOL CONTENT IN THE ATMOSPHERE,
Science Applications, Inc., La Jolla, Calif.
M. Griggs.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1105-1113, 1973. 3 fig, 1 tab, 8 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Aerosols, *Data processing, *Climatology, Air pollution, Surveys, Pollutant identification.
Identifiers: *ERTS.

The feasibility of determining the aerosol content in the atmosphere from contrast measurements of ground features and from radiance measurements was studied using ERTS data. Theoretical relationships between aerosol content and contrast reduction and radiance were derived for ideal model atmospheres. Preliminary data analysis of the MSS transparencies is promising for determining the contrast-aerosol content relationship in the Salton Sea region. (See also W74-06619) (Knapp-USGS)

A TECHNIQUE FOR CORRECTING ERTS DATA FOR SOLAR AND ATMOSPHERIC EFFECTS,
Bendix Aerospace Systems Div. Ann Arbo, Mich.
R. H. Rogers, and K. Peacock.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1115-1122, 1973. 3 fig, 2 tab

Descriptors: *Remote sensing, Satellites(Artificial), *Data processing, *Solar radiation, *Albedo, Atmosphere, Surveys, Data collections.
Identifiers: *ERTS.

ERTS can be used to obtain absolute target reflectances by correcting spacecraft radiance measurements for variable target irradiance, atmospheric attenuation, and atmospheric backscatter. A simple measuring instrument and the necessary atmospheric measurements are described, and example demonstrate the nature and magnitude of the atmospheric corrections. (See also W74-06619) (Knapp-USGS)
W74-06648

EXPERIMENTAL MASKING OF RBV IMAGES TO REDUCE STATIONARY RESIDUAL INACCURACIES IN RADIOMETRIC CORRECTION,
International Imaging Systems, Mountain View, Calif.
D. S. Ross.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1123-1128, 1973. 2 fig, 1 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Data processing, *Calibrations, Photogrammetry, Mapping, Surveys, Data collections.
Identifiers: *ERTS.

ERTS-1 vidicon image scenes show stationary, repetitive residual inaccuracies in shading correction, large enough to affect qualitative and quantitative image analyses. Photographic masks designed to reduce residual shading were prepared from vidicon images of a relatively cloud-free ocean scene of uniform reflectance. When applied to other scenes, the masks enable more closely corrected RBV images to be printed. Illustrations are given of vidicon images before and after correction, compared with an equivalent MSS spectral image of the same scene. (See also W74-06619) (Knapp-USGS)
W74-06649

DIGITAL RECTIFICATION OF ERTS MULTISPECTRAL IMAGERY,
TRW Systems Group, Redondo Beach, Calif.
S. S. Rifman.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technology Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1131-1142, 1973. 8 fig, 2 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Data processing, *Calibrations, Surveys, Mapping, Photogrammetry, Terrain analysis, Digital computers, Data collections.
Identifiers: *ERTS, Image enhancement.

Rectified ERTS multispectral imagery is produced, utilizing all digital techniques, as the first step toward producing precision corrected imagery. The resultant image is mapped utilizing an intensity resampling technique. Negligible degradation of the photometric and resolution properties of the source data is caused by the geometric correction process. (See also W74-06619) (Knapp-USGS)
W74-06650

RESULTS OF PRECISION PROCESSING (SCENE CORRECTION) OF ERTS-1 IMAGES USING DIGITAL IMAGE PROCESSING TECHNIQUES,
IBM Federal Systems Div., Gaithersburg, Md
R. Bernstein
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1143-1150, 1973. 1 fig, 4 tab, 4 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Data processing, *Calibrations, Surveys, Mapping, Photogrammetry, Terrain analysis, Digital computers, Data collections.
Identifiers: *ERTS, Image enhancement.

ERTS-1 MSS and RBV data recorded on computer compatible tapes were analyzed and processed. No degradation of intensity (radiance) information occurred in implementing the geometric correction. The quality and resolution of the digitally processed images are very good, due primarily to the fact that the number of film generations and conversions is kept to a minimum. Processing times of digitally processed images are about equivalent to those of the electro-optical processor. (See also W74-06619) (Knapp-USGS)
W74-06651

SIGNIFICANT TECHNIQUES IN THE PROCESSING AND INTERPRETATION OF ERTS-1 DATA,
Lockheed Electronics Co., Inc., Houston, Tex. Houston Aerospace Systems Div.
S. B. Cousin, A. C. Anderson, J. F. Paris, and J. F. Potter.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1151-1158, 1973. 10 fig, 6 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Data processing, *Calibrations, Surveys, Mapping, Photogrammetry, Terrain analysis, Digital computers, Data collections.
Identifiers: *ERTS, Image enhancement.

Investigations using ERTS-1 data provide an appropriate framework for the systematic evaluation of a prototype multispectral data processing and analysis system. The system is the integration of (1) a preprocessing subsystem, (2) a spectral clustering a subsystem, (3) a correlation and classification subsystem, (4) mensuration subsystem, and (5) an information management subsystem. Aircraft, ERTS and EREP data are utilized to refine the subsystem elements for systems or system combinations that are optimally suited for a specific earth resources application. COMPUTER TECHNIQUES USED FOR SOME ENHANCEMENTS OF ERTS IMAGES,
Jet Propulsion Lab., Pasadena, Calif.
F. C. Billingsley, and A. F. H. Goetz.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1159-1167, 1973. 7 fig, 1 tab, 2 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Data processing, *Calibrations, Surveys, Mapping, Photogrammetry, Terrain analysis, Digital computers, Data collections.
Identifiers: *ERTS, Image enhancement.

The JPL VICAR Image Processing System was used for enhancement of images received from the ERTS for the Arizona geology mapping experiment. This system contains flexible capabilities for reading and repairing MSS digital tape images, for geometric corrections and interpicture registration, for various enhancements and analyses of the data, and for display of the images in black and white and color. (See also W74-06619) (Knapp-USGS)
W74-06653

DIGITAL ENHANCEMENT OF MULTISPECTRAL MSS DATA FOR MAXIMUM IMAGE VISIBILITY,
California Univ., Davis. Dept. of Electrical Engineering.
V. R. Algazi.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1169-1177, 1973. 8 fig, 11 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Data processing, *Calibrations, Surveys, Mapping, Photogrammetry, Terrain analysis, Digital computers, Data collections.
Identifiers: *ERTS, Image enhancement.

A systematic approach to the enhancement of ERTS images exploits two principal features involved in the observation of images: the properties of human vision and the statistics of the images being observed. The rationale of the enhancement procedure is: in the observation of some features of interest in an image, the range of objective luminance-chrominance values is generally limited and does not use the whole perceptual range of vision of the observer. The purpose of the enhancement technique is to expand and distort in a systematic way the grey scale values of each of the multispectral bands making up a color composite, to enhance the average visibility of the features being observed. W74-06654

ERTS-1 IMAGE ENHANCEMENT BY OPTICALLY COMBINING DENSITY SLICES,
California Univ., Riverside. Dept. of Geography.
G. O. Tapper, and R. W. Pease.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1179-1185, 1973. 4 fig, 5 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Data processing, *Calibrations, Surveys, Mapping, Photogrammetry, Terrain analysis, Data collections.
Identifiers: *ERTS, Image enhancement.

The technique of density slicing using a photographic film and its application to enhancement of ERTS-1 imagery is useful for mapping. Initial experiments conducted with this film were encouraging and indicated that this technique of density slicing using readily accessible darkroom facilities and simple darkroom procedures allows rapid, accurate, and facile interpretation of the imagery. The distribution of the Tree Yucca in the Eastern Mojave Desert of southern California and southern Nevada was used to test the accuracy of the technique for mapping purposes. The distribution was mapped at a relatively high level of accuracy. (See also W74-06619) (Knapp-USGS)
W74-06655

PSEUDOCOLOR TRANSFORMATION OF ERTS IMAGERY,
RAND Corp., Santa Monica, Calif.
J. Lamar, and P. M. Merifield.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1187-1198, 1973. 7 fig, 11 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Data processing, *Geologic mapping, Photogrammetry, Terrain analysis, *California, Faults(Geologic).
Identifiers: *ERTS, False color transformations.

Human vision was studied to increase the effectiveness of detection and recognition of ground features in ERTS imagery. In the course of this work, a number of image enhancement techniques were developed. One of the photographic techniques which shows great promise as an aid in interpreting ERTS imagery is pseudocolor transformation. It is a process where each shade of gray in an original black-and-white image is seen as a different color in the transformation. The ERTS-1 MSS image of the Monterey Bay-San Francisco area was transformed using a technique which requires only two intermediate separations. Possible faults were delineated on an overlay before comparing imagery to geologic maps. All large active or recently active faults shown on the latest geologic map of California were interpreted from the image for all, or much, of their length. Perhaps the most interesting result was the Reliz fault. The fault is mapped as covered; however, a lineation corresponding to the position of the fault is visible on the image. Although the faults are also visible in the unenhanced image, they are clearly accentuated and more easily mapped on the pseudocolor transformation. (See also W74-06619) (Knapp-USGS)
W74-06656

DIGITAL INTERACTIVE IMAGE ANALYSIS BY ARRAY PROCESSING,
Tetra Tech, Inc., Houston, Tex.
B. E. Sabels, and J. D. Jennings.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1199-1203, 1973. Append.

Descriptors: *Remote sensing, Satellites(Artificial), *Data processing, *Calibrations, Surveys, Mapping, Photogrammetry, Terrain analysis, Digital computers, Data collections.
Identifiers: *ERTS, Image enhancement.

A survey of ERTS-1 investigations discloses several categories of efforts which can be compared with seismic data processing categories. Optical and digital filtering and enhancement techniques attempt to eliminate noise or improve contrast in the resulting display. With improved processing algorithms, these lead to classification techniques, and to hybrid selection and suppression methods. Spectral and spatial detection efforts are aimed at low signal-to-noise contrasts, for the detection of subtle shades of grey or the respective color, which represent differences in soils, chlorophyll, stress, infestation, or other manifestations of resources conditions. Seismic and ERTS data can be interchanged in government and industrial processing facilities. The array processor is an instrument to free the investigator from data processing chores, so that he can use his time more efficiently for the interpretation and utilization of the data. The service, patterned after the commercial seismic data processing industry, will therefore increase the potential for the application and utilization of ERTS data. (See also W74-06619) (Knapp-USGS)
W74-06657

COMBINING HUMAN AND COMPUTER INTERPRETATION CAPABILITIES TO ANALYZE ERTS IMAGERY,
California Univ., Berkeley. Forestry Remote Sensing Lab.
J. D. Nichols.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1205-1210, 1973. 2 fig.

Descriptors: *Remote sensing, Satellites(Artificial), *Data processing, *Calibrations, Surveys, Mapping, Photogrammetry, Terrain analysis, Digital computers, Data collections.
Identifiers: *ERTS, Image enhancement.

The human photo interpreter and the computer have complementary capabilities that are exploited in a computer-based data analysis system designed to optimize the process of extracting resource information from ERTS images. The human has the ability to quickly delineate gross differences in land classes, and to further break these gross classes into meaningful subclasses. The computer can more efficiently analyze point-by-point spectral information and localized textural information, which can result in much more detailed agricultural or wildland classification based on species composition and plant association. These human and computer capabilities are integrated through the use of an inexpensive computer dedicated to the interactive preprocessing of the human inputs and the display of raw ERTS images and computer classified images. The small computer is linked to a large-scale computer system, where the statistical work and the automatic point-by-point classification is done. (See also W74-06619) (Knapp-USGS)
W74-06658

ANALYSIS OF ERTS IMAGERY USING SPECIAL ELECTRONIC VIEWING/MEASURING EQUIPMENT,
Stanford Research Inst., Menlo Park, Calif.
W. E. Evans, and S. M. Serebreny.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1211-1218, 1973. 5 fig, 1 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Data processing, *Calibrations, Surveys, Mapping, Photogrammetry, Terrain analysis, Digital computers, Data collections.
Identifiers: *ERTS, Image enhancement.

To process ERTS imagery, an Electronic Satellite Image Analysis Console (ESIAC) is being employed in studying dynamic hydrologic conditions. The ESIAC provides facilities for storing registered image sequences in a magnetic video disc memory for subsequent recall, enhancement, and animated display in monochrome or color. Quantitative measurements of distances, areas, and brightness profiles can be extracted digitally under operator supervision. Initial results are presented for the display and measurement of snowfield extent, glacier development, sediment plumes from estuary discharge, playa inventory, phreatophyte and other changes. (See also W74-06619) (Knapp-USGS)
W74-06659

COMBINED SPECTRAL AND SPATIAL PROCESSING OF ERTS IMAGERY DATA,
Kansas Univ., Lawrence. Space Technology Center.
R. M. Haralick, and K. S. Shanmugam.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentation, Sect B, Goddard

Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1219-1228, 1973. 3 fig, 1 tab, 7 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Data processing, *Calibrations, Surveys, Mapping, Photogrammetry, Terrain analysis, Digital computers, Data collections.
Identifiers: *ERTS, Image enhancement.

A procedure for extracting a set of textural features for ERTS MSS data is presented. The textural features were combined with a set of spectral features and were used to develop a classification algorithm for identifying the land use categories of blocks of digital MSS data. The classification algorithm was derived from a training set of 314 blocks and tested on a set of 310 blocks. The overall accuracy of the classifier was found to be 83.5% on seven land use categories. (See also W74-06619) (Knapp-USGS)
W74-06660

TERRAIN TYPE RECOGNITION USING ERTS-1 MSS IMAGES,
Itek Corp., Lexington, Mass. Optical Systems Div.
N. Gramenopoulos.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1229-1241, 1973. 4 fig, 1 tab.

Descriptors: *Remote sensing, Satellites(Artificial), *Data processing, *Calibrations, Surveys, Mapping, Photogrammetry, Terrain analysis, Digital computers, Data collections.
Identifiers: *ERTS, Image enhancement.

For the automatic recognition of earth resources from ERTS-1 digital tapes, both multispectral and spatial pattern recognition techniques are important. Recognition of terrain types is based on spatial signatures that become evident by processing small portions of an image through selected algorithms. Spatial signatures that are applicable to ERTS-1 MSS images were analyzed. Artifacts in the spatial signatures seem to be related to the multispectral scanner. A method for suppressing such artifacts is presented. The recognition of terrain types is accurate for desert (97%), farms (89%), and mountains (80%). The accuracy for urban areas is lower (74%), and poor for riverbeds (11%). Most of the errors in the urban category seem to occur in thinly populated areas associated with recent urban expansion into desert, farms, riverbeds, and hills. (See also W74-06619) (Knapp-USGS)
W74-06661

CLASSIFICATION OF ERTS-1 MSS DATA BY CANONICAL ANALYSIS,
Pennsylvania State Univ., University Park. Office for Remote Sensing of Earth Resources.
H. M. Lachowski, and F. Y. Borden.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1243-1251, 1973. 4 fig, 3 tab, 2 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Data processing, *Calibrations, Surveys, Mapping, Photogrammetry, Terrain analysis, Digital computers, Data collections, Statistical methods.
Identifiers: *ERTS, Image enhancement, Canonical analysis.

The objective of canonical analysis is to obtain the maximum separability among a number of categories. The application of canonical analysis was investigated using MSS ERTS-1 data for one area viewed on two dates. The effect of threshold values on classification regions and confusion regions was investigated. The test area was chosen because it was familiar and had a variety of natural and cultural targets. The specific targets that were selected for study were river water, the railroad yard, two suburban targets, and two vegetation targets. The canonical analysis of the test data showed that essentially all of the separability (99.9%) among the six categories could be recovered in four canonical axes. The four axes accounted for 88.5, 11.1, 0.2, and 0.06%, respectively, of the separability. (See also W74-06619) (Knapp-USGS)

F. P. Weber.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1513-1522, 1973. 8 fig, 4 tab.

Descriptors: *Remote sensing, Satellites(Artificial), *Calibrations, *Radiation, *Albedo, Data collections, Data processing, *South Dakota, Forests, Telemetry, Grasslands, Mining.
Identifiers: *ERTS.

Data collection platforms are being used at a Black Hills, South Dakota, test site to record radiometric measurements needed to determine solar and atmospheric parameters that affect ERTS-1 multispectral scanner radiance measurements. A total of 72 channels of analog data are transmitted from an unattended ground truth site at least six times a day. The system has operated with only minor problems, sending forth daily measurements of biophysical responses and atmospheric conditions. Comparisons of scene radiance data calculated from ERTS images with those measured on the ground show the image-measured values to be 35% higher for the green channel and 20% higher for the red channel for the same scene targets. Radiance values for channels 6 and 7 are nearly the same from the ground data as from the imagery. (See also W74-06619) (Knapp-USGS)

ERTS-1 APPLIED FOR STRUCTURAL AND MORPHOLOGICAL INVESTIGATIONS CASE STUDIES: (1) LOS ANGELES, CALIFORNIA AND (2) COASTAL PLAIN, NEW JERSEY,
William Paterson Coll. of New Jersey, Wayne. Dept. of Geography.
E. Y. Kedar.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1527-1538, 1973. 6 fig, 29 ref.

Descriptors: *Remote sensing, Satellites(Artificial), *Data collections, Radiation, Wavelengths, Mapping, Surveys, Monitoring, Geologic mapping, Coastal plains, New Jersey, California.
Identifiers: *ERTS, Los Angeles.

ERTS-1 image, which covers the area from South Los Angeles to the Mojave Desert and from Eastern San Gabriel Mts to Cuyama Valley and Central Santa Ynez Mts of the Transverse Ranges, California, was analyzed. This image was studied in conjunction with the following conventional sources: (1) the Los Angeles sheet of the geologic map of California; (2) the map of the geology of the Central Santa Ynez Mountains, Santa Barbara County, California; (3) the geologic map of Transverse Ranges, Southern California. ERTS-1 image, which covers the area from the Palisades, New York-New Jersey to Burlington, New Jersey, and from New Brunswick, New Jersey to the great Pecomic Bay, New York, was also analyzed. This image was compared with: (1) the geologic map of New Jersey 1:1,000,000; (2) the geologic map of New Jersey 1:250,000; and (3) selected maps as published in the geology of selected areas in New Jersey and Eastern Pennsylvania. Conventional sources, including field investigation, were found to be inadequate to supply all the required structural and paleohydrographic information needed. ERTS-1 was found to be an essential supplementary source of information for geologic explorations, much like and even better than space photography from manned spacecraft and SLR imagery. (See also W74-06619) (Knapp-USGS)
W74-06690

A PRELIMINARY EVALUATION OF ERTS-1 IMAGES ON THE VOLCANIC AREAS OF SOUTHERN ITALY (NASA CONTRACT FO-013),
Consiglio Nazionale delle Ricerche, Milan (Italy). Laboratorio per la Geofisica della Litosfera.
R. Cassinis, and G. M. Lechi.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect B, Goddard Space Flight Center, New Carrollton, Md, March 5-9, 1973: National Aeronautics and Space Admin Rept NASA SP-327, p 1539-1548, 1973. 5 fig.

Descriptors: *Remote sensing, Satellites(Artifical), *Geologic mapping, *Volcanoes, Data collections, Structural geology, Geothermal studies.
Identifiers: *ERTS, *Italy, *Sicily.

ERTS data were evaluated in a test site including all the regions of active and quiescent volcanism in southern Italy. The three active European volcanoes (Etna, Stromboli and Vesuvius) were included. Good results were obtained particularly on the southeast of Sicily over the Ragusan plateau, where several faults are clearly observed. In some cases a better pattern recognition is reached by the synoptic power of the ERTS enhanced images. (See also W74-06619) (Knapp-USGS)

Descriptors: *Remote sensing, Satellites(Artificial), *Geologic mapping, *Volcanoes, Data collections, Structural geology, *Geothermal studies.
Identifiers: *ERTS, *Iceland(Cascade Range).

A combination of infrared images and ground calibration points is particularly useful in plotting changes in surface temperatues and radiance and in delimiting areas of predominantly convective heat flow to the earth's surface in the Cascade Range and on Surtsey Volcano, Iceland. ERTS-1 Multispectral Scanner (MSS) and aircraft infrared imaging systems were used in conjunction with multiple thermistor arrays to study volcano surface temperatures. The data are relayed daily to Washington via Data Communication Platform (DCP) transmitters and ERTS-1. ERTS-1 MSS imagery reveals curvilinear structures at Lassen, the full extent of which have not been previously mapped. Interestingly, the major surface thermal manifestations at Lassen are aligned along these structures, particularly in the Warner Valley. On Lassen Peak, and possibly at Mt. St. Helens, smaller thermal anomalies are controlled by the contact margins of silicic or intermediate extrusive plugs. (See also W74-06619) (Knapp-USGS)

Descriptors: *Remote sensing, Satellites(Artificial), *Data processing, Photography, Data collections, Geomorphology.
Identifiers: *ERTS, *Photographic processing.

The contrast of ERTS 70 mm positive images can be enhanced to varying degrees by rephotographing the images with different types of negative films and by overdeveloping the films with different developers. A combination of high-contrast copy film and a high-energy developer yields high contrast. Still greater contrast may be obtained by using a film of higher contrast capability and a developer of higher energy capability. Contrast can also be enhanced in the printing process with the use of high-contrast photographic papers, or with the use of polycontrast photographic paper and filters. Contrast enhancement by photocopying delineates topographic boundaries and may aid in the objective measurement of topographic parameters. (See also W74-06619) (Knapp-USGS)

SAMPLE SIZES REQUIRED FOR TWO-SIDED COMPARISONS OF TWO TREATMENTS WITH A CONTROL,
National Research Inst. for Mathematical Sciences, Pretoria (South Africa).
F. E. Steffens, and R. de Villiers.
Technometrics, Vol 15, No 4, p 915-921, November 1973. 5 tab, 5 ref.

Descriptors: *Statistical methods, *Testing, Mathematical studies, Quality control, Probability, Control.
Identifiers: Comparison, Sample size, Bivariate t-test.

The two-sided bivariate t-test for simultaneous comparison of two treatments with a control is studies. The problem of allocating a given number of observations to the treatments and the control is discussed, and it is concluded that, in the absence

f preferences, a general purpose rule would be to hoose the sample sizes equal. A table is presented vhich gives the sample size required to ensure that he null hypothesis will be rejected with at least a prescribed probability, given the significance level nd the standardized differences between the reatments and the control. Similar tables are provided for use when the object is to ensure that oth treatment means will be found significantly ifferent from the control mean with at least a iven probability, or to ensure that a specified reatment will be found significant with at least a iven probability. nstruments and Control Systems, Vol 46, No 12, 41-43, December 1973. 2 fig, 5 tab, 2 ref.

escriptors: *Automatic control, *Algorithms, utomation.
dentifiers: *Process control, *Digital control, PID ontrollers, PI controllers, Digital feedback, Kalman algorithm.

ommon practice in the process industries is to se the discrete equivalent of the three-mode proportional-plus-integral-plus-derivative (PID) controller for digital feedback loops. A number of nique discrete algorithms have also been eveloped, but little industrial acceptance has een found except in cases such as basis weight nd moisture control on paper machines where ead time renders PID systems ineffective. This rticle is the third in a series comparing the performance of several discrete algorithms with three node control, for processes in which time constants rather than dead time dominate. Complete eneralization is not possible. However, comparisons will be based on a model of a jacketed ackmix reactor, which is representative of many eal processes. (Mortland-Battelle)

FLOOD OF OCTOBER 1972 AT PETERSBURG AND COLONIAL HEIGHTS, VIRGINIA,
Geological Survey, Washington, D. C.
E. M. Miller, and P. N. Walker.
For sale by USGS, Washington, D. C. 20242, Price $0.75. Hydrologic Investigations Atlas HA-505, 1973. 1 sheet, 2 fig, 1 photo, 3 ref. NSF Grant GA 28190XI.

Descriptors: *Historic floods, Floods, *Virginia, *Flood data, *Flood discharge, Peak discharge, Flood frequency, Flood recurrence interval, Flood profiles, *Maps.
Identifiers: Petersburg(Va), *Appomattox River(Va).

The areas inundated by the Appomattox River at Petersburg, Va., and by Swift Creek at Colonial Heights, Va., during the flood of October 1972 are shown on a topographic base map. The flood, the highest known on the Appomattox River, was caused by heavy rains which accompanied a low-pressure system that stagnated off the Virginia-North Carolina Coast. The flood of October 1972 reached an elevation of 86.69 feet above mean sea level (msl) at the gaging station on the Appomattox River at Matoaca, Va., (drainage area, 1,344 sq mi) and was the highest since records began in October 1969. The peak discharge on October 7, 1972, was 40,800 cfs at Matoaca as compared with a peak discharge of 28,000 cfs on August 20, 1940, the second highest flood of record. The stage-frequency relation derived from the record of annual floods for period 1927-66 at the U.S. Geological Survey gaging station near Petersburg and for period 1970-72 at the Virginia Bureau of Water Resources gaging station at Matoaca is shown. The 1972 flood had a recurrence interval of about 80 years, whereas the 1940 flood had a recurrence interval of about 30 years. Profiles of the water surface of the Appomattox River during the floods of October 1972 and August 1940 are shown. (Knapp-USGS)

HYDROLOGY AND WATER RESOURCES OF THE HOOSIC RIVER BASIN, MASSACHUSETTS,
Geological Survey, Washington, D.C.
B. P. Hansen, L. G. Toler, and F. B. Gay.
For sale by USGS, Washington, D.C. 20244 Price $1.00 per set. Hydrologic Investigations Atlas HA-481, 2 sheets, 1973. 23 fig, 1 map, 28 ref.

Descriptors: *Water resources, *Massachusetts, *Surface waters, *Groundwater, Floods, Water quality, *Maps, Flood profiles, Hydrogeology, Water yield, Hydrologic data, Runoff, Streamflow.
Identifiers: *Hoosic River basin(Mass).

Information is provided on the quantity, quality, and availability of water in that part of the Hoosic River basin located in Massachusetts. Deep bedrock valleys along the main stem have been filled with more than 300 feet, in places, of glacial lake sediments and outwash deposits, which form the main groundwater reservoirs in the basin. Higher elevations expose the bedrock or are covered with varying thicknesses of glacial till. Drainage is in well-defined channels. The regimen along the main stem has been altered by Cheshire Reservoir and construction of flood control structures in Adams and North Adams. The main valley of the Hoosic River is underlain by stratified unconsolidated material, which is over 300 feet thick locally. Most of this material is fine-grained and will yield very little water to wells. Dposits of sand and gravel within the fine-grained material yield large volumes of water. Some unconsolidated deposits may be hydraulically connected to the carbonate bedrock aquifer that underlies most of the valley, which may result in artesian conditions. The magnitude of a flood at selected frequencies can be estimated from regional flood frequency formulas. The concentration of suspended sediment varies with discharge and is highest during periods of spring runoff. Lower water temperature and less biochemical activity results in higher concentrations of dissolved oxygen and less diurnal variation in December. Regional draft-storage frequency analyses are given. (Knapp-USGS)
W74-06958

AVAILABILITY OF GROUND WATER IN THE GRANTS PASS AREA, JOSEPHINE COUNTY, OREGON,
Geological Survey, Washington, D. C.
J. H. Robison.
For Sale by USGS, Washington, D. C. 20242, Price $1.00 per set. Hydrologic Investigations Atlas HA-480, 1973. 2 sheets, 7 fig, 1 map, 1 tab, 11 ref.

Descriptors: *Groundwater, *Hydrogeology, *Oregon, *Maps, Hydrologic data, Water yield, Water quality.
Identifiers: *Grants Pass(Oreg), *Josephine County(Oreg).

Groundwater information is presented in a form that will enable water users near Grants Pass, Oregon to estimate the likelihood of obtaining groundwater in adequate quantity and suitable quality. The Grants Pass area is located in southwestern Oregon and has an area of about 270 square miles entirely within the Rogue River drainage basin and Josephine County. Alluvium is the major aquifer near the city of Grants Pass and along the Rogue River. Few yields are less than 5 gpm with 50 ft of drawdown; yields of 40 gpm with less than 40 ft of drawdown are not uncommon. Yields to wells drilled into conglomerate appear to

average somewhat less than yields from granitic rocks in the area. Granitic intrusive rocks of the Grants Pass batholith serve as aquifers in areas underlain by these rocks; a substantial part of the recent residential development has been in granitic areas. Well yields depend largely on the depth and degree of weathering and the extent of fracturing of the rocks--characteristics that have wide local variation. Well yields range from less than 1 gpm with several hundred feet of drawdown in some wells completed in 'tombstone granite' to at least 60 gpm with 50 ft of drawdown in a few wells where weathered or fractured zones are exceptionally well developed. Iron is excessive in some groundwater from the upper, weathered zone in granitic rocks or from alluvium that was derived mostly from granitic rocks. (Knapp-USGS)
W74-06959

QUALITY OF GROUND WATER IN THE LOWER COLORADO RIVER REGION, ARIZONA, NEVADA, NEW MEXICO, AND UTAH,
Geological Survey, Washington, D. C.
L. R. Kister.
For Sale by USGS, Washington, D. C. 20242, Price $1.00 per set. Hydrologic Investigations Atlas HA-478, 2 sheets, 1973. 3 fig, 2 map, 17 ref.

Descriptors: *Water quality, *Colorado River basin, Water chemistry, Salinity, *Maps, Hydrologic data, Hydrogeology.

Data are presented on the areal and vertical distribution of the dissolved-solids and fluoride concentrations in groundwater for the lower Colorado River region, an area of about 140,000 square miles in parts of Arizona, Nevada, New Mexico, and Utah. The basin and range province is characterized by isolated north to northwest-trending mountain ranges separated by broad alluvial-floored basins. The water in the mountains generally contains less than 1,000 milligrams per liter dissolved solids, except where water issues from saline springs. The dissolved-solids concentrations in the groundwater in the alluvium range from less than 100 to more than 100,000 mg/liter and generally are less than 1,000 mg/liter. The plateau uplands province includes a variety of landforms--canyons, buttes, mesas, and mountains. Although igneous and metamorphic rocks are the main rock types in the uplands, the sedimentary rocks form the most important aquifers. The dissolved-solids concentrations in groundwater vary areally and with depth and range from 90 to more than 60,000 mg/liter in about 1,500 samples analyzed. The principal constituents in the groundwater in the uplands are bicarbonate, sulfate, calcium, sodium, and chloride. The central highlands province forms a topographic high that separates the Plateau uplands from the Basin and Range lowlands in most of the lower Colorado River region. Volcanic rocks crop out in much of the area, are permeable, and water moves readily through them and recharges the underlying groundwater reservoir. Thin alluvial deposits in a few small valleys also store groundwater. Springs along the Mogollon Rim and elsewhere in the Central highlands are the source of the perennial flow in the Gila, Salt, and Verde Rivers. The groundwater generally contains less than 1,000 mg/liter of dissolved solids. However, several springs yield saline water to streams. (Knapp-USGS)
W74-06960

WATER RESOURCES OF NORTHWESTERN MISSOURI,
Geological Survey, Washington, D.C.
E. E. Gann, E. J. Harvey, and J. H. Barks.
For Sale by USGS, Washington, D.C. 20242, Price $1.50 per set. Hydrologic Investigations Atlas HA-444, 4 sheets, 1973. 26 fig, 7 tab, 48 ref.

Descriptors: *Water resources, *Missouri, Surface waters, Groundwater, Streamflow, Water yield, Water quality, Hydrogeology, Hydrologic data, *Maps.

A general summary is presented of information concerning the occurrence, availability, use, and quality of water in northwestern Missouri. Also included is a definition of problems and potentials which should be considered in the development of the water resources of the area. This atlas covers an area of approximately 13,000 square miles. The principal sources of fresh groundwater are the alluvium of the Missouri River valley, the alluvium of tributary valleys, and the outwash deposits in buried bedrock valleys. The existing drainage network has been developed on the unconsolidated materials overlying the buried bedrock valleys. Hydraulic connection between the alluvium of tributary valleys and the buried valleys is poor in most areas owing to relatively impermeable silt and clay deposits separating the two aquifers. However, toward the lower end of the Grand River valley the two aquifers may be connected. Artesian conditions exist in most of the buried valleys and in some areas in the Missouri River valley and tributary valleys. Water from bedrock aquifers in northwestern Missouri is generally too highly mineralized for most uses. The flow of streams in northwestern Missouri is highly variable. The average flow for a particular month may vary from year to year by a factor of 1,000. Minimum monthly mean flows of most streams in the area occurred during the severe droughts of the 1930's and mid-1950's. Maximum monthly mean flows generally occurred during the late-1920's, mid-1940's, and early-1960's. Flow-duration curves present general streamflow characteristics of streams in northwestern Missouri. Generalized estimates of average annual sediment yield are useful in the preliminary design of water resources projects. (Knapp-USGS)
W74-06961

STREAM TEMPERATURES IN WASHINGTON STATE,
Geological Survey, Washington, D.C.
M. R. Collings, and G. T. Higgins.
For sale by USGS, Washington, D.C. 20242, Price $1.00 per set. Hydrologic Investigations Atlas HA-385, 2 sheets, 1973. 11 fig, 1 tab, 7 ref.

Descriptors: *Water temperature, *Streams, *Washington, *Maps, Hydrologic data, Springs, Streamflow, Water quality, Urbanization.

Stream temperatures in Washington State are shown in this 2-sheet hydrologic atlas. The purpose of this study was to gain an understanding of the magnitudes, geographic distribution, and time variations in temperatures of streams in Washington, as defined by major drainage areas. The information provides a basis for evaluating the streams relative to their use for fish propagation, and for municipal, industrial, and agricultural supply. Data used included those from thermographs, once-daily observations, and intermittent temperature measurements. Of the data from intermittent temperature measuring sites, only those sites with at least 8 well-spaced measurements throughout the year (most sites had a greater number) were used. For the analysis all data for the period from January 1, 1960, through December 31, 1967, were used. Several streams have anomalous temperature patterns. Many of these temperature patterns are due to natural influx of hot or cold water from springs--flow from a warm spring affects temperatures at station 1123 in the Lower Columbia River drainage and a cold spring affects temperatures at station 1073 in the Puget Sound drainage. The influence of large groundwater inflow and the effect of urbanization are shown. (Knapp-USGS)

COMPARISON OF STRENGTH TEST METHODS FOR CORRUGATED PLASTIC DRAINAGE TUBING,
Ohio State Univ., Columbus. Dept. of Agricultural Engineering
F. T. Scribe, J. L. Fouss, and G. O. Schwab
Transactions of the ASAE (American Society of Agricultural Engineers) Vol 15, No 3, p 445-447, May-June, 1972. 8 fig, 8 ref

Descriptors: *Plastic deformation, *Plastic pipes, Closed conduits, Tile drains, Tiles, Subsurface drains, Pipes, *Strength

The sand box and parallel plate methods for measuring the load deflection of corrugated plastic drainage tile were evaluated. Twelve-inch lengths of unslotted plastic tubing at a temperature of 72F and 50% relative humidity were tested using both methods. Deflection of the tubing was not allowed to exceed 5%. The load is linearly related to the deformation for deflections less than 5% in both test methods. Both methods give similarly accurate results. The parallel plate method is preferred because it is much faster to perform. (Skogerboe-Colorado State)

WOODCOCK CREEK LAKE, FRENCH CREEK BASIN, PENNSYLVANIA (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District, Pittsburgh, Pa.
Available from the National Technical Information Service as EIS-PA-73-0623-F $5.00 in paper copy, $1.45 in microfiche. January 1973. 49 p, 2 map.

Descriptors: *Environmental effects, *Reservoir construction, *Flood protection, *Dams, Flood control, Streamflow, Natural flow, Reservoir silting, Wildlife, *Pennsylvania, Turbidity, Impoundments, Surface waters.
Identifiers: *Environmental Impact Statement, Saeger Town and Meadville(Pa), *French Creek(Pa).

This project involves the further development of the coordinated French Creek Basin reservoir system by construction of a retention type dam on Woodcock Creek in Pennsylvania. The environmental impacts of the project include providing a higher degree of flood protection thereby creating an environment more favorable to economic stability; loss of part of the natural stream section, inundating several acres; providing a degree of stream flow management; and encouraging development of recreation in the project area. The major adverse environmental effects will be increased stream turbidity and siltation during construction. In addition, increased flood protection could encourage more extensive agricultural usage and development, thereby reducing the amount of land available for propagation of wildlife. (Daniels-Florida)

HYDRAULIC ROUGHNESS OF CORRUGATED PLASTIC TUBING,
Guelph Univ. (Ontario). School of Engineering.
R. W. Irwin, and G. Tsang.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 15, No 2, p 290-291, 295, March-April, 1972. 3 fig, 1 tab, 10 ref.

Descriptors: *Plastic pipes, *Tile drains, *Subsurface drains, Hydraulic conduits, Closed conduits, Fluid friction, Hydraulic design, *Reynolds number, *Roughness(Hydraulic), Turbulence, Drainage.
Identifiers: *Corrugated plastic tubing.

The functional relationships between frictional factor, Reynolds number, and relative roughness are determined for corrugated plastic drainage tubing. All tubing used was unperforated 4-inch diameter. The test section was 50 feet in length minus 10 feet at the inlet and 5 feet at the outlet allowed for end effects. The tubing was maintained full at all flow rates. Friction factors for corrugated tubing are about twice as great for well laid tile. A single value to indicate pipe roughness for hydraulic design cannot be used for corrugated plastic tubing. A value specific to the tubing must be chosen. Plots of data obtained are included. (Skogerboe-Colorado State)
W74-06589

EFFECT OF ROUGHNESS ELEMENTS ON HYDRAULIC RESISTANCE FOR OVERLAND FLOW,
Soil Testing Services, Inc., Northbrook, Ill.
T. S. Kowobari, C. E. Rice, and J. E. Garton.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 15, No 5, p 979-984, September-October, 1972. 4 fig, 4 tab, 8 ref.

Descriptors: Hydraulics, *Open channel flow, *Manning's equation, Fluid mechanics, Open channels, *Hydraulic models, Head loss, *Roughness(Hydraulic).

Gradually-varied flow experiments were conducted in a 1.32 foot by 24 foot long test section of a 44 foot long WF steel beam channel. The bottom was lined with aluminum sheet material which was fitted with round aluminum pegs of sizes 3/32 in. and 9/32 in. diameters. The pegs, which served as roughness elements, were placed in the channel bed at definite longitudinal and transverse patterns and spacings. Under the bare channel lining condition, a maximum flow of 0.885 cfs was introduced into the channel. Test slopes for the adjustable slope channel were restricted to approximate values of 0.0025, 0.0050 and 0.010. The objective was to determine the relationship of Manning's resistance coefficient to size of roughness elements, pattern of arrangement, density of spacing, slope, and discharge in a smooth artificial channel using dimensional analysis and gradually-varied flow. High correlations between calculated and observed values of the resistance coefficient were obtained for all of the model equations. (Skogerboe-Colorado State)

DEVELOPING REGION IN SELF-AERATED FLOWS,
Karlsruhe Univ. (West Germany). Institut fuer Hydromechanik, Staunanlagen und Wasserversorgung.
K. K. Lai, and I. R. Wood.
Journal of the Hydraulics Division, American Society of Civil Engineers Vol 100, No HY4, Paper 10501, p 553-568, April 1974. 16 fig, 12 ref, append.

Descriptors: *Aeration, *Spillways, Reaeration, Open channel flow, Turbulent flow, Hydraulic models, Mixing.
Identifiers: Self-aerated flows.

A stuey of the effect of aeration on the spillway flow of a large dam was combined with a study of the region of developing self-aerated flow in a model flume. Using the model data as a basis, an analysis of the developing region treats the aerated layer independently of the underlying water layer and the physical conditions upstream of the critical point where aeration commences. On the basis of a comparison with the prototype data, a design method is presented for a portion of the developing, partially aerated region of spillway flows. (Knapp-USGS)
W74-06739

ON SQUIRE'S THEOREM IN THE STUDY OF HYDRODYNAMIC STABILITY OF PLANE-PARALLEL FLOWS OF INCOMPRESSIBLE FLUIDS ABOUT DEFORMING BOUNDARIES,
V. V. Skripachev.
Fluid Mechanics--Soviet Research, Vol 2, No 6, p 171-174, November-December 1973. 3 ref. (Originally published in Gidromekhanika, No 21, p 75-79, 1972.).

Descriptors: *Fluid mechanics, *Hydrodynamics, *Flow, *Stability, Boundary processes, *Boundaries(Surfaces), Boundary layers, Equations.
Identifiers: USSR, *Squire's theorem.

To determine the point of stability loss of a flow of a viscous incompressible fluid about deforming boundaries, three-dimensional disturbances must be calculated. The Squire theorem was found to be inapplicable for flow about deforming boundaries. (Josefson-USGS)
W74-06911

STRUCTURE OF THE VELOCITY PROFILE OF A SUSPENSION-BEARING FLOW,
Yu. K. Vitoshkin.
Fluid Mechanics--Soviet Research, Vol 2, No 6, p 27-32, November-December 1973. 2 fig, 11 ref. (Originally published in Gidromekhanika, No 18, p 72-76, 1971.).

Descriptors: *Fluid mechanics, *Flow, *Velocity, *Suspension, Mixing, Density, Equations.
Identifiers: USSR.

A formula is derived for constructing the velocity profile in a suspension-bearing flow by integrating the initial equation of the theory of turbulent mixing and by considering the nonuniform distribution of density of the mixture over the depth of flow. The method proposed for constructing the velocity profile of a suspension-bearing fluid yields satisfactory agreement with test data for various solid materials up to 2 mm in size. The method is substantiated by a comparison of the calculations with about 100 test plots. A comparison of some computed velocity profiles with test data is graphed. (Josefson-USGS)
W74-06912

DEGREE OF LOCAL SATURATION OF A FLOW BY SUSPENDED MATTER AND ITS RELATION TO THE VOLUME CONCENTRATION,
S. I. Kril', and E. L. Belilovskiy.
Fluid Mechanics--Soviet Research, Vol 2, No 6, p 6-11, November-December 1973. 3 fig, 10 ref. (Originally published in Gidromekhanika, No 18, p 54-59, 1971).

Descriptors: *Fluid mechanics, *Flow, *Suspended solids, *Saturation, Statistical models, Probability, Equations.
Identifiers: USSR.

The usefulness of setting up a statistical model of suspension-bearing flows on the basis of a discrete interpretation of concentration is demonstrated. An effective approximate method is considered for finding the distribution of the probabilistic content of suspended matter with height for the simple case of a plane-parallel, quasi-steady, and uniform suspension-bearing flow. A differential equation is obtained for determining the probabilistic concentration provided the volume concentration is known. A specific solution of the equation is found for two specific flow modes. (Josefson-USGS)
W74-06913

THE INFLUENCE OF CLAY FRACTION ON THE BASIC PARAMETERS OF THE HYDROTRANSPORT OF FINE FREE-FLOWING MATERIALS,
N. A. Silin, V. M. Karasik, and V. N. Kondakov.
Fluid Mechanics--Soviet Research, Vol 2, No 6, p 1-5, November-December 1973. 4 fig, 5 ref. (Originally published in Gidromekhanika, No 18, p 51-54, 1971.).

Descriptors: *Fluid mechanics, *Flow, *Sediment transport, *Suspension, *Clays, Sands, Particle size, Velocity, Friction, Density, Hydraulic gradient, Curves.
Identifiers: USSR.

The transport of fine sand was investigated in tailings from the Verkhnedneprovsk Metallurgical Combine (GOK). The tailings consisted of fine quartz sand (average diameter=0.25 mm) containing up to 7% of a clay fraction with an average diameter less than 0.0062 mm. The investigation was divided into two test series. In the first series, the hydraulic gradients and the velocities of the suspension-bearing flow at various average consistencies (densities) were measured during the motion of mixtures containing washed solid material (minus the finest fractions). In the second series, similar measurements were made with hydromixtures containing fixed amounts of an added fine fraction. Tests were initially run with the addition of clay particles to the suspension-bearing flow or additives from the GOK tailings. Later the same tests were run with additives of spondyloid clay (average diameter=0.06 mm). In all cases, the amount of clay particles in the flow at any hydromixture concentration was about 7% of the total amount of solid material. The coefficient of internal friction for washed sand was larger by a factor of 1.6 than that for sand containing 7% of clay particles. (Josefson-USGS)
W74-06914

DISTRIBUTION OF AVERAGE LONGITUDINAL VELOCITIES IN FLOWS WITH COARSE-GRAINED MATERIALS,
Yu. N. Krivenko.
Fluid Mechanics--Soviet Research, Vol 2, No 6, p 20-26, November-December 1973. 6 fig. (Originally published in Gidromekhanika, No 18, p 66-72, 1971.).

Descriptors: *Fluid mechanics, *Flow, *Velocity, *Coarse sediments, Particle size, Sediment transport, Pressure, Pipes, Cross-sections, Instrumentation, Measurement, Equations.
Identifiers: USSR.

Flows containing rolled material of fixed coarseness were investigated for distribution of average longitudinal velocities over the total area of a pressure flow containing particulate material. Materials measuring 0.5-1, 1-2, 1-3, 2-3, 3-5, 3-10, 5-10, and 7-25 mm were transported in a pipe 106 mm in diameter, and materials measuring 10-20 mm and 20-40 mm were transported in a pipe 206 mm in diameter. The ratio of soil volume in a compact body to volume of the hydromixture varied between 0.03 and 0.24. The instrument used to measure average longitudinal velocities and consistencies of hydromixtures over the total cross-sectional area of flow is diagrammed, and graphs show distribution of average longitudinal velocities over the vertical diameter of the flow cross-section and change in dynamic flow radius as a function of coarseness of flow of the material transported. (Josefson-USGS)
W74-06915

ENERGY LOSSES IN A TWO-PHASE FLOW CONTAINING COARSE-GRAIN MATERIAL,
Yu. N. Krivenko.
Fluid Mechanics--Soviet Research, Vol 2, No 6, p 12-19, November-December 1973. 4 fig, 3 ref. (Originally published in Gidromekhanika, No 18, p 59-66, 1971.).

Descriptors: *Fluid mechanics, *Flow, *Energy loss, *Sediment transport, *Coarse sediments, Particle size, Suspension, Resistance, Friction, Velocity, Pipes, Pipe flow, Equations.
Identifiers: USSR.

Energy losses in overcoming friction between solid particles and solid pipe-wall material are determined. The difference between total energy losses and work against these frictional forces is shown to be close to the energy losses in the flow of a pure fluid. A physical basis is presented for the method of calculating hydraulic resistances. (Josefson-USGS)

THE CHALLENGE OF MILITARY NUCLEAR CONSTRUCTION,
Army War Coll., Pa. Carlisle Barracks, Pa.
B. C. Hughes.
Aval: NTIS, Springfield, Va., as AD-764 601. $5.45 per copy, $1.45 microfiche. March 8, 1972. 75 p, 16 fig, 3 tab, 1 bib. of 14 ref.

Descriptors: *Nuclear explosions, Civil defense, *Construction, Craters, Excavations, Nuclear engineering, Seismic waves, *Radioactivity, Fallout, Reserach and development, Economics, Technology, Testing, Safety, *Safety factors, Canal construction, Dam construction, Road construction, Harbors, Beneficial use, Cost-benefit theory, *Military aspects.

Rationale is provided to support the initiation of a comprehensive program for the development of the capability to use nuclear construction techniques in support of military operations. This military capability which has the potential for providing significant savings in manpower, time, and funds could be developed as a follow-on of the research and development accomplished to date for civil applications. The nuclear construction research programs of both the US and USSR are described in detail with emphasis on the nuclear and chemical cratering experiments that have been conducted and the technology which has been developed. A discussion of the hazardous safety effects resulting from a nuclear cratering detonation is included together with a description of the techniques which have been developed to control these effects and preclude personnel injuries. Potential military construction applications include nuclear quarries, harbors, roadway cuts, and inland canals. It is recommended that the Department of the Army develop and incorporate in its doctrine the use of nuclear construction techniques in support of military operations. The foregoing embodies a broad concept of peaceful uses of atomic energy, many of which have been developed through the plowshare program by the USAEC. (Houser-ORNL)

QUASI-CONTINUOUS EXPLOSIVE CONCEPTS FOR HARD ROCK EXCAVATIONS,
Shock Hydrodynamics. Sherman Oaks, Calif.
N. A. Louie.
Available from the National Technical Information Service as AD-765 792 $3.50 in paper copy, $1.45 in microfiche. Final Report, June 1973. 57 p, 18 fig, 9 tab, 6 ref, append. ARPA Contract H0220026.

Descriptors: *Excavation, *Rock excavation, *Explosions, Explosives, Project feasibility, Craters, *Rock mechanics, Granites, Concretes, Engineering, Geology, Apparatus, Machinery, Engineering structures, Hydrodynamics.
Identifiers: *Projectiles, Pulsed explosions.

The use of continuous or quasi-continuous systems for pulsed explosion rock excavation, can have major advantages over conventional methods. The feasibility and applicability of such an explosive system concept are discussed. The optimum properties of the explosive system, the effectiveness of the explosive-rock interactions, and the interactions between successive explosions were determined in tests on granite and concrete. A prototype multiple charge launcher was designed, built and tested to demonstrate the feasibility of a multiple feed system. The quasi-continuous explosive projectile launcher appears to be capable of unusually high drilling rates into hard rock. Recommendations are made for application of the launcher system to actual hard rock excavation conditions. An appendix gives details of apparatus and machinery. (Houser-ORNL)

RELATIVE RECOVERIES OF HATCHERY-REARED LANDLOCKED SALMON PLANTED AT DIFFERENT AGES AT SCHOODIC LAKE, MAINE,
Maine Dept. of Inland Fisheries and Game, Machias.
K. A. Havey.
Trans Am Fish Soc. Vol 102, No 1, p 121-124. 1973.
Identifiers: Ages(Fish), Lakes, *Maine(Schoodic Lake), Salmo-salar, *Salmon, *Fish hatcheries.

Relative recoveries of landlocked salmon Salmo salar planted at ages 0+ (fall), I (spring) and I+ (fall) were compared by analysis of variance and a multiple range test. Data were collected from angler catches (1963-1969) and from trap net catches (1963-70). Sample sizes were 987 salmon from angling and 1018 salmon from netting. The analysis of variance revealed a significant difference in recoveries of salmon of different ages at planting, and the Student-Newman-Keuls multiple range test showed that the significant difference was between age 0+ and age I+ salmon. At Schoodic Lake, Maine, comparable sport fisheries could be provided by stocking either 1000 age I+ salmon or 2800 age 0+ salmon. The smaller salmon would cost only 70% as much as the larger.--Copyright 1973, Biological Abstracts, Inc.

AN EVALUATION OF STRIPED BASS FINGERLING CULTURE,
Wayne Community Coll., Goldsboro, N.C.
E. T. Humphries, and K. B. Cumming.
Trans Am Fish Soc. Vol 102, No 1, p 13-20, 1973. Illus.
Identifiers: *Bass(Striped), Cladocerans, Copepods, *Cultures, Diet, Fingerlings, Insects, Morone-Saxatilis, Predation, *Fish hatcheries.

A synopsis of investigations concerned with culture of striped bass (Morone saxatilis, Walbaum) fingerlings is presented. An historical review of significant events includes the development of hatcheries and rearing techniques. Changes in food habits and feeding occur with early development of the fish. Early instars of copepods and cladocerans are preferred natural foods until the fish are about 10 mm in total length. The diet of fish in the 10-30 mm size group consists mainly of adult copepods supplemented with some caldocerans and insect larvae. Fish in the 30-80 mm size group utilize fewer copepods while cladocerans and insect larvae make up the major

portion of the diet. Insect larvae are the most important foods of fish in the 80-100 mm size group. A comparison of first yr growth rates of pond-reared striped bass with those sampled from natural waters on the mid-Atlantic Coast indicates that both groups of the fish grow at approximately the same rate for the first 30 days, after which the pond-reared fish grow much faster. Striped bass reared in ponds are approximately 170 mm in length at the end of the first yr while those in natural waters are about 110 mm long. Factors affecting growth and survival of young striped bass include predation, handling, stress, and various water quality factors. The future outlook for fingerlings culture includes the development of hatcheries, nursery ponds, and intensive culture techniques.--Copyright 1973, Biological Abstracts, Inc.

NINTH ANNUAL REPORT OF THE OKLAHOMA WATER RESOURCES RESEARCH INSTITUTE, FISCAL YEAR 1974.
Oklahoma Water Resources Research Inst., Stillwater.
Available from the National Technical Information Service as PB-231 271; $8.00 in paper copy, $1.45 in microfiche. Institute Annual Report, Part 1, 1973. 91 p.

Descriptors: *Water resources institute, *Oklahoma, Water resources research act, Universities, Contracts, Grants, Eutrophication, Thermal stratification, Groundwater.

This is the 9th annual report of the Oklahoma Water Resources Research Institute. The most pressing water problems of the State continue to be in water resources planning. Oklahoma is mining water from the Ogallala Aquifer at a rate far in excess of natural recharge. The irrigated farming of Oklahoma's high plains is dependent upon a diminishing supply of groundwater. This and other groundwater problems (surface subsidence and groundwater pollution) are currently being discussed at a series of regional conferences sponsored by the OWRR and the regional Institute directors. For the past several years, the Institute and affiliated university researchers have been studying the effect of eutrophication and summer stratification on the water quality and ecosystems of lakes and reservoirs. A reliable method of lake destratification can be developed economically and be used effectively on the largest of lakes. While large reservoirs can be prevented from undergoing the usual summer stratification, the ecological advisability of doing so must be determined. The rewards of destratification (or the prevention of stratification) include enhanced water quality and the slowing or even the reversal of the eutrophic process. (Knapp-USGS)

ANNUAL REPORT, FY 1973.
North Carolina Water Resources Research Inst., Raleigh.
Available from the National Technical Information Service as PB-231 308, $4.00 in paper copy, $1.45 in microfiche. Report WRRI-UNC-73-00, (1973), 74 p. OWRR A-999-NC(38). 14-31-0001-3833.

Descriptors: *Water Resources Research Act, *Education, *Water Resources Institute, *Universities, Colleges, Training, *North Carolina, Projects, *Research and Development, Grants, Contracts.

The Water Resources Research Institute is The University of North Carolina's water research center. Located at N.C. State University at Raleigh, the Institute serves all sixteen campuses of The University of North Carolina System. It works closely with the Department of Natural and Economic Resources and other agencies in the formulation of a research program responsive to State water resource problems. A 27-man Advisory Committee representative of State and federal water agencies, industry, conservation, agriculture, local government, and the general public provides program guidance and review. The Institute's research program for FY 1972-73 was supported by an annual allotment and 10 matching grants from OWRR, USDI; a grant from the EPA; matching State appropriations; matching funds from Texas Gulf Sulphur Corp.; a grant from Z. Smith Reynolds Fdn.; and a grant from the Office of Water and Air Resources, NCDNER. All senior colleges and universities in North Carolina are eligible to participate in the Institute's program. During FY 1972-73, projects were conducted at N.C. State University, University of North Carolina at Chapel Hill, University of North Carolina at Charlotte, Duke University, and East Carolina University. (Howells-North Carolina State)

Correlation Between CO2 and O2 Concentrations in Lake Erie, USA,
W74-07025 5C

ANALOG COMPUTERS

Cancellation of Spectrophotometer System Characteristics Using an Analog Computer,
W74-06874 2K

ANALYSIS

Component Description and Analysis of Environmental Systems: Oxygen Utilization in Aquatic Microcosms,
W74-06575 5C

Investigation of Mercury Contamination in the Tennessee Valley Region,
W74-06780 5B

ANALYTICAL TECHNIQUES

Synopsis of Workshop on Modeling of the Eutrophication Process,
W74-06561 5C

Environmental Mercury Contamination.
W74-06770 5B

Methods of Analysis for Mercury and its Compounds: A Review,
W74-06785 5A

Mercury Content of Canadian Foods and Cereals Determined by Different Methods,
W74-06787 5A

Determination of Mercury in Biological Tissues,
W74-06790 5A

The Determination of Ethylmercury in Blood,
W74-06791 5A

The Determination of Mono- and Dimethylmercury Compounds by Gas Chromatography,
W74-06792 5A

Evaluation of a Microwave-Induced Plasma Spectrometer for Trace Analysis,
W74-06841 5A

ANIMAL PATHOLOGY

Biological Reactions and Pathological Changes in Human Beings and Animals Caused by Organic Mercury Contamination,
W74-06804 5C

ANIMAL WASTES (PIGS)

Balantidiasis Outbreak in Truk,
W74-07031 5C

ANTARCTIC
Chemical Profile of the Ross Ice Shelf at Little America V, Antarctica,
W74-06921 2C

Folding of Cold Ice,
W74-06928 2C

Analysis of Iodine in Antarctic Snow,
W74-06929 5B

Silver Concentrations in Antarctic Snow and Firn,
W74-06930 5A

Analysis of the Concentration of Microparticles in the Long Ice Core from Byrd Station,
W74-06931 2C

PB-210 Concentration in Ice Measured at South Pole Station,
W74-06932 5A

APPOMATTOX RIVER (VA)
Flood of October 1972 at Petersburg and Colonial Heights, Virginia,
W74-06957 7C

AQUATIC ALGAE
The Genus Neochloris Starr (Chlorophyceae, Chlorococcales),
W74-06760 5A

AQUATIC ENVIRONMENT
Freshwater Biology and Pollution Ecology: Training Manual.
W74-06558 5A

AQUATIC HABITATS
Choctawhatchee River and Holmes Creek, Florida, Permit Application by Florida Game and Fresh Water Fish Commission (Final Environmental Impact Statement).
W74-06985 4A

AQUATIC INSECTS
Observations on Comparative Propensities for Carp Fry Destruction by Adults and Last Instar Preimaginal Stages of Predatory Aquatic Insects,
W74-07044 2I

AQUATIC LIFE
Freshwater Biology and Pollution Ecology: Training Manual.
W74-06558 5A

AQUATIC PLANTS
The Effects of Ecological Changes on Buckeye Lake, Ohio, with Emphasis on Largemouth Bass and Aquatic Vascular Plants,
W74-06546 5C

Aquatic Vegetation of the Ottowa River Near Chalk River Nuclear Laboratories (CRNL),
W74-06819 5C

AQUATIC POPULATIONS
Uptake of Natural Radioisotopes by Aquatic Organisms,
W74-06534 5C

AQUATIC PROCESS SIMULATOR
A Physical Model for Simulation of Aquatic Ecosystems,
W74-06573 5C

AQUATIC WEED CONTROL
Basic Research in the Aquatic Environment: Effects of Eutrophication on Phytoplankton Populations and Selected Species of Aquatic Vascular Plants,
W74-06835 5C

AQUATIC WEEDS
Processing, Chemical Composition and Nutritive Value of Aquatic Weeds,
W74-06502 4A

AQUEOUS SOLUTIONS
Complexim etric Determination of Phosphate,
W74-06757 5A

Selectrode - the Universal Ion-Selective Electrode. Part VII. A Valinomycin-Based Potassium Electrode with Nonporous Polymer Membrane and Solid-State Inner Reference System,
W74-06765 5A

New Spot Tests for Nitrates and Nitrites,
W74-06878 5A

AQUICULTURE
Legal and Administrative Aspects of an Aquaculture Policy for Hawaii, An Assessment,
W74-06992 6E

AQUIFER CHARACTERISTICS
Ground-Water Hydrology of Northern Napa Valley, California,
W74-06880 2F

ARCTIC
An Expanding Role for Subarctic Watershed Research,
W74-06884 4D

ARID LANDS
Applications of Remote Sensing (ERTS) to Resource Management and Development in Sahelien Africa (Republic of Mali),
W74-06686 4A

ARIZONA
Change in Land Use in the Phoenix (1:250,000) Quadrangle, Arizona between 1970 and 1972: Successful Use of a Proposed Land Use Classification System,
W74-06622 4A

ARSENIC
Distribution and Circulation of Arsenic Through Water, Organisms and Sediments of Lake Michigan,
W74-07046 5B

ARTEMIA
Using Artemia to Assay Oil Dispersant Toxicities,
W74-06877 5A

ARTESIAN AQUIFERS
A Discrete Space Continuous Time Modeling Approach to Nonsteady Flow in a Leaky Aquifer System of Finite Configuration,
W74-06887 2F

On the Leakage Assumption Applied to Equations of Groundwater Flow,
W74-06888 2F

ARTIFICIAL RECHARGE
A Physical Model for Prediction and Control of Saltwater Intrusion in the Floridan Aquifer,
W74-06609 2F

Ground-Water Recharge Strip Basin-Experiments,
W74-06740 4B

ASPHALT
Development of Asphalt Moisture Barrier Equipment,
W74-06586 3F

ASSAY
(Radiation Data, Section II. Water).
W74-06856 5A

Using Artemia to Assay Oil Dispersant Toxicities,
W74-06877 5A

ATLANTIC OCEAN
Oceanographic Features in the Lee of the Windward and Leeward Islands: ERTS and Ship Data,
W74-06674 2E

ATOMIC ABSORPTION
Atomic Absorption Detector for Liquid-Liquid Chromatography,
W74-06998 5A

An Atomic Absorption Analysis Method for Cyanide,
W74-06999 5A

ATOMIC ABSORPTION SPECTROPHOTOMETRY
Determination of Mercury in Biological Tissues,
W74-06790 5A

ATTITUDES
Intergovernmental Relations as seen by Florida State Legislators: Land Use and Water Resource Problems,
W74-06845 6B

AUSTRALIA
Effect of Plant Growth and Form of Nitrogen Fertilizer on Dentrification from Four South Australian Soils,
W74-07039 2G

AUSTRALIA (MACLEAY RIVER)
Seasonal and Stratigraphic Controls in Coastal Floodplain Soils,
W74-07030 2G

AUTOMATIC CONTROL
Automatic Processing and Verification of Meteorological Observations.
W74-06722 2B

Fundamentals of Automatic Control of Meteorological Data,
W74-06724 2B

Automatic Monitoring of Daily Results of Basic Meteorological Observations,
W74-06727 2B

Automatic Method of Monitoring the Quality of Mean Monthly Meteorological Data,
W74-06728 2B

Automatic Monitoring of Processing of Daily Radiosonde Data on Temperature and Geopotential,
W74-06729 2B

Automatic Monitoring and Processing of Hourly Hydrometeorological Information,
W74-06730 2B

Automatic Processing of Rainfall Data,
W74-06732 2B

Digital Control Algorithms. Part III. Tuning PI and PID Controllers,
W74-06750 7C

AUTOMATIC EQUIPMENT
A Simple Automatic Soil Percolator,
W74-06531 7B

BACKWATER
Annual Cycle of Zooplankton in Backwaters of the Flood Area of the Dyje,
W74-06536 5C

BALANCE OF NATURE
Three-Year Evolution,
W74-06970 6G

BALANTIDIASIS
Balantidiasis Outbreak in Truk,
W74-07031 5C

BALTIMORE HARBOR
Distribution of Metals in Baltimore Harbor Sediments,
W74-06924 5B

BASELINE STUDIES
Effects of Ground-Water Development on the Proposed Palmetto Bend Dam and Reservoir in Southeast Texas,
W74-06920 4B

BASS
The Effects of Ecological Changes on Buckeye Lake, Ohio, with Emphasis on Largemouth Bass and Aquatic Vascular Plants,
W74-06546 5C

BASS (STRIPED)
An Evaluation of Striped Bass Fingerling Culture,
W74-07002 8I

BATHYMETRY
Water Depth Estimation with ERTS-1 Imagery,
W74-06680 2L

Calculations of Water Depth From ERTS-MSS Data,
W74-06681 2E

BEACH EROSION
Seasonal Changes of Littoral Transport and Beach Width and Resulting Effect on Protective Structures,
W74-06664 2L

Recognition of Beach and Nearshore Depositional Features of Chesapeake Bay,
W74-06665 2L

BEAUFORT SEA
Investigations Performed on the Arctic Ice Dynamics Joint Experiment, March 1971,
W74-06716 2C

Mesoscale Strain Measurements on the Beaufort Sea Pack Ice,
W74-06717 2C

Structure of a Multiyear Pressure Ridge,
W74-06718 2C

Top and Bottom Roughness of a Multiyear Ice Floe,
W74-06719 2C

Airphoto Analysis of Ice Deformation in the Beaufort Sea,
W74-06720 2C

Data on Morphological and Physical Characteristics of Sea Ice in the Beaufort Sea,
W74-06721 2C

BENEFICIAL USE
Use of Waste Heat for Soil Warming in North Carolina,
W74-07000 5D

BENEFITS
A Review of Soviet Data on the Peaceful Uses of Nuclear Explosions,
W74-06823 6B

BENTHIC FAUNA
Macrobenthos of Ponds with Sugar Factory Wastes,
W74-06553 5C

Stream Pollution and a Simplified Diversity Index,
W74-06876 5A

BENTHOS
The Effects of Waste Disposal in the New York Bight. Sections 7, 8, and 9.
W74-06868 5C

BENTONITE
Electro-Osmotic Effects in a Bentonite-Water System,
W74-06910 2K

BIBLIOGRAPHIES
Evaporation Suppression, A Bibliography.
W74-06501 3D

Cyanophages - Viruses Attacking Blue-Green Algae,
W74-06754 5C

Methods of Analysis for Mercury and its Compounds: A Review,
W74-06785 5A

Bibliography of Water Management.
W74-06854 3F

Environmental Aspects of Plutonium and Other Elements, a Selected Annotated Bibliography.
W74-06857 5C

The Effects of Waste Disposal in the New York Bight. Sections 7, 8, and 9.
W74-06868 5C

BIOASSAY
Effects of Oil Dispersants and Oil Emulsions on Marine Animals,
W74-06745 5C

Chemical Aspects of Bioassay Techniques for Establishing Water Quality Criteria,
W74-06747 5A

Temperature Control of Reproduction and Productivity in a Subarctic Coralline Alga,
W74-06751 5C

Lead Inhibition of Hormotila blennista (Chlorophyceae, Chlorococcales),
W74-06761 5C

Mercury as a Hydrospheric Pollutant II. Biological Half-Time of Methyl Mercury in Four Mediterranean Species: A Fish, a Crab, and Two Molluscs,
W74-06767 5C

Biological Response to Detergent and Nondetergent Phosphorus in Sewage - Part II,
W74-06873 5C

Using Artemia to Assay Oil Dispersant Toxicities,
W74-06877 5A

BIOCHEMICAL OXYGEN DEMAND
Unrecorded Pollution and Dynamics of Biochemical Oxygen Demand,
W74-06613 5B

BIOCHEMISTRY
Detection and Appraisal of Subchronical Intoxications,
W74-06810 5C

BIOGENIC ACTIVITY
Production and Biogenic Activity of Distillates, Filtrates and Extracts from the Pomorie and Atanasovo Lagoon Mud, (In Bulgarian),
W74-07003 2H

BIOINDICATORS
Mercury in Wild Animals, Lake St Clair, 1970,
W74-06776 5B

Stream Pollution and a Simplified Diversity Index,
W74-06876 5A

BIOLOGICAL COMMUNITIES
The Role of Food Chains in Environmental Mercury Contamination,
W74-06795 5B

BIOLOGICAL SAMPLES
Preparation of Biological Samples for Neutron Activation Analysis of Mercury,
W74-06786 5A

BIOLOGICAL TREATMENT
Biological Treatment of Feedlot Runoff,
W74-06847 5D

BIOLOGY
Water Pollution and Biology, (In Polish),
W74-07020 5B

BIOOXIDATION
Oxidation of n-Alkanes by Cladosporium resinae,
W74-06763 5C

BIORTHYMS
Endogenous and Photoperiodic Diurnal Rhythms of in Vivo Light Absorption and Scattering in the Green Alga Ulva Lactuca L.,
W74-06547 5C

BIOSPHERE
Energy Flows in the Biosphere: The Impact of Man,
W74-07043 2B

BIOTA
Phytoplankton Population Changes and Nutrient Fluctuations in a Simple Aquatic Ecosystem Model,
W74-06571 5C

An Ecological Account of the Past and Future of South African Rivers,
W74-06606 5C

Stream Pollution and a Simplified Diversity Index,
W74-06876 5A

BIOTRANSFORMATION
Biotransformation of Organo-Mercurials in Mammals,
W74-06802 5C

BIRDS
Mercury and Food Chains,
W74-06796 5B

Survival and Reproduction of Ring-Necked Pheasants Consuming Two Mercurial Fungicides,
W74-06808 5C

BISCAYNE BAY (FLA)
Origin of Circular Beds of Thalassia (Spermatophyta:Hydrocharitaceae) in South Biscayne Bay, Florida, and Their Relationship to Mangrove Hammocks,
W74-07022 5A

BLACK SEA
Atlantic Sturgeon (Acipenser sturio) in Waters of Georgia, (In Russian),
W74-07016 2H

BLOOD ANALYSIS
The Determination of Ethylmercury in Blood,
W74-06791 5A

BOG MATS
Preliminary Report of the Role of Sphagnum in the Cycling of Phosphorus in a Bog-Lake System,
W74-06743 5C

BOGS
Organic Phosphorus Compounds of a Northern Michigan Bog, Bog-Lake System,
W74-06742 5C

Ionic State and Coordination of Iron in Bog Lakes,
W74-06744 5C

BOHEMIA (CZECHOSLOVAKIA)
Survey of Reservoirs in Bohemia and Their Water Quality,
W74-06537 5C

BORDER IRRIGATION
Mathematical Model of Water Advance in Border Irrigation,
W74-06582 3F

Hydrodynamics of Border Irrigation Advance,
W74-06592 3F

BORON
Phosphorimetric Determination of Traces of Boron,
W74-06755 5A

BOTTOM SEDIMENTS
Some Comments on Seagrasses and Sedimentary Processes,
W74-06922 2J

The CBI Pogo Stick Corer,
W74-06923 7B

BOUNDARIES (PROPERTY)
Establishment of Mean High Water Lines in Florida Lakes,
W74-06610 2H

BOUNDARIES (SURFACES)
On Squire's Theorem in the Study of Hydrodynamic Stability of Plane-Parallel Flows of Incompressible Fluids about Deforming Boundaries,
W74-06911 8B

BREAKPOINT CHLORINATION
Ammonia-Nitrogen Removal by Breakpoint Chlorination,
W74-06838 5D

BREEDING (MOSQUITOES)
Control of Mosquitoes Breeding in Rice-Fields,
W74-07041 5G

BREWING WATERS (TREATMENT)
Investigation of Brewing Water Treatment,
W74-07023 5A

BRINE EVAPORATION
Evaporation from Brine Storage Reservoirs,
W74-06517 2D

BRINE SHRIMP
Using Artemia to Assay Oil Dispersant Toxicities,
W74-06877 5A

BRINE STORAGE RESERVOIRS
Evaporation from Brine Storage Reservoirs,
W74-06517 2D

BRITISH COLUMBIA
Use of ERTS-1 Pictures in Coastal Oceanography in British Columbia,
W74-06707 2L

BROMEGRASS
Quality Improvement of Feedlot Lagoon Water by Percolation Through Soil Under Native Pasture,
W74-06830 5D

BROMINE
Groundwater Tracing with Post Sampling Activation Analysis,
W74-06889 2F

BUBBLES
Hypolimnion Aeration with Commercial Oxygen - Vol. I - Dynamics of Bubble Plume,
W74-06525 5D

Hypolimnion Aeration with Commercial Oxygen - Vol. II - Bubble Plume Gas Transfer,
W74-06526 5D

BUCKEYE LAKE (OHIO)
The Effects of Ecological Changes on Buckeye Lake, Ohio, with Emphasis on Largemouth Bass and Aquatic Vascular Plants,
W74-06546 5C

BUFFER CAPACITY
Buffer Capacity in Aquatic Ecosystems,
W74-06829 5B

BUFFERING (PH)
Buffer Intensities and Equilibrium pH of Minerals and Soils: 1. The Contribution of Minerals and Aqueous Carbonate to pH Buffering,
W74-06904 2G

Buffer Intensities and Equilibrium pH of Minerals and Soils: II. Theoretical and Actual pH of Minerals and Soils,
W74-06905 2G

BULGARIA
Production and Biogenic Activity of Distillates, Filtrates and Extracts from the Pomorie and Atanasovo Lagoon Mud, (In Bulgarian),
W74-07003 2H

BULK COMMODITIES
U.S. Deepwater Port Study, Vol. 2. Commodity Studies and Projections,
W74-06863 6D

U.S. Deepwater Port Study, Vol 3. Physical Coast and Port Characteristics, and Selected Deepwater Port Alternatives,
W74-06864 6D

BULK DENSITY
Gamma Radiation Measurements of Bulk Density Changes in a Soil Pedon Following Irrigation,
W74-06715 2G

BYPRODUCTS
Recovery of Fatty Materials from Edible Oil Refinery Effluents,
W74-06514 5D

CALCITE
Kinetics of the Phosphate Interaction with Calcite,
W74-06895 5B

CALCIUM
A Universal Ion-Selective Electrode Based on Graphite Paste,
W74-06758 2K

CALCIUM ELECTRODES
Selectrode - the Universal Ion-Selective Electrode. Part VI. The Calcium (II) Selectrode Employing a New Ion Exchanger in a Nonporous Membrane and a Solid-State Reference System,
W74-06764 5A

CALIBRATIONS
Experimental Masking of RBV Images to Reduce Stationary Residual Inaccuracies in Radiometric Correction,
W74-06649 7C

Digital Rectification of ERTS Multispectral Imagery,
W74-06650 7C

Results of Precision Processing (Scene Correction) of ERTS-1 Images Using Digital Image Processing Techniques,
W74-06651 7C

Significant Techniques in the Processing and Interpretation of ERTS-1 Data,
W74-06652 7C

Computer Techniques Used for Some Enhancements of ERTS Images,
W74-06653 7C

Digital Enhancement of Multispectral MSS Data for Maximum Image Visibility,
W74-06654 7C

ERTS-1 Image Enhancement by Optically Combining Density Slices,
W74-06655 7C

Digital Interactive Image Analysis by Array Processing,
W74-06657 7C

Combining Human and Computer Interpretation Capabilities to Analyze ERTS Imagery,
W74-06658 7C

Analysis of ERTS Imagery Using Special Electronic Viewing/Measuring Equipment,
W74-06659 7C

Combined Spectral and Spatial Processing of ERTS Imagery Data,
W74-06660 7C

Terrain Type Recognition Using ERTS-1 MSS Images,
W74-06661 7C

Classification of ERTS-1 MSS Data by Canonical Analysis,
W74-06662 7C

DCP-Collected Absolute Target Reflectance Signatures Assist Accurate Interpretation of ERTS-1 Imagery,
W74-06688 7C

CALIBRATIONS

Computed Atmospheric Effects on ERTS Observations,
W74-06694 2B

The Evaporation from a Water Pan--Its Limited Significance (L'evaporation d'un bac d'eau libre--sa signification restreinte),
W74-06908 2D

CAYUGA LAKE (NEW YORK)
The Runoff of Water and Nutrients from Watersheds Tributary to Cayuga Lake, New York,
W74-06848 5B

Water and Nutrient Budgets for Cayuga Lake, New York,
W74-06849 5B

CEDAR RIVER (WASH)
Studies of the Forest Energy Budget,
W74-06518 2D

CENTER-PIVOT SPRINKLERS
Pasture Irrigation with a Center-Pivot Sprinkler System,
W74-06601 3F

CENTER PIVOT SYSTEM
Hydraulics of a Center Pivot System,
W74-06583 3F

CENTRIFUGATION
Recovery of Fatty Materials from Edible Oil Refinery Effluents,
W74-06514 5D

Method of Preparing Washed Suspensions of Anaerobic Bacteria for Metabolic Studies,
W74-06875 5A

CERATOPHYLLUM
Nitrogen Turnover in Impoundments,
W74-06505 5C

CESIUM
Estimating Soil Erosion from the Redistribution of Fallout Cs-137,
W74-06901 2J

CHAIN PICKEREL
Spring Food of Chain Pickerel (Esox niger) in Maine Lakes,
W74-07032 2H

CHARTS
A Chart of New York Water Law,
W74-06614 6E

CHELATING AGENTS
Atomic Absorption Detector for Liquid-Liquid Chromatography,
W74-06998 5A

CHELATION
Atomic Absorption Detector for Liquid-Liquid Chromatography,
W74-06998 5A

CHEMICAL ANALYSIS
Chemical Aspects of Bioassay Techniques for Establishing Water Quality Criteria,
W74-06747 5A

New Spot Tests for Nitrates and Nitrites,
W74-06878 5A

CHEMICAL PROCESSING
The Stack Monitoring System at the Idaho Chemical Processing Plant,
W74-06824 5A

CHEMICAL PROPERTIES
Studies on the Phytoplankton Ecology of the Trondheimsfjord. I. The Chemical Composition of Phytoplankton Populations,
W74-06545 5C

CHEMICAL REACTIONS
Factors in the Transformation of Mercury to Methylmercury,
W74-06794 5B

Buffer Capacity in Aquatic Ecosystems,
W74-06829 5B

CHEMICAL TREATMENT
Demonstration of a Non-Aqueous Sewage Disposal System,
W74-06519 5D

CHEMICAL WASTES
Sources of Mercury in the Environment,
W74-06771 5B

The Effects of Waste Disposal in the New York Bight. Section 3: Zooplankton Studies.

Radar Studies of Urban Precipitation Anomaly,
W74-06938 2B

Observations of the Cloud Nucleus Concentration Around the St. Louis Urban Complex,
W74-06939 2B

Upwind and Downwind Cloud-Base Microstructure,
W74-06940 2B

Metromex Temperature and Aerosol Data Reduction: Analysis of the Urban Anomaly,
W74-06941 2B

CHESAPEAKE BAY
Seasonal Changes of Littoral Transport and Beach Width and Resulting Effect on Protective Structures,
W74-06664 2L

Recognition of Beach and Nearshore Depositional Features of Chesapeake Bay,
W74-06665 2L

Correlation of ERTS Multispectral Imagery with Suspended Matter and Chlorophyll in Lower Chesapeake Bay,
W74-06667 2L

Distribution of Metals in Baltimore Harbor Sediments,
W74-06924 5B

CHINOOK SALMON
Social Interaction Between Juvenile Coho (Oncorhynchus kisutch) and Fall Chinook Salmon (O. tshawytscha) in Sixes River, Oregon,
W74-07040 2I

CHLORELLA
Absence of Oxygen-Evolving Capacity in Dark-Grown Chlorella: The Photoactivation of Oxygen-Evolving Centers,
W74-06544 5C

CHLORIDES
A Universal Ion-Selective Electrode Based on Graphite Paste,
W74-06758 2K

CHLORINATION
Coliform Bacteria Growth and Control in Aerated Stabilization Basins,
W74-06520 5D

Ammonia-Nitrogen Removal by Breakpoint Chlorination,
W74-06838 5D

CHLORINE
Chlorine Production Drops as Demand Lags.
W74-06766 5B

CHLOROPHYLL
Correlation of ERTS Multispectral Imagery with Suspended Matter and Chlorophyll in Lower Chesapeake Bay,
W74-06667 2L

Studies on the Photosynthetic Pigments and Their Decomposition in the Sediment of Lake Balaton and Lake Belso,
W74-06741 5C

CHLOROPHYTA
Micro-Ecosystems Simulation of Primary Production in Thermal and Acid Mine Water Loadings Related to Water Use of the Monongahela River,
W74-06507 5C

Culture Studies of Enteromorpha Linza (L.) J.AG. and Ulvaria Oxysperma (Kutzing) Bliding (Chlorophyceae, Ulvales) From Central America,
W74-06749 5C

Horizontal Phytoplankton Studies in Lake Balaton Based on Scooped Samples and Filtrates Taken in 1967,
W74-06756 5C

The Genus Neochloris Starr (Chlorophyceae, Chlorococcales),
W74-06760 5A

CHOCTAWHATCHEE RIVER (FLA)
Choctawhatchee River and Holmes Creek, Florida, Permit Application by Florida Game and Fresh Water Fish Commission (Final Environmental Impact Statement).
W74-06985 4A

CHROMATOGRAPHY
Electron-Donor-Acceptor Complexing Reagents in the Analysis of Pesticides. VI. Influence of Structure in Detection and Identification,
W74-06871 5A

Azide and Ethylenethiourea Mobility in Soils,
W74-06896 5B

Atomic Absorption Detector for Liquid-Liquid Chromatography,
W74-06998 5A

CHRYSOPHYTA
Horizontal Phytoplankton Studies in Lake Balaton Based on Scooped Samples and Filtrates Taken in 1967,
W74-06756 5C

CITIES
Land Use of Northern Megalopolis,
W74-06630 4A

Investigations of an Urban Area and its Locale Using ERTS-1 Data Supported by U-Photography,
W74-06635 4A

First Look Analyses of Five Cycles of ERTS-1 Imagery Over County of Los Angeles: Assessment of Data Utility for Urban Development and Regional Planning,
W74-06636 4A

Preparation of Urban Land Use Inventories by Machine-Processing of ERTS MSS Data,
W74-06637 4A

A Comparison of Land-Use Determinations Using Data from ERTS-1 and High Altitude Aircraft,
W74-06638 4A

University of Chicago Contribution to Project Metromex-I.
W74-06937 2B

Radar Studies of Urban Precipitation Anomaly,
W74-06938 2B

Observations of the Cloud Nucleus Concentration Around the St. Louis Urban Complex,
W74-06939 2B

Upwind and Downwind Cloud-Base Microstructure,
W74-06940 2B

Metromex Temperature and Aerosol Data Reduction: Analysis of the Urban Anomaly,
W74-06941 2B

An Epidemiological Study on Clonorchiasis in Kyoto City, (In Japanese),
W74-07050 5C

CITY PLANNING
Use of ERTS-1 Data for Regional Planning in the Metropolitan Washington Council of Governments--A Short Brief,
W74-06700 4A

CLADOSPORIUM RESINAE
Oxidation of n-Alkanes by Cladosporium resinae,
W74-06763 5C

CLARIFICATION
Activated Sludge Treatment Systems with Oxygen,
W74-06839 5D

CLATHROMORPHUM CIRCUMSCRIPTUM
Temperature Control of Reproduction and Productivity in a Subarctic Coralline Alga,
W74-06751 5C

CLAYS
The Influence of Clay Fraction on the Basic Parameters of the Hydro-Transport of Fine Free-Flowing Materials,
W74-06914 8B

Thermodynamics of Ion Exchange,
W74-06936 2G

CLEAR-CUTTING
Multidisciplinary Application of ERTS-1 Data to North Carolina Natural Resource Management,
W74-06682 4C

CLIMATES
Physical Microclimates of Erosion-Control Structures in a Salt Desert Area,
W74-07029 2G

CLIMATIC DATA
Climatic Data of the High Altitude Meteorological Stations of the Geneva Region For 1970, (In French),
W74-06532 7C

Automatic Processing and Verification of Meteorological Observations.
W74-06722 2B

Computer Monitoring of Precipitation in Hungary,
W74-06726 2B

CLIMATOLOGY
Determination of Aerosol Content in the Atmosphere,
W74-06647 7C

Analysis of the Concentration of Microparticles in the Long Ice Core from Byrd Station,
W74-06931 2C

CLONORCHIASIS
An Epidemiological Study on Clonorchiasis in Kyoto City, (In Japanese),
W74-07050 5C

COACHELLA VALLEY (CALIF)
Land Use in Northern Coachella Valley,
W74-06624 4A

COAL MINE ACIDS
An Appraisal of Neutralization Processes to Treat Coal Mine Drainage,
W74-06512 5D

COAL MINE WASTES
The Impact of Slimes-Dam Formation on Water Quality and Pollution,
W74-06604 5B

COAL MINES
Identification and Mapping of Coal Refuse Banks and Other Targets in the Anthracite Region,
W74-06642 4A

COARSE SEDIMENTS
Distribution of Average Longitudinal Velocities in Flows with Coarse-Grained Materials,
W74-06915 8B

Energy Losses in a Two-Phase Flow Containing Coarse-Grain Material,
W74-06916 8B

COASTAL MARSHES
The Present and Future Status of Eastern North Carolina Wetlands,
W74-06850 2L

Coastal Wetlands in New England,
W74-06967 5G

COASTAL WATERS
Recent Developments in the Law of the Sea IV: A Synopsis,
W74-06965 6E

Ratification of Proposed Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter (Final Environmental Impact Statement).
W74-06994 6E

COASTS
Coastal and Submarine Features on MSS Imagery of Southeastern Massachusetts: Comparison with Conventional Maps,
W74-06679 2L

Cooperative Gulf of Mexico Estuarine Inventory and Study, Florida: Phase I Area Description,
W74-06995 2L

COHO SALMON
Social Interaction Between Juvenile Coho (Oncorhynchus kisutch) and Fall Chinook Salmon (O. tshawytscha) in Sixes River, Oregon,
W74-07040 2I

COLD RESISTANCE
Growth of Streptococcus cremoris and Streptococcus lactis in a Chemostat. Production of Cells and Survival of Bacteria during Frozen Storage,
W74-06762 5C

COLIFORMS
Coliform Bacteria Growth and Control in Aerated Stabilization Basins,
W74-06520 5D

COLLEGES
Water Resources Research Interests in the Colleges and Universities of North Carolina.
W74-06616 9A

COLOR REMOVAL
Color Removal from Kraft Mill Effluents by Ultrafiltration,
W74-06521 5D

COLORADO
A Large Undisturbed, Weighing Lysimeter for Grassland Studies,
W74-06581 2G

Hydrologic Data from the Piceance Basin, Colorado.
W74-06714 4B

COLORADO RIVER BASIN
Quality of Ground Water in the Lower Colorado River Region, Arizona, Nevada, New Mexico, and Utah,
W74-06960 7C

COLUMBIA
Culture Studies of Enteromorpha Linza (L.) J.AG. and Ulvaria Oxysperma (Kutzing) Bliding (Chlorophyceae, Ulvales) From Central America,
W74-06749 5C

COMMERCIAL FISHING
Recent Developments in the Law of the Sea IV: A Synopsis,
W74-06965 6E

COMPARATIVE STUDIES
Observations on Comparative Propensities for Carp Fry Destruction by Adults and Last Instar Preimaginal Stages of Predatory Aquatic Insects,
W74-07044 2I

COMPLEXATION
An Atomic Absorption Analysis Method for Cyanide,
W74-06999 5A

COMPLEXIMETRIC TITRATION
Complexiметric Determination of Phosphate,
W74-06757 5A

COMPONENT ANALYSIS
Component Description and Analysis of Environmental Systems: Oxygen Utilization in Aquatic Microcosms,
W74-06575 5C

COMPONENT DESCRIPTION
Component Description and Analysis of Environmental Systems: Oxygen Utilization in Aquatic Microcosms,
W74-06575 5C

COMPREHENSIVE PLANNING
Final Environmental Statement Related to the Proposed Alvin W. Vogtle Nuclear Plant Units 1, 2, 3, and 4.
W74-06821 5B

COMPUTER MODELS
A Simulated Environmental Model of Temperature, Evaporation, Rainfall, and Soil Moisture,
W74-06591 3F

COMPUTER PROGRAMS
Aquatic Modeling in the Eastern Deciduous Forest Biome, U.S.-International Biological Program,
W74-06572 5C

A Computerized Solution for Bench Leveling Design,
W74-06600 4A

The EXREM III Computer Code for Estimating External Radiation Doses to Populations from Environmental Releases,
W74-06818 5B

Environmental Sciences Division Annual Progress Report for Period Ending September 30, 1973,
W74-06826 5B

CONJUNCTIVE USE
Network Analysis of Conjunctively Operated Ground Water-Surface Water Systems,
W74-06504 4B

Conjunctive Operation of Southern California Ground Water Basins with the State Water Project,
W74-06943 4B

CONNECTICUT
Plume Development in Long Island Sound Observed by Remote Sensing (ERTS-1),
W74-06668 2L

CONNECTICUT (LAKE WONONSKOPOMUS)
Effects of Alewives (Alosa pseudoharengus) on the Zooplankton of Lake Wononskopomus, Connecticut,
W74-07033 2H

CONSTRUCTION
The Challenge of Military Nuclear Construction,
W74-06859 8H

CONTROL SYSTEMS
Technical and Economic Evaluation of Cooling System Blowdown Control Techniques,
W74-06510 5D

The Stack Monitoring System at the Idaho Chemical Processing Plant,
W74-06824 5A

COOK INLET (ALAS)
ERTS-1 Observations of Sea Surface Circulation and Sediment Transport, Cook Inlet, Alaska,
W74-06670 2L

Sediment Distribution and Coastal Processes in Cook Inlet, Alaska,
W74-06671 2L

COOLING SYSTEM BLOWDOWN
Technical and Economic Evaluation of Cooling System Blowdown Control Techniques,
W74-06510 5D

COOLING TOWERS
Technical and Economic Evaluation of Cooling System Blowdown Control Techniques,
W74-06510 5D

COORDINATION
Legal Impediments to the Use of Interstate Agreements in Coordinated Fisheries Management Programs: States in the N.M.F.S. Southeast Region,
W74-06991 6E

COPEPODS
The Effects of Waste Disposal in the New York Bight. Section 3: Zooplankton Studies.
W74-06866 5C

COPPER
Interaction of Temperature and Copper Ions as Orienting Stimuli in the Locomotor Behavior of the Goldfish (Carassius auratus),
W74-06769 5C

Efficient Pricing for Urban Waste Water Renovation,
W74-06828 5D

CORE DRILLING
The CBI Pogo Stick Corer,
W74-06923 7B

CORRUGATED PLASTIC TUBING
Hydraulic Roughness of Corrugated Plastic Tubing,
W74-06589 8B

COST ALLOCATION
Efficient Pricing for Urban Waste Water Renovation,
W74-06828 5D

COST ANALYSIS
A Design and Economic Evaluation of Catalytic Oxidation of Phenols in Wastewater,
W74-06516 5D

COST-BENEFIT ANALYSIS
Activity Analysis and the Management of Resources: A Model for Control of Eutrophication,
W74-06574 5C

Deep Plowing - An Engineering Appraisal,
W74-06590 3F

Techniques for Identifying and Evaluating Market and Nonmarket Benefits and Costs of Water Resource Systems.
W74-06852 6B

COST FUNCTIONS
Production Function Theory and the Optimal Design of Waste Treatment Facilities,
W74-06997 6D

COSTA RICA
Culture Studies of Enteromorpha Linza (L.) J.AG. and Ulvaria Oxysperma (Kutzing) Blid-ing (Chlorophyceae, Ulvales) From Central America,
W74-06749 5C

CRABS
Mercury as a Hydrospheric Pollutant II. Biological Half-Time of Methyl Mercury in Four Mediterranean Species: A Fish, a Crab, and Two Molluscs,
W74-06767 5C

CRACKS
Field Measurement of Evaporation from Soil Shrinkage Cracks,
W74-06900 2D

CROP PRODUCTION
A Simulated Environmental Model of Temperature, Evaporation, Rainfall, and Soil Moisture,
W74-06591 3F

Dry and Wet, July-August Rainfall Areas in Iowa,
W74-07045 2B

CRUDE OIL
Effects of Oil Dispersants and Oil Emulsions on Marine Animals,
W74-06745 5C

CRYOLOGY
Investigations Performed on the Arctic Ice Dynamics Joint Experiment, March 1971,
W74-06716 2C

Mesoscale Strain Measurements on the Beaufort Sea Pack Ice,
W74-06717 2C

Structure of a Multiyear Pressure Ridge,
W74-06718 2C

Top and Bottom Roughness of a Multiyear Ice Floe,
W74-06719 2C

Airphoto Analysis of Ice Deformation in the Beaufort Sea,
W74-06720 2C

Data on Morphological and Physical Characteristics of Sea Ice in the Beaufort Sea,
W74-06721 2C

CULTIVATION
Evaluation of a Furrow Modifying Device,
W74-06588 3F

Deep Plowing - An Engineering Appraisal,
W74-06590 3F

Soil and Water Losses as Affected by Tillage Practices,
W74-06595 3F

CULTURE MEDIA
Growth of Streptococcus cremoris and Streptococcus lactis in a Chemostat. Production of Cells and Survival of Bacteria during Frozen Storage,
W74-06762 5C

CULTURES
Culture Studies of Enteromorpha Linza (L.) J.AG. and Ulvaria Oxysperma (Kutzing) Blid-ing (Chlorophyceae, Ulvales) From Central America,
W74-06749 5C

An Examination of Three Strains of the Blue-Green Algal Genus, Fremyella,
W74-06759 5C

Oxidation of n-Alkanes by Cladosporium resinae,
W74-06763 5C

An Evaluation of Striped Bass Fingerling Culture,
W74-07002 8I

CYANIDE
Investigation of Treating Electroplaters Cyanide Waste by Electrodialysis,
W74-06522 5D

An Atomic Absorption Analysis Method for Cyanide,
W74-06999 5A

CYANOPHAGES
Cyanophages - Viruses Attacking Blue-Green Algae,
W74-06754 5C

CYANOPHYTA
Cyanophages - Viruses Attacking Blue-Green Algae,
W74-06754 5C

An Examination of Three Strains of the Blue-Green Algal Genus, Fremyella,
W74-06759 5C

CYCLES
Annual Cycle of Zooplankton in Backwaters of the Flood Area of the Dyje,
W74-06536 5C

CYCLING NUTRIENTS
Some Aspects of Phosphorus Dynamics of the Twin Lakes Watershed,
W74-06565 5C

The Role of Thermocline Migration in Regulating Algal Blooms,
W74-06566 5C

Rates of Carbon, Oxygen, Nitrogen, and Phosphorus Cycling Through Microbial Populations in Stratified Lakes,
W74-06569 5C

Preliminary Report of the Role of Sphagnum in the Cycling of Phosphorus in a Bog-Lake System,
W74-06743 5C

CYTOLOGICAL STUDIES
Culture Studies of Enteromorpha Linza (L.) J.AG. and Ulvaria Oxysperma (Kutzing) Blid-ing (Chlorophyceae, Ulvales) From Central America,
W74-06749 5C

Growth of Streptococcus cremoris and Streptococcus lactis in a Chemostat. Production of Cells and Survival of Bacteria during Frozen Storage,
W74-06762 5C

CZECHOSLOVAKIA (HRON RIVER)
Natural Phytocenoses of the River Littoral in the Lower Reaches of the River Hron,
W74-06550 2I

DAMS
Woodcock Creek Lake, French Creek Basin, Pennsylvania (Final Environmental Impact Statement).
W74-06986 8A

DAPHNIA
Tertiary Treatment with a Controlled Ecological System.
W74-06524 5D

Energetics of Daphnia Ambigua,
W74-06831 5C

DAPHNIA-PULICARIA
The Effect of Season and Animal Size on the Caloric Content of Daphnia pulicaria Forbes,
W74-07038 2H

DARK GROWN
Absence of Oxygen-Evolving Capacity in Dark-Grown Chlorella: The Photoactivation of Oxygen-Evolving Centers,
W74-06544 5C

DATA
Investigation of Mercury Contamination in the Tennessee Valley Region,
W74-06780 5B

DATA COLLECTIONS
Multidisciplinary Application of ERTS-1 Data to North Carolina Natural Resource Management,
W74-06682 4C

Unique Characteristics of ERTS,
W74-06689 7B

ERTS-1 Applied for Structural and Morphological Investigations Case Studies: (1) Los Angeles, California and (2) Coastal Plain, New Jersey,
W74-06690 7C

Detection of Turbidity Dynamics in Tampa Bay, Florida Using Multispectral Imagery from ERTS-1,
W74-06711 2L

DATA PROCESSING
Automatic Interpretation of ERTS Data for Forest Management,
W74-06643 4A

Atmospheric Effects in ERTS-1 Data, and Advanced Information Extraction Techniques,
W74-06646 7C

Determination of Aerosol Content in the Atmosphere,
W74-06647 7C

A Technique for Correcting ERTS Data for Solar and Atmospheric Effects,
W74-06648 7C

Experimental Masking of RBV Images to Reduce Stationary Residual Inaccuracies in Radiometric Correction,
W74-06649 7C

Digital Rectification of ERTS Multispectral Imagery,
W74-06650 7C

Results of Precision Processing (Scene Correction) of ERTS-1 Images Using Digital Image Processing Techniques,
W74-06651 7C

Significant Techniques in the Processing and Interpretation of ERTS-1 Data,
W74-06652 7C

Computer Techniques Used for Some Enhancements of ERTS Images,
W74-06653 7C

Digital Enhancement of Multispectral MSS Data for Maximum Image Visibility,
W74-06654 7C

ERTS-1 Image Enhancement by Optically Combining Density Slices,
W74-06655 7C

Pseudocolor Transformation of ERTS Imagery,
W74-06656 7C

Digital Interactive Image Analysis by Array Processing,
W74-06657 7C

Combining Human and Computer Interpretation Capabilities to Analyze ERTS Imagery,
W74-06658 7C

Analysis of ERTS Imagery Using Special Electronic Viewing/Measuring Equipment,
W74-06659 7C

Combined Spectral and Spatial Processing of ERTS Imagery Data,
W74-06660 7C

Terrain Type Recognition Using ERTS-1 MSS Images,
W74-06661 7C

Classification of ERTS-1 MSS Data by Canonical Analysis,
W74-06662 7C

In Situ Spectroradiometric Quantification of ERTS Data,
W74-06663 2G

Digital Data Processing of ERTS-1 Imagery of Delaware Bay,
W74-06703 2L

The Use of Photographic Methods in Contrast Enhancement of ERTS-1 Images,
W74-06704 7C

Precision Annotation of Predetermined Primary Sampling Units on ERTS-1 MSS Images,
W74-06705 4A

Unsupervised Classification and Areal Measurement of Land and Water Coastal Features on the Texas Coast,
W74-06706 2L

Automatic Processing and Verification of Meteorological Observations.
W74-06722 2B

Machine Control of the Quality of Observations in Automated Hydrometeorological-Data Processing,
W74-06723 2B

Fundamentals of Automatic Control of Meteorological Data,
W74-06724 2B

Automatic Check and Correction of Meteorological Data in East Germany,
W74-06725 2B

Computer Monitoring of Precipitation in Hungary,
W74-06726 2B

Automatic Monitoring of Daily Results of Basic Meteorological Observations,
W74-06727 2B

Automatic Method of Monitoring the Quality of Mean Monthly Meteorological Data,
W74-06728 2B

Automatic Monitoring of Processing of Daily Radiosonde Data on Temperature and Geopotential,
W74-06729 2B

Automatic Monitoring and Processing of Hourly Hydrometeorological Information,
W74-06730 2B

Some Principles of Objective Control of Marine Meteorological Information,
W74-06731 2B

Automatic Processing of Rainfall Data,
W74-06732 2B

An Algorithm for Monitoring Hydrometeorological Information,
W74-06733 2B

DATING
Establishment of Mean High Water Lines in Florida Lakes,
W74-06610 2H

DECAY
Behavior of Radioiodine in the Environment and in Man,
W74-06862 5B

DECISION MAKING
The Environmental Impulse and its Competitors: Attitudes, Interests, and Institutions at Lake Tahoe,
W74-06843 6E

Production Function Theory and the Optimal Design of Waste Treatment Facilities,
W74-06997 6D

DEEP PLOWING
Deep Plowing - An Engineering Appraisal,
W74-06590 3F

DEEP TILLAGE
Deep Plowing - An Engineering Appraisal,
W74-06590 3F

Deep Plowing and Chemical Amendment Effect on a Sodic Claypan Soil,
W74-06598 3F

DEEPWATER PORTS
U.S. Deepwater Port Study, Vol. 2. Commodity Studies and Projections,
W74-06863 6D

U.S. Deepwater Port Study, Vol 3. Physical Coast and Port Characteristics, and Selected Deepwater Port Alternatives,
W74-06864 6D

DEFICIENCY SYMPTOMS
Qualitative Requirements of Young Eels Anguilla japonica for Water-Soluble Vitamins and Their Deficiency Symptoms,
W74-07006 5C

DELAWARE BAY
Applicability of ERTS-1 Imagery to the Study of Suspended Sediment and Aquatic Fronts,
W74-06666 2L

Digital Data Processing of ERTS-1 Imagery of Delaware Bay,
W74-06703 2L

DEMAND
Chlorine Production Drops as Demand Lags.
W74-06766 5B

DEMONSTRATION WATERSHEDS
Some Aspects of Phosphorus Dynamics of the Twin Lakes Watershed,
W74-06565 5C

DENDROCHRONOLOGY
Establishment of Mean High Water Lines in Florida Lakes,
W74-06610 2H

Recent Activity of Glaciers of Mount Rainier, Washington,
W74-06713 2C

DENITRIFICATION
Nitrogen Elimination by Bogus Alternation of Aerobic/'Anoxic' Conditions in 'Orbal' Activated Sludge Plants,
W74-06605 5D

Denitrification as a Pathway for Nitrate Removal in Aquatic Systems,
W74-06612 5B

DENITRIFICATION (SOILS)
Effect of Plant Growth and Form of Nitrogen Fertilizer on Dentrification from Four South Australian Soils,
W74-07039 2G

DEPTH
Water Depth Estimation with ERTS-1 Imagery,
W74-06680 2L

Calculations of Water Depth From ERTS-MSS Data,
W74-06681 2E

DESIGN
Component Description and Analysis of Environmental Systems: Oxygen Utilization in Aquatic Microcosms,
W74-06575 5C

DESIGN CRITERIA
Design Criteria for Irrigation Systems with Complex Pipe Loops,
W74-06585 3F

A Universal Ion-Selective Electrode Based on Graphite Paste,
W74-06758 2K

DETERGENTS
Report of the Expert Group on Detergents.
W74-06554 5C

DETROIT
Digital Land Use Mapping in Oakland County, Michigan,
W74-06639 4A

DEW
The Role of Dew in the Seasonal Moisture Balance of a Summer-Dry Climate,
W74-07037 2B

DIALYSIS
Investigation of Treating Electroplaters Cyanide Waste by Electrodialysis,
W74-06522 5D

DIATOMS
Benthic Algae in Water of the Neouvielle Massif (Hautes-Pyrenees),
W74-07013 2H

DIETS
The Occurrence of Mercury in the Environment and Man, Discussion Paper,
W74-06784 5B

The Dose-Response Relationship Resulting from Exposure to Alkyl Mercury Compounds,
W74-06805 5C

Mercury Concentrations in Human Tissues Among Heavy Fish Eaters,
W74-06812 5B

DIGITAL CONTROL
Digital Control Algorithms. Part III. Tuning PI and PID Controllers,
W74-06750 7C

DISASTERS
Emergency Planning for Municipal Wastewater Treatment Facilities,
W74-06577 5D

DISCHARGE (WATER)
The Problem of Direct Groundwater Discharge to the Seas,
W74-06881 2F

DISCRETE DIFFERENTIAL DYNAMIC PROGRAMMING
Application of DDDP in Water Resources Planning,
W74-06503 6A

DISINFECTION
Coliform Bacteria Growth and Control in Aerated Stabilization Basins,
W74-06520 5D

DISPERSION
Distribution and Mixing of Inflow into Stratified Lakes: A Hydraulic Model Study, (Phase I),
W74-06618 2H

Mathematical Model for Barged Ocean Disposal of Wastes,
W74-06837 5B

On the Selection of a Ground Disposal Site by Sensitivity Analysis,
W74-06858 5B

DISSOLVED OXYGEN
Utilization of Oxygen in Estuaries,
W74-06540 5C

DISTRIBUTION
Distribution of Mercury in the Environment of Minamata Bay and the Inland Ariake Sea,
W74-06781 5B

Distribution of Mercury in Residual Soils,
W74-06797 5B

Biological Effects of Mercury Compounds, Discussion Paper,
W74-06814 5C

Distribution and Seasonal Variations of the Plankton in 'Riviere de Morlaix,' (In French),
W74-07012 5C

Soil Moisture Distribution During Two-Dimensional Absorption from a Cylindrical Source,
W74-07042 2G

DISTRIBUTION PATTERNS
Distribution and Mixing of Inflow into Stratified Lakes: A Hydraulic Model Study, (Phase I),
W74-06618 2H

Some Estimates of Natural Levels of Mercury in the Environment,
W74-06772 5B

Survey of Mercury Concentrations in Fishes of Lakes St. Clair, Erie, and Huron,
W74-06775 5B

Mercury Contents of Bottom Sediments from Wisconsin Rivers and Lakes,
W74-06777 5B

Mercury in the Lake Michigan Environment,
W74-06779 5B

Distribution of Metals in Baltimore Harbor Sediments,
W74-06924 5B

DISTRICT OF COLUMBIA
Physical-Chemical Treatment of Raw Municipal Wastewater,
W74-06509 5D

Use of ERTS-1 Data for Regional Planning in the Metropolitan Washington Council of Governments--A Short Brief,
W74-06700 4A

Ammonia-Nitrogen Removal by Breakpoint Chlorination,
W74-06838 5D

Activated Sludge Treatment Systems with Oxygen,
W74-06839 5D

Laboratory Ozonation of Muncipal Wastewaters,
W74-06840 5D

Nitrogen Removal by Ammonia Stripping,
W74-06842 5D

DIVERSION
Predicting the Effects of Nutrient Diversion on Lake Recovery,
W74-06576 5C

DOMESTIC WASTES
Treatment of Domestic Wastewater and NSSC Pulp and Paper Mill Wastes,
W74-06513 5D

Sewage Collection Facilities.
W74-06980 6E

DOSE CALCULATIONS
On the Selection of a Ground Disposal Site by Sensitivity Analysis,
W74-06858 5B

DOSE RATE (RADIATION)
The EXREM III Computer Code for Estimating External Radiation Doses to Populations from Environmental Releases,
W74-06818 5B

DOUGLAS FIR TREES
Studies of the Forest Energy Budget,
W74-06518 2D

DRAINAGE
Performance of a Tile Drainage System: An Evaluation of a Tile Design and Management,
W74-06596 3F

Application of Monte Carlo Method to Soil Water Movement,
W74-06599 2G

Drainage.
W74-06983 6E

Patterson Watershed Project, Stanislaus County, California (Final Environmental Impact Statement).
W74-06987 4A

DRAINAGE DISTRICTS
Drainage Districts.
W74-06972 6E

Drainage.
W74-06983 6E

DRAINAGE EFFECTS
Performance of a Tile Drainage System: An Evaluation of a Tile Design and Management,
W74-06596 3F

DRAINAGE PRACTICES
Performance of a Tile Drainage System: An Evaluation of a Tile Design and Management,
W74-06596 3F

DRAWDOWN
A Physical Model for Prediction and Control of Saltwater Intrusion in the Floridan Aquifer,
W74-06609 2F

DREDGE SPOILS
Mathematical Model for Barged Ocean Disposal of Wastes,
W74-06837 5B

DROUGHT RESPONSE (PLANTS)
An Ecological Study of Vellozia schnitzleinia, a Drought-Enduring Plant of Northern Nigeria,
W74-06768 2I

DRUGS
Survival in Maturation Ponds of Coliform Bacteria With Transferable Drug Resistance,
W74-06748 5C

DRY CLIMATES
The Role of Dew in the Seasonal Moisture Balance of a Summer-Dry Climate,
W74-07037 2B

DRY RESIDUE
Influence of Some Hydrological Parameters on Changes in the Radioactivity of the Waters of the Rivers Czarna Przemsza and Przemsza,
W74-07019 5B

DUAL TREATMENT
Utilization of Trickling Filters for Dual Treatment of Dry and Wet Weather Flows,
W74-06508 5D

DUPUIT-FORCHHEIMER THEORY
Ground-Water Recharge Strip Basin-Experiments,
W74-06740 4B

DUSTS
Analysis of the Concentration of Microparticles in the Long Ice Core from Byrd Station,
W74-06931 2C

DYJE RIVER (CZECHOSLOVAKIA)
Annual Cycle of Zooplankton in Backwaters of the Flood Area of the Dyje,
W74-06536 5C

DYNAMIC PROGRAMMING
Application of DDDP in Water Resources Planning,
W74-06503 6A

DYNAMICS
Modeling Algal Growth Dynamics in Shagawa Lake, Minnesota, with Comments Concerning Projected Restoration of the Lake,
W74-06563 5C

DYSTROPHY
Organic Phosphorus Compounds of a Northern Michigan Bog, Bog-Lake System,
W74-06742 5C

E
Survival in Maturation Ponds of Coliform Bacteria With Transferable Drug Resistance,
W74-06748 5C

EASTERN DECIDUOUS FOREST BIOME
Aquatic Modeling in the Eastern Deciduous Forest Biome, U.S.-International Biological Program,
W74-06572 5C

ECOLOGY
The Effects of Ecological Changes on Buckeye Lake, Ohio, with Emphasis on Largemouth Bass and Aquatic Vascular Plants,
W74-06546 5C

Freshwater Biology and Pollution Ecology: Training Manual.
W74-06558 5A

An Ecological Account of the Past and Future of South African Rivers,
W74-06606 5C

Environmental Sciences Division Annual Progress Report for Period Ending September 30, 1973,
W74-06826 5B

Environmental Aspects of Plutonium and Other Elements, a Selected Annotated Bibliography.
W74-06857 5C

Atlantic Sturgeon (Acipenser sturio) in Waters of Georgia, (In Russian),
W74-07016 2H

Urbanization and Human Health,
W74-07017 5G

ECONOMIC IMPACT
Techniques for Identifying and Evaluating Market and Nonmarket Benefits and Costs of Water Resource Systems.
W74-06852 6B

ECOSYSTEMS
Simulation of Urban Runoff, Nutrient Loading, and Biotic Response of a Shallow Eutrophic Lake,
W74-06564 5C

Need for an Ecosystem Perspective in Eutrophication Modeling,
W74-06567 5C

Aquatic Modeling in the Eastern Deciduous Forest Biome, U.S.-International Biological Program,
W74-06572 5C

Environmental Sciences Division Annual Progress Report for Period Ending September 30, 1973,
W74-06826 5B

Environmental Aspects of Plutonium and Other Elements, a Selected Annotated Bibliography.
W74-06857 5C

Energy Flows in the Biosphere: The Impact of Man,
W74-07043 2B

ECTOCARPUS SILICULOSUS
Influence of Iodine on Growth and Development of the Brown Alga Ectocarpus Siliculosus in Axenic Cultures,
W74-06752 5C

EDUCATION
Water Resources Research Interests in the Colleges and Universities of North Carolina.
W74-06616 9A

Annual Report, FY 1973.
W74-06617 9A

EELS
Qualitative Requirements of Young Eels Anguilla japonica for Water-Soluble Vitamins and Their Deficiency Symptoms,
W74-07006 5C

EFFLUENTS
Final Environmental Statement Related to the Proposed Alvin W. Vogtle Nuclear Plant Units 1, 2, 3, and 4.
W74-06821 5B

ELECTRIC POWER
The National Environmental Policy Act and the Licensing Process: Environmentalist Magna Carta or Agency Coup de Grace,
W74-06963 5G

ELECTRO-OSMOSIS
Investigation of Treating Electroplaters Cyanide Waste by Electrodialysis,
W74-06522 5D

Electro-Osmotic Effects in a Bentonite-Water System,
W74-06910 2K

ELECTROCHEMISTRY
Electro-Osmotic Effects in a Bentonite-Water System,
W74-06910 2K

ELECTRODES
A Universal Ion-Selective Electrode Based on Graphite Paste,
W74-06758 2K

Selectrode - the Universal Ion-Selective Electrode. Part VI. The Calcium (II) Selectrode Employing a New Ion Exchanger in a Nonporous Membrane and a Solid-State Reference System,
W74-06764 5A

Selectrode - the Universal Ion-Selective Electrode. Part VII. A Valinomycin-Based Potassium Electrode with Nonporous Polymer Membrane and Solid-State Inner Reference System,
W74-06765 5A

On the Reaction Between Iodide and Mercury(II),
W74-06870 5A

ELECTRODIALYSIS
Investigation of Treating Electroplaters Cyanide Waste by Electrodialysis,
W74-06522 5D

ELECTROMYOGRAPHY
Surface Electromyography in Chronic Inorganic Mercury Intoxication,
W74-06801 5C

ELECTROPLATING
Investigation of Treating Electroplaters Cyanide Waste by Electrodialysis,
W74-06522 5D

ENERGY
Exploring Energy Choices.
W74-06879 6D

ENERGY BALANCE
Energy Flows in the Biosphere: The Impact of Man,
W74-07043 2B

ENERGY BUDGET
Studies of the Forest Energy Budget,
W74-06518 2D

ENERGY FLOWS
Energy Flows in the Biosphere: The Impact of Man,
W74-07043 2B

ENERGY LOSS
Energy Losses in a Two-Phase Flow Containing Coarse-Grain Material,
W74-06916 8B

ENERGY SUPPLY AND DEMAND
Exploring Energy Choices.
W74-06879 6D

ENERGY TRANSFER
Component Description and Analysis of Environmental Systems: Oxygen Utilization in Aquatic Microcosms,
W74-06575 5C

ENGINEERING GEOLOGY
The Law to Govern Deepsea Mining Until Superseded by International Agreement,
W74-06964 6E

Seamounts and Guyots: A Unique Resource,
W74-06966 6E

ENTEROMORPHA LINZA
Culture Studies of Enteromorpha Linza (L.) J.AG. and Ulvaria Oxysperma (Kutzing) Bliding (Chlorophyceae, Ulvales) From Central America,
W74-06749 5C

ENVIRONMENT
A Simulated Environmental Model of Temperature, Evaporation, Rainfall, and Soil Moisture,
W74-06591 3F

Assessment of Southern California Environment From ERTS-1,
W74-06685 4A

Environmental Sciences Division Annual Progress Report for Period Ending September 30, 1973,
W74-06826 5B

Environmental Aspects of Plutonium and Other Elements, a Selected Annotated Bibliography.
W74-06857 5C

Behavior of Radioiodine in the Environment and in Man,
W74-06862 5B

An Expanding Role for Subarctic Watershed Research,
W74-06884 4D

ENVIRONMENTAL CONTROL
Whatever Happened to TVA,
W74-06968 6E

ENVIRONMENTAL EFFECTS
Environmental Mercury Contamination.
W74-06770 5B

Research Needs: Study of the Environmental Dynamics of Mercury,
W74-06798 5B

The Environmental Impulse and its Competitors: Attitudes, Interests, and Institutions at Lake Tahoe,
W74-06843 6E

The National Environmental Policy Act and the Licensing Process: Environmentalist Magna Carta or Agency Coup de Grace,
W74-06963 5G

Three-Year Evolution,
W74-06970 6G

River V. Richmond Metropolitan Authority.
W74-06984 6E

Choctawhatchee River and Holmes Creek, Florida, Permit Application by Florida Game and Fresh Water Fish Commission (Final Environmental Impact Statement).
W74-06985 4A

Woodcock Creek Lake, French Creek Basin, Pennsylvania (Final Environmental Impact Statement).
W74-06986 8A

Patterson Watershed Project, Stanislaus County, California (Final Environmental Impact Statement).
W74-06987 4A

Proposal for Oklawaha River, Ocala National Forest, Florida, (Final Environmental Impact Statement).
W74-06993 4A

Ratification of Proposed Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter (Final Environmental Impact Statement).
W74-06994 6E

ENVIRONMENTAL ENGINEERING
Three-Year Evolution,
W74-06970 6G

ENVIRONMENTAL IMPACT STATEMENT
Three-Year Evolution,
W74-06970 6G

Conservationists Go to Court--Part 1,
W74-06971 4D

Choctawhatchee River and Holmes Creek, Florida, Permit Application by Florida Game and Fresh Water Fish Commission (Final Environmental Impact Statement).
W74-06985 4A

Woodcock Creek Lake, French Creek Basin, Pennsylvania (Final Environmental Impact Statement).
W74-06986 8A

ENVIRONMENTAL IMPACT STATEMENTS
Final Environmental Statement Related to the Proposed Alvin W. Vogtle Nuclear Plant Units 1, 2, 3, and 4.
W74-06821 5B

Patterson Watershed Project, Stanislaus County, California (Final Environmental Impact Statement).
W74-06987 4A

Hurricane Creek Watershed Project, Humphreys and Dickson Counties, Tennessee (Final Environmental Impact Statement).
W74-06988 4D

Lower Klamath River Flood Control Project, Del Norte County, California (Final Environmental Impact Statment).
W74-06989 4A

Nutwood Watershed, Illinois (Final Environmental Statement).
W74-06990 4A

Proposal for Oklawaha River, Ocala National Forest, Florida, (Final Environmental Impact Statement).
W74-06993 4A

Ratification of Proposed Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter (Final Environmental Impact Statement).
W74-06994 6E

EPIDEMICS (HUMAN)
Balantidiasis Outbreak in Truk,
W74-07031 5C

EPIDEMIOLOGY
Epidemiological Approaches to the Study of Subclinical Effects of Mercury Intoxication,
W74-06813 5B

An Epidemiological Study on Clonorchiasis in Kyoto City, (In Japanese),
W74-07050 5C

EROSION
Hydrogeomorphology,
W74-06891 2A

EROSION CONTROL
Soil and Water Losses as Affected by Tillage Practices,
W74-06595 3F

Hurricane Creek Watershed Project, Humphreys and Dickson Counties, Tennessee (Final Environmental Impact Statement).
W74-06988 4D

ERROR ANALYSIS
Assessing Systematic Errors in Rainfall-Runoff Models,
W74-06893 2A

ERRORS
Fundamentals of Automatic Control of Meteorological Data,
W74-06724 2B

ERTS
Symposium on Significant Results Obtained From the Earth Resources Technology Satellite-1, Volume I: Technical Presentations, Section B.
W74-06619 7C

Cartographic Quality of ERTS-1 Images,
W74-06620 7C

Progress in Cartography, Eros Program,

FEDERAL PROJECT POLICY

Three-Year Evolution,
W74-06970 6G

FEDERAL WATER POLLUTION CONTROL ACT

The Federal Role and Legislative Trends in Control of Ground Water Quality,
W74-06952 5G

Current State Board Activities in Ground Water Quality Management,
W74-06953 5G

Impact of Water Pollution Control Legislation on Meeting Future Water Needs in California,
W74-06954 5G

Ground Water Pollution--From the Waste Discharger's Viewpoint,
W74-06955 5G

Environmental Quality As an Objective of Ground Water Management,
W74-06956 5B

Will Municipal Sewage Continue to Threaten Primary Water-Contact Recreation: An Appraisal of the 1972 Water Pollution Control Act,
W74-06969 5G

FEED LOTS

Biological Treatment of Feedlot Runoff,
W74-06847 5D

FEEDLOT RUNOFF

Biological Treatment of Feedlot Runoff,
W74-06847 5D

FEEDLOTS

Quality Improvement of Feedlot Lagoon Water by Percolation Through Soil Under Native Pasture,
W74-06830 5D

FERTILIZATION

The Effect of Mineral Fertilization and of Carp Fry on the Composition and Dynamics of Plankton,
W74-06535 5C

FERTILIZER MANUFACTURE

Dynamics of Changes in the Concentration of Fluorine Compounds Emitted by the Phosphorus Fertilizer Manufacturing Establishment in Pozan, and Their Influence on Surface and Underground Waters and on the Atmosphere Within th e Limits of the City of Poznan, (In Polish),
W74-07021 5B

FERTILIZERS

Mineral Nitrogen Movement into Subsoils Following Continued Annual Fertilization for Corn,
W74-06898 5B

Sludge Disposal to Land,
W74-06950 5B

FILTERING RATE (DAPHNIA)

Energetics of Daphnia Ambigua,
W74-06831 5C

FILTRATION

Intermittent Sand Filtration to Upgrade Existing Wastewater Treatment Facilities,
W74-06506 5D

Utilization of Trickling Filters for Dual Treatment of Dry and Wet Weather Flows,
W74-06508 5D

Physical-Chemical Treatment of Raw Municipal Wastewater,
W74-06509 5D

Treatment of Domestic Wastewater and NSSC Pulp and Paper Mill Wastes,
W74-06513 5D

Color Removal from Kraft Mill Effluents by Ultrafiltration,
W74-06521 5D

FINANCING

Area Financing of Water Resource Development in West Minnesota,
W74-06846 6B

Industrial Development--Pollution.
W74-06976 6E

Water Pollution--Summer Intern Program.
W74-06982 6E

FINITE ELEMENT ANALYSIS
Solution of Equation for Vertical Unsaturated Flow of Soil Water,
W74-06736 2G

On the Solution of Transient Free-Surface Flow Problems in Porous Media by the Finite Element Method,
W74-06890 2F

FISH
The Effect of Mineral Fertilization and of Carp Fry on the Composition and Dynamics of Plankton,
W74-06535 5C

Mercury in Fish in the Great Lakes,
W74-06774 5B

Survey of Mercury Concentrations in Fishes of Lakes St. Clair, Erie, and Huron,
W74-06775 5B

Mercury Levels in Wisconsin Fish,
W74-06778 5B

Investigation of Mercury Contamination in the Tennessee Valley Region,
W74-06780 5B

Mercury in Humans in the Great Lakes Region,
W74-06783 5B

A Simple, Rapid Method for the Determination of Trace Mercury in Fish Via Neutron Activation Analysis,
W74-06788 5A

Mercury and Food Chains,
W74-06796 5B

Mercury Concentrations in Human Tissues Among Heavy Fish Eaters,
W74-06812 5B

The Mercury Content of Prehistoric Fish,
W74-07026 5A

FISH BEHAVIOR
Interaction of Temperature and Copper Ions as Orienting Stimuli in the Locomotor Behavior of the Goldfish (Carassius auratus),
W74-06769 5C

FISH CONSERVATION
Recent Developments in the Law of the Sea IV: A Synopsis,
W74-06965 6E

FISH FOODS
Spring Food of Chain Pickerel (Esox niger) in Maine Lakes,
W74-07032 2H

FISH HATCHERIES
Relative Recoveries of Hatchery-Reared Landlocked Salmon Planted at Different Ages at Schoodic Lake, Maine,
W74-06865 8I

An Evaluation of Striped Bass Fingerling Culture,
W74-07002 8I

FISH POPULATIONS
Oxygen in Estuaries: Requirements for Fisheries,
W74-06542 5C

FISHERIES
Application of ERTS-1 Imagery to the Harvest Model of the U.S. Menhaden Fishery,
W74-06678 2L

Relationships Between Remotely Sensed Fisheries Distribution Information and Selected Oceanographic Parameters in the Mississippi Sound,
W74-06708 7B

FISHES
The Laguna de Vegueta on the Mid-Peruvian Coast and Its Fishes, Particularly Aequidens rivulatus (Guenther 1859), (In German),
W74-07007 2H

FISHKILL
Changes in Water Chemistry Accompanying Summer Fish Kills in Shallow Eutrophic Lakes of Southwest Manitoba,
W74-06541 5C

FLAME PHOTOMETRY
Investigation of Brewing Water Treatment,
W74-07023 5A

FLOCCULATION
Physical-Chemical Treatment of Raw Municipal Wastewater,
W74-06509 5D

Recovery of Fatty Materials from Edible Oil Refinery Effluents,
W74-06514 5D

FLOOD DATA
Flood of October 1972 at Petersburg and Colonial Heights, Virginia,
W74-06957 7C

FLOOD DISCHARGE
Flood of October 1972 at Petersburg and Colonial Heights, Virginia,
W74-06957 7C

FLOOD FREQUENCY
On Flood Probabilities of East Alpine Rivers,
W74-06909 2E

FLOOD PEAK
Sensitivity of Surface Runoff to Variations of Watershed Parameters in Small Urban Areas-A Kinematic Model,
W74-06853 4C

FLOOD PLAINS
Annual Cycle of Zooplankton in Backwaters of the Flood Area of the Dyje,
W74-06536 5C

Seasonal and Stratigraphic Controls in Coastal Floodplain Soils,
W74-07030 2G

FLOOD PROTECTION
Woodcock Creek Lake, French Creek Basin, Pennsylvania (Final Environmental Impact Statement).
W74-06986 8A

Lower Klamath River Flood Control Project, Del Norte County, California (Final Environmental Impact Statment).
W74-06989 4A

FLORIDA
A Physical Model for Prediction and Control of Saltwater Intrusion in the Floridan Aquifer,
W74-06609 2F

Establishment of Mean High Water Lines in Florida Lakes,
W74-06610 2H

Detection of Turbidity Dynamics in Tampa Bay, Florida Using Multispectral Imagery from ERTS-1,
W74-06711 2L

Choctawhatchee River and Holmes Creek, Florida, Permit Application by Florida Game and Fresh Water Fish Commission (Final Environmental Impact Statement).
W74-06985 4A

Proposal for Oklawaha River, Ocala National Forest, Florida, (Final Environmental Impact Statement).
W74-06993 4A

Cooperative Gulf of Mexico Estuarine Inventory and Study, Florida: Phase 1 Area Description,
W74-06995 2L

Origin of Circular Beds of Thalassia (Spermatophyta:Hydrocharitaceae) in South Biscayne Bay, Florida, and Their Relationship to Mangrove Hammocks,
W74-07022 5A

Florida Mangroves as Shoreline Stabilizers,
W74-07047 4A

FLOW
Changes in Water Yield of Small Watersheds by Agricultural Practices,
W74-06597 2E

On Squire's Theorem in the Study of Hydrodynamic Stability of Plane-Parallel Flows of Incompressible Fluids about Deforming Boundaries,
W74-06911 8B

Structure of the Velocity Profile of a Suspension-Bearing Flow,
W74-06912 8B

Degree of Local Saturation of a Flow by Suspended Matter and Its Relation to the Volume Concentration,
W74-06913 8B

The Influence of Clay Fraction on the Basic Parameters of the Hydro-Transport of Fine Free-Flowing Materials,
W74-06914 8B

Distribution of Average Longitudinal Velocities in Flows with Coarse-Grained Materials,
W74-06915 8B

Energy Losses in a Two-Phase Flow Containing Coarse-Grain Material,
W74-06916 8B

FLOW MEASUREMENT
Regional Water and Sewer Districts: Rights, Powers and Duties.
W74-06981 6E

FLOW RATES
Regional Water and Sewer Districts: Rights, Powers and Duties.
W74-06981 6E

FLUID MECHANICS
Hydraulics of a Center Pivot System,
W74-06583 3F

On Squire's Theorem in the Study of Hydrodynamic Stability of Plane-Parallel Flows of Incompressible Fluids about Deforming Boundaries,
W74-06911 8B

FLUID MECHANICS

Structure of the Velocity Profile of a Suspension-Bearing Flow,
W74-06912 8B

Degree of Local Saturation of a Flow by Suspended Matter and Its Relation to the Volume Concentration,
W74-06913 8B

The Influence of Clay Fraction on the Basic Parameters of the Hydro-Transport of Fine Free-Flowing Materials,
W74-06914 8B

Distribution of Average Longitudinal Velocities in Flows with Coarse-Grained Materials,
W74-06915 8B

Energy Losses in a Two-Phase Flow Containing Coarse-Grain Material,
W74-06916 8B

FLUORINE

Dynamics of Changes in the Concentration of Fluorine Compounds Emitted by the Phosphorus Fertilizer Manufacturing Establishment in Pozan, and Their Influence on Surface and Underground Waters and on the Atmosphere Within th e Limits of the City of Poznan, (In Polish),
W74-07021 5B

FOLDS (GEOLOGIC)

Folding of Cold Ice,
W74-06928 2C

FOOD CHAINS

Mercury Levels in a Sample of Michigan Residents,
W74-06782 5B

The Role of Food Chains in Environmental Mercury Contamination,
W74-06795 5B

Mercury and Food Chains,
W74-06796 5B

Research Needs: Study of the Environmental Dynamics of Mercury,
W74-06798 5B

Survival and Reproduction of Ring-Necked Pheasants Consuming Two Mercurial Fungicides,
W74-06808 5C

Aquatic Vegetation of the Ottowa River Near Chalk River Nuclear Laboratories (CRNL),
W74-06819 5C

FOOD PROCESSING INDUSTRY

Packinghouse Waste Treatment.
W74-06511 5D

FOODS

Mercury in Humans in the Great Lakes Region,
W74-06783 5B

Mercury Content of Canadian Foods and Cereals Determined by Different Methods,
W74-06787 5A

FORAGES

Processing, Chemical Composition and Nutritive Value of Aquatic Weeds,
W74-06502 4A

FORECASTING

Predicting the Effects of Nutrient Diversion on Lake Recovery,
W74-06576 5C

A Physical Model for Prediction and Control of Saltwater Intrusion in the Floridan Aquifer,
W74-06609 2F

FOREIGN PROJECTS

Bibliography of Water Management.
W74-06854 3F

FOREIGN WATERS

Recent Developments in the Law of the Sea IV: A Synopsis,
W74-06965 6E

FOREST MANAGEMENT

Studies of the Forest Energy Budget,
W74-06518 2D

Automatic Interpretation of ERTS Data for Forest Management,
W74-06643 4A

Precision Annotation of Predetermined Primary Sampling Units on ERTS-1 MSS Images,
W74-06705 4A

FOREST SOILS

Gray Forest Soils in the Spruce-Fir Forests in the Sub-Ural Region (Vyatka-Kama Province), (In Russian),
W74-07004 2G

FORESTED AREAS

Interception Loss in the Humid Forested Areas (With Special Reference to Sungai Lui Catchment, West Malaysia),
W74-07015 2D

FOSSIL FUELS

Sources of Mercury in the Environment,
W74-06771 5B

FRANCE (NEOUVIELLE MASSIF)

Benthic Algae in Water of the Neouvielle Massif (Hautes-Pyrenees),
W74-07013 2H

FRANCE (RHONE DELTA)

First ERTS-1 Results in Southeastern France: Geology, Sedimentology, Pollution at Sea,
W74-06687 4A

FRANCE (RIVIERE DE MORLAIX)

Distribution and Seasonal Variations of the Plankton in 'Riviere de Morlaix,' (In French),
W74-07012 5C

FREMYELLA

An Examination of Three Strains of the Blue-Green Algal Genus, Fremyella,
W74-06759 5C

FRENCH CREEK (PA)

Woodcock Creek Lake, French Creek Basin, Pennsylvania (Final Environmental Impact Statement).
W74-06986 8A

FUEL PROCESSING

The Stack Monitoring System at the Idaho Chemical Processing Plant,
W74-06824 5A

FUNGUS

Competitive Saprophytic Colonization by Fusarium oxysporum F. Sp. vasinfectum,
W74-07011 3F

FURROW IRRIGATION

Evaluation of a Furrow Modifying Device,
W74-06588 3F

FURROW IRRIGATION *IRRIGATION DESIGN

Wheat and Grain Sorghum Irrigation in a Wide Bed-Furrow System,
W74-06580 3F

FUTURE PLANNING (PROJECTED)

U.S. Deepwater Port Study, Vol 2. Commodity Studies and Projections,
W74-06863 6D

U.S. Deepwater Port Study, Vol 3. Physical Coast and Port Characteristics, and Selected Deepwater Port Alternatives,
W74-06864 6D

GALERKIN METHOD

Solution of Equation for Vertical Unsaturated Flow of Soil Water,
W74-06736 2G

GAMBUSIA-AFFINIS

Observations on Gambusia affinis Introduced into Tokushima as a Natural Enemy of Mosquitoes, (In Japanese),
W74-07048 5G

GAME REFUGES

Geography of Waterfowl Resources of the Soviet Union. Condition of Reserves.
W74-06559 6B

GAMMA RADIATION

Aerial Radiological Measuring Survey of the Fort Calhoun Station, Fort Calhoun, Nebraska, August 9-10, 1972.
W74-06815 5A

Aerial Radiological Measuring Survey of the Area Surrounding the Palisades Plant, South Haven, Michigan, July 29, 1970.
W74-06816 5A

GAS CHROMATOGRAPHY

Organic Functional Group Analysis Via Gas Chromatograpy. III. Determination of Carbamates by Reaction with Alkali,
W74-06872 5A

GAS CHROMATROGRAPHY

The Determination of Mono- and Dimethylmercury Compounds by Gas Chromatography,
W74-06792 5A

GAS TRANSFER

Hypolimnion Aeration with Commercial Oxygen - Vol. II - Bubble Plume Gas Transfer,
W74-06526 5D

GEOGRAPHICAL REGIONS

Geography of Waterfowl Resources of the Soviet Union. Condition of Reserves.
W74-06559 6B

GEOLOGIC MAPPING

Pseudocolor Transformation of ERTS Imagery,
W74-06656 7C

Applications of Remote Sensing (ERTS) to Resource Management and Development in Sahelien Africa (Republic of Mali),
W74-06686 4A

A Preliminary Evaluation of ERTS-1 Images on the Volcanic Areas of Southern Italy (NASA Contract FO-013),
W74-06691 7C

Thermal Surveillance of Cascade Range Volcanoes Using ERTS-1 Multispectral Scanner, Aircraft Imaging Systems, and Ground-Based Data Communication Platforms,
W74-06692 7C

Initial Evaluation of the Geologic Applications of ERTS-1 Imagery for New Mexico,
W74-06693 4A

GEOLOGICAL MAPPING
First ERTS-1 Results in Southeastern France: Geology, Sedimentology, Pollution at Sea,
W74-06687 4A

GEOLOGY
Seamounts and Guyots: A Unique Resource,
W74-06966 6E

GEOMORPHOLOGY
New Insights into the Influence of Ice on the Coastal Marine Environment of the Beaufort Sea, Alaska,
W74-06669 2C

Coastal and Submarine Features on MSS Imagery of Southeastern Massachusetts: Comparison with Conventional Maps,
W74-06679 2L

Hydrogeomorphology,
W74-06891 2A

GEORGIA
Utilization of Phosphorus by Phytoplankton in Phosphorus-Rich Environments,
W74-06611 5C

Final Environmental Statement Related to the Proposed Alvin W. Vogtle Nuclear Plant Units 1, 2, 3, and 4.
W74-06821 5B

GEOTHERMAL ENERGY
Geothermal Development and Southwest Storage Basins,
W74-06945 4B

GEOTHERMAL STUDIES
Thermal Surveillance of Cascade Range Volcanoes Using ERTS-1 Multispectral Scanner, Aircraft Imaging Systems, and Ground-Based Data Communication Platforms,
W74-06692 7C

Geothermal Development and Southwest Storage Basins,
W74-06945 4B

GERMANY
Automatic Check and Correction of Meteorological Data in East Germany,
W74-06725 2B

GLACIERS
Snow Cover Surveys in Alaska From ERTS-1 Data,
W74-06697 2C

Recent Activity of Glaciers of Mount Rainier, Washington,
W74-06713 2C

Chemical Profile of the Ross Ice Shelf at Little America V, Antarctica,
W74-06921 2C

Folding of Cold Ice,
W74-06928 2C

GLACIOLOGY
Folding of Cold Ice,
W74-06928 2C

GOLD MINE WASTES
The Impact of Slimes-Dam Formation on Water Quality and Pollution,
W74-06604 5B

GOLDFISH
Interaction of Temperature and Copper Ions as Orienting Stimuli in the Locomotor Behavior of the Goldfish (Carassius auratus),
W74-06769 5C

GOVERNMENTAL INTERRELATIONS
Intergovernmental Relations as seen by Florida State Legislators: Land Use and Water Resource Problems,
W74-06845 6B

Ratification of Proposed Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter (Final Environmental Impact Statement).
W74-06994 6E

GRAIN HARVESTING
Baking Quality of Spring Wheat as Affected by Rain During Drying After Reaping (In Polish),
W74-06548 3F

GRAIN SORGHUM
Wheat and Grain Sorghum Irrigation in a Wide Bed-Furrow System,
W74-06580 3F

GRANTS PASS (OREG)
Availability of Ground Water in the Grants Pass Area, Josephine County, Oregon,
W74-06959 7C

GRASSES
Some Comments on Seagrasses and Sedimentary Processes,
W74-06922 2J

GRAVIMETERIC ANALYSIS
Semimicrodetermination of Mercury(II) and Zinc(II) by Precipitation from Homogeneous Solution, Using Cation Generation Technique,
W74-06869 5A

GREAT LAKES
Mercury in Humans in the Great Lakes Region,
W74-06783 5B

GREENBELTS
Ecological and Physiological Implications of Greenbelt Irrigation,
W74-06608 5D

GROUNDWATER
The Problem of Direct Groundwater Discharge to the Seas,
W74-06881 2F

Procedings Ninth Biennial Conference on Ground Water.
W74-06942 5B

Ground Water Quality Models: What They Can and Cannot Do,
W74-06944 5B

Ground Water Quality Data for Planning, Monitoring and Surveillance,
W74-06947 5A

Sludge Disposal to Land,
W74-06950 5B

The Federal Role and Legislative Trends in Control of Ground Water Quality,
W74-06952 5G

Current State Board Activities in Ground Water Quality Management,
W74-06953 5G

Impact of Water Pollution Control Legislation on Meeting Future Water Needs in California,
W74-06954 5G

Ground Water Pollution--From the Waste Discharger's Viewpoint,
W74-06955 5G

Environmental Quality: As an Objective of Ground Water Management,
W74-06956 5B

Hydrology and Water Resources of the Hoosic River Basin, Massachusetts,
W74-06958 7C

Availability of Ground Water in the Grants Pass Area, Josephine County, Oregon,
W74-06959 7C

Groundwater Use Act of 1969.
W74-06973 6E

GROUNDWATER BASINS
Hydrologic Data from the Piceance Basin, Colorado.
W74-06714 4B

Geothermal Development and Southwest Storage Basins,
W74-06945 4B

GROUNDWATER MOVEMENT
Capillary Properties of Soils - Influence upon Specific Yield,
W74-06584 2F

Unsteady Radial Flow in Partially Saturated Soils,
W74-06587 2G

Upward Flow from Shallow Water Tables,
W74-06844 2F

On the Leakage Assumption Applied to Equations of Groundwater Flow,
W74-06888 2F

On the Solution of Transient Free-Surface Flow Problems in Porous Media by the Finite Element Method,
W74-06890 2F

Conservation Equations for Nonisothermal Flow in Porous Media,
W74-06892 2F

GROUNDWATER RECHARGE
Ground-Water Recharge Strip Basin-Experiments,
W74-06740 4B

Division of Water: Powers and Duties.
W74-06974 6E

GROUNDWATER RESOURCES
Ground-Water Hydrology of Northern Napa Valley, California,
W74-06880 2F

Effects of Ground-Water Development on the Proposed Palmetto Bend Dam and Reservoir in Southeast Texas,
W74-06920 4B

GROWTH COMPARISONS
Growth Comparisons of Oysters, Mussels and Scallops Cultivated on Algae Growth With Artificial Medium and Treated Sewage Effluent,
W74-07035 5C

GROWTH RATES
The Influence of Environmental Factors on the Distribution of Freshwater Algae: An Experimental Study. III. Effects of Temperature, Vitamin Requirements and Inorganic Nitrogen Compounds on Growth,
W74-06549 5C

GROWTH RATES

Growth of Streptococcus cremoris and Streptococcus lactis in a Chemostat. Production of Cells and Survival of Bacteria during Frozen Storage,
W74-06762 5C

Energetics of Daphnia Ambigua,
W74-06831 5C

Biological Response to Detergent and Nondetergent Phosphorus in Sewage - Part II,
W74-06873 5C

GROWTH STAGES
An Examination of Three Strains of the Blue-Green Algal Genus, Fremyella,
W74-06759 5C

GULF OF CALIFORNIA
Oceanographic Mapping of Structure and Dynamics of the Northern Gulf of California by the Use of Spectral Modeling and ERTS-1,
W74-06673 2L

GULF OF MEXICO
Distribution and Movement of Suspended Sediment in the Gulf of Mexico off the Texas Coast,
W74-06672 2L

Remote Sensing of Ocean Currents using ERTS Imagery,
W74-06675 2L

Application of ERTS-1 Imagery to the Harvest Model of the U.S. Menhaden Fishery,
W74-06678 2L

Cooperative Gulf of Mexico Estuarine Inventory and Study, Florida: Phase 1 Area Description,
W74-06995 2L

GUYOTS
Seamounts and Guyots: A Unique Resource,
W74-06966 6E

HAIR
Mercury Concentrations in Human Tissues Among Heavy Fish Eaters,
W74-06812 5B

HALF-LIFE
Behavior of Radioiodine in the Environment and in Man,
W74-06862 5B

HANFORD SITE (WASH)
241-T-106 Tank Leak Investigation.
W74-06861 5B

HARBORS
U.S. Deepwater Port Study, Vol. 2. Commodity Studies and Projections,
W74-06863 6D

U.S. Deepwater Port Study, Vol 3. Physical Coast and Port Characteristics, and Selected Deepwater Port Alternatives,
W74-06864 6D

HAWAII
Legal and Administrative Aspects of an Aquaculture Policy for Hawaii, An Assessment,
W74-06992 6E

HAZARDOUS MATERIALS
A Study of Hazardous Waste Materials, Hazardous Effects and Disposal Methods. Volume I.
W74-06555 5C

HAZARDS
A Study of Hazardous Waste Materials, Hazardous Effects and Disposal Methods. Volume I.
W74-06555 5C

A Study of Hazardous Waste Materials, Hazardous Effects and Disposal Methods. Volume II.
W74-06556 5C

A Study of Hazardous Waste Materials, Hazardous Effects and Disposal Methods. Volume III.
W74-06557 5C

HEAD LOSS
Hydraulics of a Center Pivot System,
W74-06583 3F

HEALTH RESORTS
Effect of Sodium-Potassium Chloride Mineral Water from the Splais Spring (Druskininkai Health Resort) on the Pseudocholinesterase Activity of Blood Serum and Protein-Synthesizing Function of the Liver in Experimental Acute Toxic Hepatitis, (In Russian),
W74-07005 5C

HEAT FLOW
Conservation Equations for Nonisothermal Flow in Porous Media,
W74-06892 2F

HEATED WATER
Use of Waste Heat for Soil Warming in North Carolina,
W74-07000 5D

HEAVY METALS
Distribution of Metals in Baltimore Harbor Sediments,
W74-06924 5B

HELE-SHAW MODEL
A Physical Model for Prediction and Control of Saltwater Intrusion in the Floridan Aquifer,
W74-06609 2F

HELMINTH EGGS
Search for a Method for Sanitizing Sewage from Helminth Eggs Using Agrochemical Means. (Preliminary Communication), (In Russian),
W74-07018 5D

HEPATITIS
Effect of Sodium-Potassium Chloride Mineral Water from the Splais Spring (Druskininkai Health Resort) on the Pseudocholinesterase Activity of Blood Serum and Protein-Synthesizing Function of the Liver in Experimental Acute Toxic Hepatitis, (In Russian),
W74-07005 5C

HIGH WATER MARK
Establishment of Mean High Water Lines in Florida Lakes,
W74-06610 2H

HIGHWAYS
River V. Richmond Metropolitan Authority.
W74-06984 6E

HISTORIC FLOODS
Flood of October 1972 at Petersburg and Colonial Heights, Virginia,
W74-06957 7C

HOGS
Dose-Response Relationships after Exposure of Swine to Organo-Mercurial Compounds,
W74-06809 5C

HOLMES CREEK (FLA)
Choctawhatchee River and Holmes Creek, Florida, Permit Application by Florida Game and Fresh Water Fish Commission (Final Environmental Impact Statement)
W74-06985 4A

HOOSIC RIVER BASIN (MASS)
Hydrology and Water Resources of the Hoosic River Basin, Massachusetts,
W74-06958 7C

HORMOTILA BLENNISTA
Lead Inhibition of Hormotila blennista (Chlorophyceae, Chlorococcales),
W74-06761 5C

HOUSTON (TEX)
A Comparison of Land-Use Determinations Using Data from ERTS-1 and High Altitude Aircraft,
W74-06638 4A

HUMAN BLOOD
The Binding of Inorganic and Organic Mercury Compounds (Hg 203) to Constituents of Normal Human Blood,
W74-06803 5C

HUMAN PATHOLOGY
Surface Electromyography in Chronic Inorganic Mercury Intoxication,
W74-06801 5C

Biotransformation of Organo-Mercurials in Mammals,
W74-06802 5C

The Binding of Inorganic and Organic Mercury Compounds (Hg 203) to Constituents of Normal Human Blood,
W74-06803 5C

Biological Reactions and Pathological Changes in Human Beings and Animals Caused by Organic Mercury Contamination,
W74-06804 5C

The Dose-Response Relationship Resulting from Exposure to Alkyl Mercury Compounds,
W74-06805 5C

The Relationship Between Mercury Concentration in Hair and the Onset of Minamata Disease,
W74-06806 5C

Organic Mercury Poisoning in Alamogordo, New Mexico,
W74-06807 5C

Detection and Appraisal of Subclinical Intoxications,
W74-06810 5C

Approaches to the Detection of Subclinical Mercury Intoxications: Experience in Minamata, Japan,
W74-06811 5C

Biological Effects of Mercury Compounds, Discussion Paper,
W74-06814 5C

HUMAN POPULATION
Epidemiological Approaches to the Study of Subclinical Effects of Mercury Intoxication,
W74-06813 5B

HUNGARY
Computer Monitoring of Precipitation in Hungary,
W74-06726 2B

HUNGARY (LAKE BALATON)
Studies on the Photosynthetic Pigments and Their Decomposition in the Sediment of Lake Balaton and Lake Belso,
W74-06741 5C

Horizontal Phytoplankton Studies in Lake Balaton Based on Scooped Samples and Filtrates Taken in 1967,
W74-06756 5C

HUNGARY (LAKE BELSO)
Studies on the Photosynthetic Pigments and Their Decomposition in the Sediment of Lake Balaton and Lake Belso,
W74-06741 5C

HURRICANE CREEK WATERSHED (TENN)
Hurricane Creek Watershed Project, Humphreys and Dickson Counties, Tennessee (Final Environmental Impact Statement).
W74-06988 4D

HYDRAULIC CONDUCTIVITY
Measurement of Hydraulic Conductivity By Means of Steady, Spherically Symmetric Flows,
W74-06735 2G

A Comparison of Hydraulic Conductivities Calculated with Morphometric and Physical Methods,
W74-06899 2G

Electro-Osmotic Effects in a Bentonite-Water System,
W74-06910 2K

One-Dimensional Vertical Infiltration,
W74-07034 2G

HYDRAULIC MODELS
Effect of Roughness Elements on Hydraulic Resistance for Overland Flow,
W74-06594 8B

Distribution and Mixing of Inflow into Stratified Lakes: A Hydraulic Model Study, (Phase I),
W74-06618 2H

Laboratory Experiments with Surface Runoff,
W74-06737 2E

Ground-Water Recharge Strip Basin-Experiments,
W74-06740 4B

HYDROBIOLOGY
Hydrobiological Studies 3.
W74-06530 5C

HYDRODYNAMICS
On Squire's Theorem in the Study of Hydrodynamic Stability of Plane-Parallel Flows of Incompressible Fluids about Deforming Boundaries,
W74-06911 8B

HYDROECONOMIC ANALYSIS
Application of DDDP in Water Resources Planning,
W74-06503 6A

HYDROGEN ION CONCENTRATION
Buffer Capacity in Aquatic Ecosystems,
W74-06829 5B

Buffer Intensities and Equilibrium pH of Minerals and Soils: 1. The Contribution of Minerals and Aqueous Carbonate to pH Buffering,
W74-06904 2G

Buffer Intensities and Equilibrium pH of Minerals and Soils: II. Theoretical and Actual pH of Minerals and Soils,
W74-06905 2G

HYDROGEOLOGY
Ground-Water Hydrology of Northern Napa Valley, California,
W74-06880 2F

Hydrogeomorphology,
W74-06891 2A

Karst Hydrology--A Review,
W74-06907 2F

Availability of Ground Water in the Grants Pass Area, Josephine County, Oregon,
W74-06959 7C

HYDROGEOMORPHOLOGY
Hydrogeomorphology,
W74-06891 2A

HYDROLOGIC BUDGET
Materials Input of Lake Champlain: A Synoptic Appraisal,
W74-06882 2H

HYDROLOGIC DATA
Hydrologic Data from the Piceance Basin, Colorado.
W74-06714 4B

Machine Control of the Quality of Observations in Automated Hydrometeorological-Data Processing,
W74-06723 2B

Fundamentals of Automatic Control of Meteorological Data,
W74-06724 2B

Automatic Check and Correction of Meteorological Data in East Germany,
W74-06725 2B

Computer Monitoring of Precipitation in Hungary,
W74-06726 2B

Automatic Monitoring of Daily Results of Basic Meteorological Observations,
W74-06727 2B

Automatic Method of Monitoring the Quality of Mean Monthly Meteorological Data,
W74-06728 2B

Automatic Monitoring of Processing of Daily Radiosonde Data on Temperature and Geopotential,
W74-06729 2B

Automatic Monitoring and Processing of Hourly Hydrometeorological Information,
W74-06730 2B

Some Principles of Objective Control of Marine Meteorological Information,
W74-06731 2B

Automatic Processing of Rainfall Data,
W74-06732 2B

An Algorithm for Monitoring Hydrometeorological Information,
W74-06733 2B

HYPOLIMNION
Hypolimnion Aeration with Commercial Oxygen - Vol. I - Dynamics of Bubble Plume,
W74-06525 5D

Hypolimnion Aeration with Commercial Oxygen - Vol. II - Bubble Plume Gas Transfer,
W74-06526 5D

ICE
Snow Cover Surveys in Alaska From ERTS-1 Data,
W74-06697 2C

Analysis of the Concentration of Microparticles in the Long Ice Core from Byrd Station,
W74-06931 2C

ICE COVER
Investigations Performed on the Arctic Ice Dynamics Joint Experiment, March 1971,
W74-06716 2C

Mesoscale Strain Measurements on the Beaufort Sea Pack Ice,
W74-06717 2C

Structure of a Multiyear Pressure Ridge,
W74-06718 2C

Top and Bottom Roughness of a Multiyear Ice Floe,
W74-06719 2C

Airphoto Analysis of Ice Deformation in the Beaufort Sea,
W74-06720 2C

Data on Morphological and Physical Characteristics of Sea Ice in the Beaufort Sea,
W74-06721 2C

ICELAND (CASCADE RANGE)
Thermal Surveillance of Cascade Range Volcanoes Using ERTS-1 Multispectral Scanner, Aircraft Imaging Systems, and Ground-Based Data Communication Platforms,
W74-06692 7C

IDAHO
1972 Operation of the ICPP Rare Gas Recovery Facility,
W74-06822 5D

The Stack Monitoring System at the Idaho Chemical Processing Plant,
W74-06824 5A

ILLINOIS
Network Analysis of Conjunctively Operated Ground Water-Surface Water Systems,
W74-06504 4B

Recovery of Fatty Materials from Edible Oil Refinery Effluents,
W74-06514 5D

Quantitative Methods for Preliminary Design of Water Quality Surveillance Systems,
W74-06885 5A

Nutwood Watershed, Illinois (Final Environmental Statement).
W74-06990 4A

ILLINOIS (LUSK CREEK)
An Annotated List of the Summer Vertebrate Fauna of Upper Lusk Creek, Pope County, Illinois,
W74-07036 2I

IMBIBITION
Unsteady Radial Flow in Partially Saturated Soils,
W74-06587 2G

IMPORT
U.S. Deepwater Port Study, Vol 2. Commodity Studies and Projections,
W74-06863 6D

IN-SEWER TREATMENT
Packinghouse Waste Treatment
W74-06511 5D

INDIA (BURABALANGA)
Ecological Aspects Along the Shores of the Burabalanga Tidal Estuary Balasore District, Orissa State,
W74-07049 2L

INDIANA
Stormwater Runoff Quality for Urban and Semi-Urban/Rural Watersheds,
W74-06851 5B

Quantitative Methods for Preliminary Design of Water Quality Surveillance Systems,
W74-06885 5A

INDUSTRIAL HYGIENE
Dose-Response Relationship Associated with Known Mercury Absorption at Low Dose Levels of Inorganic Mercury,
W74-06800 5C

INDUSTRIAL PLANTS
Dose-Response Relationship Associated with Known Mercury Absorption at Low Dose Levels of Inorganic Mercury,
W74-06800 5C

INDUSTRIAL PRODUCTION
Chlorine Production Drops as Demand Lags.
W74-06766 5B

INDUSTRIAL WASTES
Recovery of Fatty Materials from Edible Oil Refinery Effluents,
W74-06514 5D

Protozoans in Ponds Filled with Sugar Factory Wastes,
W74-06552 5C

Macrobenthos of Ponds with Sugar Factory Wastes,
W74-06553 5C

A Study of Hazardous Waste Materials, Hazardous Effects and Disposal Methods. Volume I.
W74-06555 5C

A Study of Hazardous Waste Materials, Hazardous Effects and Disposal Methods. Volume II.
W74-06556 5C

A Study of Hazardous Waste Materials, Hazardous Effects and Disposal Methods. Volume III.
W74-06557 5C

Chlorine Production Drops as Demand Lags.
W74-06766 5B

Sources of Mercury in the Environment,
W74-06771 5B

The Mercury Pollution Problem in Michigan,
W74-06773 5B

Mercury Levels in Wisconsin Fish,
W74-06778 5B

Investigation of Mercury Contamination in the Tennessee Valley Region,
W74-06780 5B

Distribution of Mercury in the Environment of Minamata Bay and the Inland Ariake Sea,
W74-06781 5B

Efficient Pricing for Urban Waste Water Renovation,
W74-06828 5D

INFILTRATION
Gravity Correction Due to a Variation of Pressure Head Within a Cavity,
W74-06734 2G

Solution of Equation for Vertical Unsaturated Flow of Soil Water,
W74-06736 2G

INFILTRATION RATES
Hydrodynamics of Border Irrigation Advance,
W74-06592 3F

Sensitivity of Surface Runoff to Variations of Watershed Parameters in Small Urban Areas-A Kinematic Model,
W74-06853 4C

INFILTRATION (VERTICAL)
One-Dimensional Vertical Infiltration,
W74-07034 2G

INFORMATION CLEARING-HOUSE
Information Resource: Final Report Water Pollution Control in Water Utilities,
W74-06527 5F

INFORMATION RESOURCE
Information Resource: Final Report Water Pollution Control in Water Utilities,
W74-06527 5F

INHIBITION
Lead Inhibition of Hormotila blennista (Chlorophyceae, Chlorococcales),
W74-06761 5C

INORGANIC COMPOUNDS
The Determination of Ethylmercury in Blood,
W74-06791 5A

INPUT-OUTPUT ANALYSIS
Techniques for Identifying and Evaluating Market and Nonmarket Benefits and Costs of Water Resource Systems.
W74-06852 6B

INSTITUTIONS
The Environmental Impulse and its Competitors: Attitudes, Interests, and Institutions at Lake Tahoe,
W74-06843 6E

INSTRUMENTATION
Analysis of the Feasibility of an Experiment to Measure Carbon Monoxide in the Atmosphere,
W74-06917 5A

INTER-AGENCY COMM
Three-Year Evolution,
W74-06970 6G

INTER-BASIN TRANSFERS
Conjunctive Operation of Southern California Ground Water Basins with the State Water Project,
W74-06943 4B

INTERCEPTION LOSS
Interception Loss in the Humid Forested Areas (With Special Reference to Sungai Lui Catchment, West Malaysia),
W74-07015 2D

INTERFACES (AQUATIC)
Applicability of ERTS-1 Imagery to the Study of Suspended Sediment and Aquatic Fronts
W74-06666 2L

INTERNATIONAL AGREEMENTS
Recent Developments in the Law of the Sea IV. A Synopsis,
W74-06965 6E

INTERNATIONAL LAW
Ratification of Proposed Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter (Final Environmental Impact Statement)
W74-06994 6E

INTERNATIONAL WATERS
Seamounts and Guyots: A Unique Resource.
W74-06966 6E

Ratification of Proposed Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter (Final Environmental Impact Statement).
W74-06994 6E

IODIDES
On the Reaction Between Iodide and Mercury(II),
W74-06870 5A

IODINE
Influence of Iodine on Growth and Development of the Brown Alga Ectocarpus Siliculosus in Axenic Cultures,
W74-06752 5C

Analysis of Iodine in Antarctic Snow,
W74-06929 5B

IODINE RADIOISOTOPES
Behavior of Radioiodine in the Environment and in Man,
W74-06862 5B

ION EXCHANGE
Physical-Chemical Treatment of Raw Municipal Wastewater,
W74-06509 5D

A Simple, Rapid Method for the Determination of Trace Mercury in Fish Via Neutron Activation Analysis,
W74-06788 5A

The Selective Removal of Nitrate and Nitrite from Polluted Water,
W74-06833 5G

Semimicrodetermination of Mercury(II) and Zinc(II) by Precipitation from Homogeneous Solution, Using Cation Generation Technique,
W74-06869 5A

Thermodynamics of Ion Exchange,
W74-06936 2G

Atomic Absorption Detector for Liquid-Liquid Chromatography,
W74-06998 5A

ION-SELECTIVE ELECTRODES
A Universal Ion-Selective Electrode Based on Graphite Paste,
W74-06758 2K

Selectrode - the Universal Ion-Selective Electrode. Part VI. The Calcium (II) Selectrode Employing a New Ion Exchanger in a Nonporous Membrane and a Solid-State Reference System,
W74-06764 5A

Selectrode - the Universal Ion-Selective Electrode. Part VII. A Valinomycin-Based Potassium Electrode with Nonporous Polymer Membrane and Solid-State Inner Reference System,
W74-06765 5A

ION TRANSPORT
Environmental Dynamics of Mercury: Discussion Paper,
W74-06799 5B

IONS
On the Reaction Between Iodide and Mercury(II),
W74-06870 5A

IOWA
Dry and Wet, July-August Rainfall Areas in Iowa,
W74-07045 2B

IRAN
Application of ERTS-1 Imagery in the Fields of Geology, Agriculture, Forestry, and Hydrology to Selected Test Sites in Iran,
W74-06710 4A

IRON
Transformation of Iron in a Waterlogged Soil as Influenced by Redox Potential and pH,
W74-06934 5B

IRON COMPOUNDS
Ionic State and Coordination of Iron in Bog Lakes,
W74-06744 5C

IRRIGATION
Bibliography of Water Management.
W74-06854 3F

IRRIGATION DESIGN
Design Criteria for Irrigation Systems with Complex Pipe Loops,
W74-06585 3F

Hydrodynamics of Border Irrigation Advance,
W74-06592 3F

IRRIGATION ENGINEERING
Design Criteria for Irrigation Systems with Complex Pipe Loops,
W74-06585 3F

IRRIGATION PRACTICES
Wheat and Grain Sorghum Irrigation in a Wide Bed-Furrow System,
W74-06580 3F

Hydrodynamics of Border Irrigation Advance,
W74-06592 3F

Sprinkler Precipitation Gage Errors,
W74-06593 3F

Pasture Irrigation with a Center-Pivot Sprinkler System,
W74-06601 3F

ITALY
A Preliminary Evaluation of ERTS-1 Images on the Volcanic Areas of Southern Italy (NASA Contract FO-013),
W74-06691 7C

ITALY (ISPRA)
Radioecological Researches in Freshwater and Terrestrial Environment, (In Italian),
W74-07009 5B

ITALY (RIVER TARO)
Predation on the Freshwater Bivalve Unio pictorum by the Rat, Rattus norvegicus, (In Italian),
W74-07008 2I

JAPAN
Yamadaphycus, a New Genus of the Delesseriaceae (Rhodophyta),
W74-06753 5A

Approaches to the Detection of Subclinical Mercury Intoxications: Experience in Minamata, Japan,
W74-06811 5C

JAPAN (KYOTO CITY)
An Epidemiological Study on Clonorchiasis in Kyoto City, (In Japanese),

NATURAL RESOURCES
Multidisciplinary Application of ERTS-1 Data to North Carolina Natural Resource Management,
W74-06682 4C

Natural Resource Inventory and Monitoring in Oregon With ERTS Imagery,
W74-06683 4A

NAVIGABLE RIVERS
Choctawhatchee River and Holmes Creek, Florida, Permit Application by Florida Game and Fresh Water Fish Commission (Final Environmental Impact Statement).
W74-06985 4A

NAVIGABLE WATERS
River V. Richmond Metropolitan Authority.
W74-06984 6E

NEBRASKA
Pasture Irrigation with a Center-Pivot Sprinkler System,
W74-06601 3F

Aerial Radiological Measuring Survey of the Fort Calhoun Station, Fort Calhoun, Nebraska, August 9-10, 1972.
W74-06815 5A

Biological Treatment of Feedlot Runoff,
W74-06847 5D

NEOCHLORIS
The Genus Neochloris Starr (Chlorophyceae, Chlorococcales),
W74-06760 5A

NETWORK FLOW ANALYSIS
Network Analysis of Conjunctively Operated Ground Water-Surface Water Systems,
W74-06504 4B

NEUTRALIZATION
An Appraisal of Neutralization Processes to Treat Coal Mine Drainage,
W74-06512 5D

NEUTRON ACTIVATION ANALYSIS
Preparation of Biological Samples for Neutron Activation Analysis of Mercury,
W74-06786 5A

A Simple, Rapid Method for the Determination of Trace Mercury in Fish Via Neutron Activation Analysis,
W74-06788 5A

Determination of Mercury by Non-Destructive Neutron Activation Analysis,
W74-06789 5A

Distribution and Circulation of Arsenic Through Water, Organisms and Sediments of Lake Michigan,
W74-07046 5B

NEVADA (LAKE MEAD)
Phytoplankton Successions and Lake Dynamics in Las Vegas Bay, Lake Mead, Nevada,
W74-07001 5C

NEVADA TEST SITE
(Radiation Data, Section II. Water).
W74-06856 5A

NEVADA TEST STE
Environmental Aspects of Plutonium and Other Elements, a Selected Annotated Bibliography.
W74-06857 5C

NEW JERSEY
Utilization of Trickling Filters for Dual Treatment of Dry and Wet Weather Flows.
W74-06508 5D

Unrecorded Pollution and Dynamics of Biochemical Oxygen Demand,
W74-06613 5B

Distribution of Autotrophic Nitrifying Bacteria in a Polluted Stream,
W74-06834 5C

Water Pollution--Summer Intern Program
W74-06982 6E

NEW MEXICO
Initial Evaluation of the Geologic Applications of ERTS-1 Imagery for New Mexico,
W74-06693 4A

Organic Mercury Poisoning in Alamogordo, New Mexico,
W74-06807 5C

Geologic and Hydrologic Background for Selecting Site of Pilot-Plant Repository for Radioactive Waste,
W74-06820 5B

NEW YORK
A Chart of New York Water Law,
W74-06614 6E

The Runoff of Water and Nutrients from Watersheds Tributary to Cayuga Lake, New York,
W74-06848 5B

Water and Nutrient Budgets for Cayuga Lake, New York,
W74-06849 5B

Materials Input of Lake Champlain: A Synoptic Appraisal,
W74-06882 2H

Drainage.
W74-06983 6E

NEW YORK BIGHT
The Effects of Waste Disposal in the New York Bight. Section 3: Zooplankton Studies.
W74-06866 5C

The Effects of Waste Disposal in the New York Bight. Section 5: Chemical Studies.
W74-06867 5C

The Effects of Waste Disposal in the New York Bight. Sections 7, 8, and 9.
W74-06868 5C

NIGERIA
An Ecological Study of Vellozia schnitzleinia, a Drought-Enduring Plant of Northern Nigeria,
W74-06768 2I

NITRATES
Denitrification as a Pathway for Nitrate Removal in Aquatic Systems,
W74-06612 5B

A Universal Ion-Selective Electrode Based on Graphite Paste,
W74-06758 2K

The Selective Removal of Nitrate and Nitrite from Polluted Water,
W74-06833 5G

New Methods of Nitrite and Nitrate Analysis for Natural Waters,
W74-06836 5A

New Spot Tests for Nitrates and Nitrites,
W74-06878 5A

Mineral Nitrogen Movement into Subsoils Following Continued Annual Fertilization for Corn,
W74-06898 5B

NITRIC OXIDE
Nitric Oxide Sorption by Calcareous Soils: II. Effect of Moisture on Capacity, Rate, and Sorption Products,
W74-06894 5B

NITRIFICATION
Distribution of Autotrophic Nitrifying Bacteria in a Polluted Stream,
W74-06834 5C

NITRIFYING BACTERIA
Distribution of Autotrophic Nitrifying Bacteria in a Polluted Stream,
W74-06834 5C

NITRITES
The Selective Removal of Nitrate and Nitrite from Polluted Water,
W74-06833 5G

New Methods of Nitrite and Nitrate Analysis for Natural Waters,
W74-06836 5A

New Spot Tests for Nitrates and Nitrites,
W74-06878 5A

NITROGEN
Energetics of Daphnia Ambigua,
W74-06831 5C

Ammonia-Nitrogen Removal by Breakpoint Chlorination,
W74-06838 5D

Nitric Oxide Sorption by Calcareous Soils: II. Effect of Moisture on Capacity, Rate, and Sorption Products,
W74-06894 5B

Nitrogen Mineralization-Water Relations in Soils,
W74-06897 5B

NITROGEN FERTILIZER
Effect of Plant Growth and Form of Nitrogen Fertilizer on Dentrification from Four South Australian Soils,
W74-07039 2G

NITROGEN-FIXING ACTIVITY
Nitrogen-Fixing Activity in Upland and Flooded Rice Fields,
W74-07024 5B

NITROGENOUS OXYGEN DEMAND
Distribution of Autotrophic Nitrifying Bacteria in a Polluted Stream,
W74-06834 5C

NON-DESTRUCTIVE TESTS
Determination of Mercury by Non-Destructive Neutron Activation Analysis,
W74-06789 5A

NON-POINT POLLUTION SOURCES
Unrecorded Pollution and Dynamics of Biochemical Oxygen Demand,
W74-06613 5B

NORFOLK (VA)
Land Use Classification and Change Analysis Using ERTS-1 Imagery in Carets,
W74-06625 4A

NORTH CAROLINA
Color Removal from Kraft Mill Effluents by Ultrafiltration,
W74-06521 5D

Inventory of Active Water Resources Research Projects in North Carolina.
W74-06615 9D

Water Resources Research Interests in the Colleges and Universities of North Carolina.
W74-06616 9A

Annual Report, FY 1973.
W74-06617 9A

Multidisciplinary Application of ERTS-1 Data to North Carolina Natural Resource Management,
W74-06682 4C

The Present and Future Status of Eastern North Carolina Wetlands,
W74-06850 2L

Drainage Districts.
W74-06972 6E

Use of Waste Heat for Soil Warming in North Carolina,
W74-07000 5D

NORTH GATE LAKE (MICH
Organic Phosphorus Compounds of a Northern Michigan Bog, Bog-Lake System,
W74-06742 5C

NUCLEAR ENERGY
Whatever Happened to TVA,
W74-06968 6E

NUCLEAR EXPLOSIONS
A Review of Soviet Data on the Peaceful Uses of Nuclear Explosions,
W74-06823 6B

The Challenge of Military Nuclear Construction,
W74-06859 8H

NUCLEAR MOISTURE METERS
Gamma Radiation Measurements of Bulk Density Changes in a Soil Pedon Following Irrigation,
W74-06715 2G

NUCLEAR POWERPLANTS
Aquatic Vegetation of the Ottowa River Near Chalk River Nuclear Laboratories (CRNL),
W74-06819 5C

Final Environmental Statement Related to the Proposed Alvin W. Vogtle Nuclear Plant Units 1, 2, 3, and 4.
W74-06821 5B

A Critical Review of Solid Radioactive Waste Practices at Nuclear Power Plants,
W74-06825 5B

The National Environmental Policy Act and the Licensing Process: Environmentalist Magna Carta or Agency Coup de Grace,
W74-06963 5G

NUCLEAR WASTES
241-T-106 Tank Leak Investigation.
W74-06861 5B

NUMERICAL ANALYSIS
Numerical Model of St. Lawrence River Estuary,
W74-06738 2L

On the Solution of Transient Free-Surface Flow Problems in Porous Media by the Finite Element Method,
W74-06890 2F

NUTRIENT REMOVAL
Basic Research in the Aquatic Environment: Effects of Eutrophication on Phytoplankton Populations and Selected Species of Aquatic Vascular Plants,
W74-06835 5C

NUTRIENTS
Processing, Chemical Composition and Nutritive Value of Aquatic Weeds,
W74-06502 4A

Nitrogen Turnover in Impoundments,
W74-06505 5C

Simulation of Urban Runoff, Nutrient Loading, and Biotic Response of a Shallow Eutrophic Lake,
W74-06564 5C

Multi-Nutrient Dynamic Models of Algal Growth and Species Competition in Eutrophic Lakes,
W74-06568 5C

Capabilities and Limitations of Nutrient-Plankton Model,
W74-06570 5C

Phytoplankton Population Changes and Nutrient Fluctuations in a Simple Aquatic Ecosystem Model,
W74-06571 5C

Predicting the Effects of Nutrient Diversion on Lake Recovery,
W74-06576 5C

The Runoff of Water and Nutrients from Watersheds Tributary to Cayuga Lake, New York,
W74-06848 5B

Water and Nutrient Budgets for Cayuga Lake, New York,
W74-06849 5B

NUTWOOD WATERSHED (ILL)
Nutwood Watershed, Illinois (Final Environmental Statement).
W74-06990 4A

OCCUPATIONAL HEALTH
Surface Electromyography in Chronic Inorganic Mercury Intoxication,
W74-06801 5C

OCEAN CURRENTS
Oceanographic Mapping of Structure and Dynamics of the Northern Gulf of California by the Use of Spectral Modeling and ERTS-1,
W74-06673 2L

Remote Sensing of Ocean Currents using ERTS Imagery,
W74-06675 2L

OCEAN DISPOSAL
Mathematical Model for Barged Ocean Disposal of Wastes,
W74-06837 5B

OCEANOGRAPHY
Oceanographic Mapping of Structure and Dynamics of the Northern Gulf of California by the Use of Spectral Modeling and ERTS-1,
W74-06673 2L

OCEANOGRAPHY

Oceanographic Features in the Lee of the Windward and Leeward Islands: ERTS and Ship Data,
W74-06674 2E

Remote Sensing of Ocean Currents using ERTS Imagery,
W74-06675 2L

Water Depth Estimation with ERTS-1 Imagery,
W74-06680 2L

Calculations of Water Depth From ERTS-MSS Data,
W74-06681 2E

Use of ERTS-1 Pictures in Coastal Oceanography in British Columbia,
W74-06707 2L

Application of ERTS-1 Imagery in Coastal Studies,
W74-06709 2L

ODOR
Contribution to the Investigation of Odours in Water,
W74-06538 5C

OECD
Report of the Expert Group on Detergents.
W74-06554 5C

OHIO
The Effects of Ecological Changes on Buckeye Lake, Ohio, with Emphasis on Largemouth Bass and Aquatic Vascular Plants,
W74-06546 5C

Resource Management Implications of ERTS-1 Data to Ohio,
W74-06684 4A

Mapping of Spoil Banks Using ERTS-1 Pictures,
W74-06695 5A

Division of Water: Powers and Duties.
W74-06974 6E

Powers of the Water Pollution Control Board: Powers of Director of Environmental Protection.
W74-06975 6E

Regional Water and Sewer Districts: Rights, Powers and Duties.
W74-06981 6E

OHIO RIVER
Ohio River Basin Commission Annual Report, Fiscal Year Ending June 30, 1972.
W74-06918 6E

OHIO RIVER BASIN COMMISSION
Ohio River Basin Commission Annual Report, Fiscal Year Ending June 30, 1972.
W74-06918 6E

OIL DISPERSANTS
Effects of Oil Dispersants and Oil Emulsions on Marine Animals,
W74-06745 5C

Using Artemia to Assay Oil Dispersant Toxicities,
W74-06877 5A

OIL EMULSIONS
Effects of Oil Dispersants and Oil Emulsions on Marine Animals,
W74-06745 5C

OIL POLLUTION
Effects of Oil Dispersants and Oil Emulsions on Marine Animals,
W74-06745 5C

OIL SHALES
Hydrologic Data from the Piceance Basin, Colorado.
W74-06714 4B

OIL WASTES
Recovery of Fatty Materials from Edible Oil Refinery Effluents,
W74-06514 5D

OKLAHOMA
Ninth Annual Report of the Oklahoma Water Resources Research Institute, Fiscal Year 1974.
W74-06515 9A

Evaporation from Brine Storage Reservoirs,
W74-06517 2D

OKLAWAHA RIVER (FLA)
Proposal for Oklawaha River, Ocala National Forest, Florida, (Final Environmental Impact Statement).
W74-06993 4A

OPEN CHANNEL FLOW
Effect of Roughness Elements on Hydraulic Resistance for Overland Flow,
W74-06594 8B

OPERATING COSTS
Recovery of Fatty Materials from Edible Oil Refinery Effluents,
W74-06514 5D

Maintenance Management Systems for Municipal Wastewater Facilities,
W74-06579 5D

OPERATION AND MAINTENANCE
Maintenance Management Systems for Municipal Wastewater Facilities,
W74-06579 5D

OPERATIONS
Start-Up of Municipal Wastewater Treatment Facilities,
W74-06578 5D

OPTIMIZATION
Application of DDDP in Water Resources Planning,
W74-06503 6A

Modeling and Optimization of Transient Cooling Water Discharge from Power Generating Plants,
W74-06832 5B

Production Function Theory and the Optimal Design of Waste Treatment Facilities,
W74-06997 6D

OPTIMUM DEVELOPMENT PLANS
Network Analysis of Conjunctively Operated Ground Water-Surface Water Systems,
W74-06504 4B

OREGON
Coliform Bacteria Growth and Control in Aerated Stabilization Basins,
W74-06520 5D

Natural Resource Inventory and Monitoring in Oregon With ERTS Imagery,
W74-06683 4A

Distribution of Mercury in Residual Soils,
W74-06797 5B

Availability of Ground Water in the Grants Pass Area, Josephine County, Oregon,
W74-06959 7C

OREGON (SIXES RIVER)
Social Interaction Between Juvenile Coho (Oncorhynchus kisutch) and Fall Chinook Salmon (O. tshawytscha) in Sixes River, Oregon,
W74-07040 2I

ORGANIC COMPOUNDS
The Determination of Ethylmercury in Blood.
W74-06791 5A

Approaches to the Detection of Subclinical Mercury Intoxications. Experience in Minamata, Japan,
W74-06811 5C

New Methods of Nitrite and Nitrate Analysis for Natural Waters,
W74-06836 5A

ORGANIC MATTER
Oxidation of Organic Matter in Sediments,
W74-06528 5C

Preparation of Biological Samples for Neutron Activation Analysis of Mercury,
W74-06786 5A

ORGANIC WASTES
Buffer Capacity in Aquatic Ecosystems,
W74-06829 5B

ORGANIZATIONS
Inventory of Active Water Resources Research Projects in North Carolina.
W74-06615 9D

ORGANOMERCURIALS
Biotransformation of Organo-Mercurials in Mammals,
W74-06802 5C

The Binding of Inorganic and Organic Mercury Compounds (Hg 203) to Constituents of Normal Human Blood,
W74-06803 5C

Dose-Response Relationships after Exposure of Swine to Organo-Mercurial Compounds,
W74-06809 5C

ORTHO-DIAMINES
New Methods of Nitrite and Nitrate Analysis for Natural Waters,
W74-06836 5A

OTTAWA RIVER (CANADA)
Aquatic Vegetation of the Ottowa River Near Chalk River Nuclear Laboratories (CRNL),
W74-06819 5C

OVERLAND FLOW
Laboratory Experiments with Surface Runoff,
W74-06737 2E

Sensitivity of Surface Runoff to Variations of Watershed Parameters in Small Urban Areas-A Kinematic Model,
W74-06853 4C

OWNERSHIP OF BEDS
The Law to Govern Deepsea Mining Until Superseded by International Agreement,
W74-06964 6E

OXIDATION
An Appraisal of Neutralization Processes to Treat Coal Mine Drainage,
W74-06512 5D

A Design and Economic Evaluation of Catalytic Oxidation of Phenols in Wastewater,
W74-06516 5D

Oxidation of Organic Matter in Sediments,
W74-06528 5C

Oxidation of n-Alkanes by Cladosporium resinae,
W74-06763 5C

OXIDATION LAGOONS
Intermittent Sand Filtration to Upgrade Existing Wastewater Treatment Facilities,
W74-06506 5D

OXYGEN
Sources of Oxygen in Estuaries,
W74-06539 5C

Oxygen in Estuaries: Requirements for Fisheries,
W74-06542 5C

Activated Sludge Treatment Systems with Oxygen,
W74-06839 5D

Correlation Between CO2 and O2 Concentrations in Lake Erie, USA,
W74-07025 5C

OXYGEN ACTIVATED SLUDGE
Activated Sludge Treatment Systems with Oxygen,
W74-06839 5D

OXYGEN CONSUMPTION
Energetics of Daphnia Ambigua,
W74-06831 5C

OXYGEN DEMAND
Oxidation of Organic Matter in Sediments,
W74-06528 5C

Distribution of Autotrophic Nitrifying Bacteria in a Polluted Stream,
W74-06834 5C

OXYGEN DEMAND KINETICS
Unrecorded Pollution and Dynamics of Biochemical Oxygen Demand,
W74-06613 5B

OXYGEN ISOTOPES
Analysis of the Concentration of Microparticles in the Long Ice Core from Byrd Station,
W74-06931 2C

OXYGEN SAG
Oxygen in Estuaries: Requirements for Fisheries,
W74-06542 5C

OXYGEN SOURCES
Sources of Oxygen in Estuaries,
W74-06539 5C

OXYGENATION
Hypolimnion Aeration with Commercial Oxygen - Vol. I - Dynamics of Bubble Plume,
W74-06525 5D

Hypolimnion Aeration with Commercial Oxygen - Vol. II - Bubble Plume Gas Transfer,
W74-06526 5D

OYSTERS
Growth Comparisons of Oysters, Mussels and Scallops Cultivated on Algae Growth With Artificial Medium and Treated Sewage Effluent,
W74-07035 5C

OZONE
Laboratory Ozonation of Muncipal Wastewaters,
W74-06840 5D

PACIFIC OCEAN
Temperature Control of Reproduction and Productivity in a Subarctic Coralline Alga,
W74-06751 5C

PACK ICE
Investigations Performed on the Arctic Ice Dynamics Joint Experiment, March 1971,
W74-06716 2C

Mesoscale Strain Measurements on the Beaufort Sea Pack Ice,
W74-06717 2C

Structure of a Multiyear Pressure Ridge,
W74-06718 2C

Top and Bottom Roughness of a Multiyear Ice Floe,
W74-06719 2C

Airphoto Analysis of Ice Deformation in the Beaufort Sea,
W74-06720 2C

Data on Morphological and Physical Characteristics of Sea Ice in the Beaufort Sea,
W74-06721 2C

PALEOCLIMATOLOGY
Recent Activity of Glaciers of Mount Rainier, Washington,
W74-06713 2C

PALMETTO BEND DAM (TEX)
Effects of Ground-Water Development on the Proposed Palmetto Bend Dam and Reservoir in Southeast Texas,
W74-06920 4B

PASSAIC RIVER (N
Distribution of Autotrophic Nitrifying Bacteria in a Polluted Stream,
W74-06834 5C

PASTURE MANAGEMENT
Pasture Irrigation with a Center-Pivot Sprinkler System,
W74-06601 3F

PASTURES (TROPICAL)
Evaluation of Influence of Available Soil Water Storage Capacity on Growing Season Length and Yield of Tropical Pastures Using Simple Water Balance Models,
W74-06927 3F

PATH OF POLLUTANTS
The Impact of Slimes-Dam Formation on Water Quality and Pollution,
W74-06604 5B

Some Estimates of Natural Levels of Mercury in the Environment,
W74-06772 5B

Mercury in Wild Animals, Lake St. Clair, 1970,
W74-06776 5B

Mercury Levels in Wisconsin Fish,
W74-06778 5B

The Role of Food Chains in Environmental Mercury Contamination,
W74-06795 5B

Mercury and Food Chains,
W74-06796 5B

Distribution of Mercury in Residual Soils,
W74-06797 5B

Research Needs: Study of the Environmental Dynamics of Mercury,
W74-06798 5B

A Radioactive Isotopic Characterization of the Environment Near Wiscasset, Maine: A Preoperational Survey in the Vicinity of the Maine Yankee Atomic Power Plant,
W74-06855 5A

(Radiation Data, Section II. Water).
W74-06856 5A

Azide and Ethylenethiourea Mobility in Soils,
W74-06896 5B

Mineral Nitrogen Movement into Subsoils Following Continued Annual Fertilization for Corn,
W74-06898 5B

Distribution of Metals in Baltimore Harbor Sediments,
W74-06924 5B

Solute Movement Through Disturbed and Undisturbed Soil Cores,
W74-06935 5B

PATHOLOGY
The Effects of Waste Disposal in the New York Bight. Sections 7, 8, and 9.
W74-06868 5C

PATTERSON WATERSHED PROJECT (CALIF)
Patterson Watershed Project, Stanislaus County, California (Final Environmental Impact Statement).
W74-06987 4A

PEACEFUL USES
A Review of Soviet Data on the Peaceful Uses of Nuclear Explosions,
W74-06823 6B

PEARSON LAW
Determination of the Confidence Intervals of the Pearson III Law Using Order Statistics (Determination des intervalles de confiance de la loi Pearson III par les statistiques d'ordre),
W74-06906 2E

PENNSYLVANIA
An Appraisal of Neutralization Processes to Treat Coal Mine Drainage,
W74-06512 5D

Investigations of an Urban Area and its Locale Using ERTS-1 Data Supported by U-Photography,
W74-06635 4A

Mapping of Agricultural Land Use from ERTS-1 Digital Data,
W74-06640 4A

The Use of the Temporal Dimension in Classifying and Mapping ERTS-1 Mss Data,
W74-06641 4A

Identification and Mapping of Coal Refuse Banks and Other Targets in the Anthracite Region,
W74-06642 4A

Woodcock Creek Lake, French Creek Basin, Pennsylvania (Final Environmental Impact Statement).
W74-06986 8A

PERCOLATION
Quality Improvement of Feedlot Lagoon Water by Percolation Through Soil Under Native Pasture,
W74-06830 5D

PERIPHYTON
Epiphytic Microphytes in a Pond Polluted with Beet Sugar Factory Wastes,
W74-06551 5C

PERU (LAGUNA DE VEGUETA)
The Laguna de Vegueta on the Mid-Peruvian Coast and Its Fishes, Particularly Aequidens rivulatus (Guenther 1859), (In German),
W74-07007 2H

PESTICIDE KINETICS
Azide and Ethylenethiourea Mobility in Soils,
W74-06896 5B

PESTICIDES
Electron-Donor-Acceptor Complexing Reagents in the Analysis of Pesticides. VI. Influence of Structure in Detection and Identification,
W74-06871 5A

PHAEOPHYTA
Influence of Iodine on Growth and Development of the Brown Alga Ectocarpus Siliculosus in Axenic Cultures,
W74-06752 5C

PHENOLS
A Design and Economic Evaluation of Catalytic Oxidation of Phenols in Wastewater,
W74-06516 5D

PHOENIX (ARIZ)
Change in Land Use in the Phoenix (1:250,000) Quadrangle, Arizona between 1970 and 1972: Successful Use of a Proposed Land Use Classification System,
W74-06622 4A

PHOSPHATES
Report of the Expert Group on Detergents.
W74-06554 5C

Complexim etric Determination of Phosphate,
W74-06757 5A

Kinetics of the Phosphate Interaction with Calcite,
W74-06895 5B

PHOSPHORIMETRY
Phosphorimetric Determination of Traces of Boron,
W74-06755 5A

PHOSPHORUS
Long-Term Lake Recovery Related to Available Phosphorus,
W74-06562 5C

Some Aspects of Phosphorus Dynamics of the Twin Lakes Watershed,
W74-06565 5C

Activity Analysis and the Management of Resources: A Model for Control of Eutrophication,
W74-06574 5C

Utilization of Phosphorus by Phytoplankton in Phosphorus-Rich Environments,
W74-06611 5C

Preliminary Report of the Role of Sphagnum in the Cycling of Phosphorus in a Bog-Lake System,
W74-06743 5C

Quality Improvement of Feedlot Lagoon Water by Percolation Through Soil Under Native Pasture,
W74-06830 5D

Biological Response to Detergent and Nondetergent Phosphorus in Sewage - Part II,
W74-06873 5C

Dynamics of Changes in the Concentration of Fluorine Compounds Emitted by the Phosphorus Fertilizer Manufacturing Establishment in Pozan, and Their Influence on Surface and Underground Waters and on the Atmosphere Within th e Limits of the City of Poznan, (In Polish),
W74-07021 5B

PHOSPHORUS COMPOUNDS
Organic Phosphorus Compounds of a Northern Michigan Bog, Bog-Lake System,
W74-06742 5C

PHOSPHORUS MANAGEMENT
Activity Analysis and the Management of Resources: A Model for Control of Eutrophication,
W74-06574 5C

PHOTOACTIVATION
Absence of Oxygen-Evolving Capacity in Dark-Grown Chlorella: The Photoactivation of Oxygen-Evolving Centers,
W74-06544 5C

PHOTOGRAPHIC PROCESSING
The Use of Photographic Methods in Contrast Enhancement of ERTS-1 Images,
W74-06704 7C

PHOTOSYNTHETIC OXYGEN
Absence of Oxygen-Evolving Capacity in Dark-Grown Chlorella: The Photoactivation of Oxygen-Evolving Centers,
W74-06544 5C

PHOTOSYNTHETIC PIGMENTS
Studies on the Photosynthetic Pigments and Their Decomposition in the Sediment of Lake Balaton and Lake Belso,
W74-06741 5C

PHYSICAL-CHEMICAL TREATMENT
Physical-Chemical Treatment of Raw Municipal Wastewater,
W74-06509 5D

PHYSICAL PROPERTIES
U.S. Deepwater Port Study, Vol 3. Physical Coast and Port Characteristics, and Selected Deepwater Port Alternatives,
W74-06864 6D

PHYSICOCHEMICAL PROPERTIES
Phytoplankton Population Changes and Nutrient Fluctuations in a Simple Aquatic Ecosystem Model,
W74-06571 5C

PHYSIOLOGICAL ECOLOGY
Studies on the Phytoplankton Ecology of the Trondheimsfjord. I. The Chemical Composition of Phytoplankton Populations,
W74-06545 5C

PHYTOCENOSES
Natural Phytocenoses of the River Littoral in the Lower Reaches of the River Hron,
W74-06550 2I

PHYTOPLANKTON
Phytoplankton Populations in Relation to Different Trophic Levels at Winnipesaukee Lake, New Hampshire, U S A ,
W74-06529 5C

Studies on the Phytoplankton Ecology of the Trondheimsfjord I The Chemical Composition of Phytoplankton Populations,
W74-06545 5C

Phytoplankton Population Changes and Nutrient Fluctuations in a Simple Aquatic Ecosystem Model,
W74-06571 5C

Utilization of Phosphorus by Phytoplankton in Phosphorus-Rich Environments,
W74-06611 5C

Horizontal Phytoplankton Studies in Lake Balaton Based on Scooped Samples and Filtrates Taken in 1967,
W74-06756 5C

Basic Research in the Aquatic Environment: Effects of Eutrophication on Phytoplankton Populations and Selected Species of Aquatic Vascular Plants,
W74-06835 5C

Phytoplankton Successions and Lake Dynamics in Las Vegas Bay, Lake Mead, Nevada,
W74-07001 5C

PICEANCE BASIN (COLO)
Hydrologic Data from the Piceance Basin, Colorado.
W74-06714 4B

PIPE FLOW
Hydraulics of a Center Pivot System,
W74-06583 3F

Design Criteria for Irrigation Systems with Complex Pipe Loops,
W74-06585 3F

PLANKTON
The Effect of Mineral Fertilization and of Carp Fry on the Composition and Dynamics of Plankton,
W74-06535 5C

Capabilities and Limitations of Nutrient-Plankton Model,
W74-06570 5C

Biomass in the Upwelling Areas Along the Northwest Coast of Africa as Viewed with ERTS-1,
W74-06677 5A

Mercury in the Lake Michigan Environment,
W74-06779 5B

Distribution and Seasonal Variations of the Plankton in 'Riviere de Morlaix,' (In French),
W74-07012 5C

PLANNING
Application of DDDP in Water Resources Planning,
W74-06503 6A

Emergency Planning for Municipal Wastewater Treatment Facilities,
W74-06577 5D

Area Financing of Water Resource Development in West Minnesota,
W74-06846 6B

Ohio River Basin Commission Annual Report, Fiscal Year Ending June 30, 1972.
W74-06918 6E

A Simulation Approach to Recreation Planning (A Case of Changing Quality),
W74-06996 6B

Production Function Theory and the Optimal Design of Waste Treatment Facilities,
W74-06997 6D

PLANT GROWTH
Modeling Algal Growth Dynamics in Shagawa Lake, Minnesota, with Comments Concerning Projected Restoration of the Lake,
W74-06563 5C

Multi-Nutrient Dynamic Models of Algal Growth and Species Competition in Eutrophic Lakes,
W74-06568 5C

A Simulated Environmental Model of Temperature, Evaporation, Rainfall, and Soil Moisture,
W74-06591 3F

Influence of Iodine on Growth and Development of the Brown Alga Ectocarpus Siliculosus in Axenic Cultures,
W74-06752 5C

Lead Inhibition of Hormotila blennista (Chlorophyceae, Chlorococcales),
W74-06761 5C

Biological Response to Detergent and Nondetergent Phosphorus in Sewage - Part II,
W74-06873 5C

Effect of Plant Growth and Form of Nitrogen Fertilizer on Dentrification from Four South Australian Soils,
W74-07039 2G

PLANT MORPHOLOGY
Absence of Oxygen-Evolving Capacity in Dark-Grown Chlorella: The Photoactivation of Oxygen-Evolving Centers,
W74-06544 5C

An Examination of Three Strains of the Blue-Green Algal Genus, Fremyella,
W74-06759 5C

PLANT PHYSIOLOGY
Endogenous and Photoperiodic Diurnal Rhythms of in Vivo Light Absorption and Scattering in the Green Alga Ulva Lactuca L.,
W74-06547 5C

PLASTIC DEFORMATION
Comparison of Strength Test Methods for Corrugated Plastic Drainage Tubing,
W74-06602 8A

PLASTIC PIPES
Hydraulic Roughness of Corrugated Plastic Tubing,
W74-06589 8B

Comparison of Strength Test Methods for Corrugated Plastic Drainage Tubing,
W74-06602 8A

PLAYAS
In Situ Spectroradiometric Quantification of ERTS Data,
W74-06663 2G

PLOWING
Evaluation of a Furrow Modifying Device,
W74-06588 3F

PLUTONIUM
Environmental Aspects of Plutonium and Other Elements, a Selected Annotated Bibliography.
W74-06857 5C

POECILIID FISH
Observations on Gambusia affinis Introduced into Tokushima as a Natural Enemy of Mosquitoes, (In Japanese),
W74-07048 5G

POISONING
Dose-Response Relationships after Exposure of Swine to Organo-Mercurial Compounds,
W74-06809 5C

POISONS
Organic Mercury Poisoning in Alamogordo, New Mexico,
W74-06807 5C

POLAND
Baking Quality of Spring Wheat as Affected by Rain During Drying After Reaping (In Polish),
W74-06548 3F

Water Pollution and Biology, (In Polish),
W74-07020 5B

POLAND (CZARNA PRZEMSZA-PRZEMSZA RIVERS)
Influence of Some Hydrological Parameters on Changes in the Radioactivity of the Waters of the Rivers Czarna Przemsza and Przemsza,
W74-07019 5B

POLAND (POZNAN)
Dynamics of Changes in the Concentration of Fluorine Compounds Emitted by the Phosphorus Fertilizer Manufacturing Establishment in Pozan, and Their Influence on Surface and Underground Waters and on the Atmosphere Within th e Limits of the City of Poznan, (In Polish),
W74-07021 5B

POLITICAL ASPECTS
Intergovernmental Relations as seen by Florida State Legislators: Land Use and Water Resource Problems,
W74-06845 6B

POLITICAL CONSTRAINTS
The Environmental Impulse and its Competitors: Attitudes, Interests, and Institutions at Lake Tahoe,
W74-06843 6E

POLLUTANT IDENTIFICATION
Biomass in the Upwelling Areas Along the Northwest Coast of Africa as Viewed with ERTS-1,
W74-06677 5A

First ERTS-1 Results in Southeastern France: Geology, Sedimentology, Pollution at Sea,
W74-06687 4A

Use of ERTS-1 Pictures in Coastal Oceanography in British Columbia,
W74-06707 2L

Application of ERTS-1 Imagery in Coastal Studies,
W74-06709 2L

Detection of Turbidity Dynamics in Tampa Bay, Florida Using Multispectral Imagery from ERTS-1,
W74-06711 2L

Complexiметric Determination of Phosphate,
W74-06757 5A

Methods of Analysis for Mercury and its Compounds: A Review,
W74-06785 5A

Preparation of Biological Samples for Neutron Activation Analysis of Mercury,
W74-06786 5A

Mercury Content of Canadian Foods and Cereals Determined by Different Methods,
W74-06787 5A

A Simple, Rapid Method for the Determination of Trace Mercury in Fish Via Neutron Activation Analysis,
W74-06788 5A

Determination of Mercury by Non-Destructive Neutron Activation Analysis,
W74-06789 5A

Determination of Mercury in Biological Tissues,
W74-06790 5A

The Determination of Mono- and Dimethylmercury Compounds by Gas Chromatography,
W74-06792 5A

Analytical Methodology for Mercury-Discussion Paper,
W74-06793 5A

New Methods of Nitrite and Nitrate Analysis for Natural Waters,
W74-06836 5A

Evaluation of a Microwave-Induced Plasma Spectrometer for Trace Analysis,
W74-06841 5A

Semimicrodetermination of Mercury(II) and Zinc(II) by Precipitation from Homogeneous Solution, Using Cation Generation Technique,
W74-06869 5A

Electron-Donor-Acceptor Complexing Reagents in the Analysis of Pesticides. VI. Influence of Structure in Detection and Identification,
W74-06871 5A

Organic Functional Group Analysis Via Gas Chromatograpy. III. Determination of Carbamates by Reaction with Alkali,
W74-06872 5A

Method of Preparing Washed Suspensions of Anaerobic Bacteria for Metabolic Studies,
W74-06875 5A

New Spot Tests for Nitrates and Nitrites,
W74-06878 5A

PB-210 Concentration in Ice Measured at South Pole Station,
W74-06932 5A

Atomic Absorption Detector for Liquid-Liquid Chromatography,
W74-06998 5A

An Atomic Absorption Analysis Method for Cyanide,
W74-06999 5A

Investigation of Brewing Water Treatment,
W74-07023 5A

POLLUTION ABATEMENT
Co-operation for Water Protection: Eutrophication Control,
W74-06543 5C

Basic Research in the Aquatic Environment: Effects of Eutrophication on Phytoplankton Populations and Selected Species of Aquatic Vascular Plants,
W74-06835 5C

Water Pollution--Summer Intern Program.
W74-06982 6E

POLLUTOGRAPHS
Stormwater Runoff Quality for Urban and Semi-Urban/Rural Watersheds,
W74-06851 5B

POLYCARPIC PLANTS
Changes in Rate and Rhythms of Development of Perennial Polycarpic Plants at Different Altitudes in Humid High Mountains, (In Russian),
W74-07014 2I

PONDS
The Effect of Mineral Fertilization and of Carp Fry on the Composition and Dynamics of Plankton,
W74-06535 5C

Macrobenthos of Ponds with Sugar Factory Wastes,
W74-06553 5C

POPULATION
Geography of Waterfowl Resources of the Soviet Union. Condition of Reserves.
W74-06559 6B

POROUS MEDIA
Capillary Properties of Soils - Influence upon Specific Yield,
W74-06584 2F

Conservation Equations for Nonisothermal Flow in Porous Media,
W74-06892 2F

POTABLE WATER
Dynamics of Changes in the Concentration of Fluorine Compounds Emitted by the Phosphorus Fertilizer Manufacturing Establishment in Pozan, and Their Influence on Surface and Underground Waters and on the Atmosphere Within th e Limits of the City of Poznan, (In Polish),
W74-07021 5B

POTASSIUM
Selectrode - the Universal Ion-Selective Electrode. Part VII. A Valinomycin-Based Potassium Electrode with Nonporous Polymer Membrane and Solid-State Inner Reference System,
W74-06765 5A

POTEMOGETON NODOSUS
Nitrogen Turnover in Impoundments,
W74-06505 5C

PRE-IMPOUNDMENT
Effects of Ground-Water Development on the Proposed Palmetto Bend Dam and Reservoir in Southeast Texas,
W74-06920 4B

PRECIPITATION (ATMOSPHERIC)
Analysis of Iodine in Antarctic Snow,
W74-06929 5B

Silver Concentrations in Antarctic Snow and Firn,
W74-06930 5A

University of Chicago Contribution to Project Metromex-I.
W74-06937 2B

Radar Studies of Urban Precipitation Anomaly.
W74-06938 2B

Observations of the Cloud Nucleus Concentration Around the St. Louis Urban Complex,
W74-06939 2B

Upwind and Downwind Cloud-Base Microstructure,
W74-06940 2B

Metromex Temperature and Aerosol Data Reduction: Analysis of the Urban Anomaly,
W74-06941 2B

Estimates of Prairie Provincial Wheat Yields Based on Precipitation and Potential Evapotranspiration,
W74-07027 3F

PRECIPITATION GAGES
Sprinkler Precipitation Gage Errors,
W74-06593 3F

PREDATION
Predation on the Freshwater Bivalve Unio pictorum by the Rat, Rattus norvegicus, (In Italian),
W74-07008 2I

Effects of Alewives (Alosa pseudoharengus) on the Zooplankton of Lake Wononskopomus, Connecticut,
W74-07033 2H

Observations on Comparative Propensities for Carp Fry Destruction by Adults and Last Instar Preimaginal Stages of Predatory Aquatic Insects,
W74-07044 2I

PRESSURE HEAD
Gravity Correction Due to a Variation of Pressure Head Within a Cavity,
W74-06734 2G

PRESSURIZED WATER REACTORS
Final Environmental Statement Related to the Proposed Alvin W. Vogtle Nuclear Plant Units 1, 2, 3, and 4.
W74-06821 5B

PRIMARY PRODUCTION
Systems Analysis in the Marion Lake IBP Project,
W74-07010 5C

PRIMARY PRODUCTIVITY
Micro-Ecosystems Simulation of Primary Production in Thermal and Acid Mine Water Loadings Related to Water Use of the Monongahela River,
W74-06507 5C

The Effect of Mineral Fertilization and of Carp Fry on the Composition and Dynamics of Plankton,
W74-06535 5C

Temperature Control of Reproduction and Productivity in a Subarctic Coralline Alga,
W74-06751 5C

PROBABILITY
Determination of the Confidence Intervals of the Pearson III Law Using Order Statistics (Determination des intervalles de confiance de la loi Pearson III par les statistiques d'ordre),
W74-06906 2E

On Flood Probabilities of East Alpine Rivers
W74-06909 2E

PROCESS CONTROL
Digital Control Algorithms Part III Tuning PI and PID Controllers,
W74-06750 7C

PRODUCTION FUNCTIONS
Production Function Theory and the Optimal Design of Waste Treatment Facilities,
W74-06997 6D

PRODUCTIVITY
Productivity Investigations of Interconnected Marl Lakes (I) The Eight Lakes of the Oliver and Walters Chains, Northeastern Indiana,
W74-06533 5C

Biomass in the Upwelling Areas Along the Northwest Coast of Africa as Viewed with ERTS-1,
W74-06677 5A

Production and Biogenic Activity of Distillates, Filtrates and Extracts from the Pomorie and Atanasovo Lagoon Mud, (In Bulgarian),
W74-07003 2H

PROGRAMS
Water Pollution--Summer Intern Program.
W74-06982 6E

PROJECT PLANNING
Application of DDDP in Water Resources Planning,
W74-06503 6A

PROJECTILES
Quasi-Continuous Explosive Concepts for Hard Rock Excavations,
W74-06860 8H

PROJECTIONS
A Simulation Approach to Recreation Planning (A Case of Changing Quality),
W74-06996 6B

PROJECTS
Inventory of Active Water Resources Research Projects in North Carolina.
W74-06615 9D

PROTECTION
Geography of Waterfowl Resources of the Soviet Union. Condition of Reserves.
W74-06559 6B

PROTEINS
The Binding of Inorganic and Organic Mercury Compounds (Hg 203) to Constituents of Normal Human Blood,
W74-06803 5C

PROTOTYPES
A Physical Model for Simulation of Aquatic Ecosystems,
W74-06573 5C

PROTOZOA
Protozoans in Ponds Filled with Sugar Factory Wastes,
W74-06552 5C

PROVENANCE
Chemical Profile of the Ross Ice Shelf at Little America V, Antarctica,
W74-06921 2C

PUBLIC BENEFITS
A Review of Soviet Data on the Peaceful Uses of Nuclear Explosions,
W74-06823 6B

PUBLIC FINANCING POTENTIALS
Area Financing of Water Resource Development in West Minnesota,
W74-06846 6B

PUBLIC HEALTH
Environmental Mercury Contamination.
W74-06770 5B

Mercury Levels in a Sample of Michigan Residents,
W74-06782 5B

Mercury in Humans in the Great Lakes Region,
W74-06783 5B

Dose-Response Relationship Associated with Known Mercury Absorption at Low Dose Levels of Inorganic Mercury,
W74-06800 5C

Biological Reactions and Pathological Changes in Human Beings and Animals Caused by Organic Mercury Contamination,
W74-06804 5C

Mercury Concentrations in Human Tissues Among Heavy Fish Eaters,
W74-06812 5B

Protecting Ground Water Quality--Some Problems and Solutions,
W74-06946 5B

Urbanization and Human Health,
W74-07017 5G

PULP WASTES
Treatment of Domestic Wastewater and NSSC Pulp and Paper Mill Wastes,
W74-06513 5D

Coliform Bacteria Growth and Control in Aerated Stabilization Basins,
W74-06520 5D

Color Removal from Kraft Mill Effluents by Ultrafiltration,
W74-06521 5D

PUMPS (SYRINGE)
A Multichannel Syringe Pump for Steady State Flow in Soil Columns,
W74-07028 2G

QUALITY CONTROL
Machine Control of the Quality of Observations in Automated Hydrometeorological-Data Processing,
W74-06723 2B

Fundamentals of Automatic Control of Meteorological Data,
W74-06724 2B

Automatic Check and Correction of Meteorological Data in East Germany,
W74-06725 2B

Computer Monitoring of Precipitation in Hungary,
W74-06726 2B

Automatic Monitoring of Daily Results of Basic Meteorological Observations,
W74-06727 2B

Automatic Method of Monitoring the Quality of Mean Monthly Meteorological Data,
W74-06728 2B

Automatic Monitoring of Processing of Daily Radiosonde Data on Temperature and Geopotential,
W74-06729 2B

Automatic Monitoring and Processing of Hourly Hydrometeorological Information,
W74-06730 2B

Some Principles of Objective Control of Marine Meteorological Information,
W74-06731 2B

Automatic Processing of Rainfall Data,
W74-06732 2B

An Algorithm for Monitoring Hydrometeorological Information,
W74-06733 2B

RADIANCE (ATMOSPHERIC)
Computed Atmospheric Effects on ERTS Observations,
W74-06694 2B

RADIATION
DCP-Collected Absolute Target Reflectance Signatures Assist Accurate Interpretation of ERTS-1 Imagery,
W74-06688 7C

RADIOACTIVE WASTE DISPOSAL
Geologic and Hydrologic Background for Selecting Site of Pilot-Plant Repository for Radioactive Waste,
W74-06820 5B

On the Selection of a Ground Disposal Site by Sensitivity Analysis,
W74-06858 5B

RADIOACTIVITY
Aerial Radiological Measuring Survey of the Fort Calhoun Station, Fort Calhoun, Nebraska, August 9-10, 1972.
W74-06815 5A

Aerial Radiological Measuring Survey of the Area Surrounding the Palisades Plant, South Haven, Michigan, July 29, 1970.
W74-06816 5A

Aerial Radiological Measuring Survey of the Area Surrounding the Enrico Fermi Atomic Power Plant, Monroe, Michigan, September 1970.
W74-06817 5A

The EXREM III Computer Code for Estimating External Radiation Doses to Populations from Environmental Releases,
W74-06818 5B

1972 Operation of the ICPP Rare Gas Recovery Facility,
W74-06822 5D

A Critical Review of Solid Radioactive Waste Practices at Nuclear Power Plants,
W74-06825 5B

A Radioactive Isotopic Characterization of the Environment Near Wiscasset, Maine: A Preoperational Survey in the Vicinity of the Maine Yankee Atomic Power Plant,
W74-06855 5A

(Radiation Data, Section II. Water).
W74-06856 5A

The Challenge of Military Nuclear Construction,
W74-06859 8H

Influence of Some Hydrological Parameters on Changes in the Radioactivity of the Waters of the Rivers Czarna Przemsza and Przemsza,
W74-07019 5B

RADIOACTIVITY EFFECTS
Aquatic Vegetation of the Ottowa River Near Chalk River Nuclear Laboratories (CRNL),
W74-06819 5C

RADIOCHEMICAL ANALYSIS
The Binding of Inorganic and Organic Mercury Compounds (Hg 203) to Constituents of Normal Human Blood,
W74-06803 5C

RADIOECOLOGY
Radioecological Researches in Freshwater and Terrestrial Environment, (In Italian),
W74-07009 5B

RADIOISOTOPES
Uptake of Natural Radioisotopes by Aquatic Organisms,
W74-06534 5C

Mercury as a Hydrospheric Pollutant II. Biological Half-Time of Methyl Mercury in Four Mediterranean Species: A Fish, a Crab, and Two Molluscs,
W74-06767 5C

On the Selection of a Ground Disposal Site by Sensitivity Analysis,
W74-06858 5B

Behavior of Radioiodine in the Environment and in Man,
W74-06862 5B

Estimating Soil Erosion from the Redistribution of Fallout Cs-137,
W74-06901 2J

RADIOSONDES
Automatic Monitoring of Processing of Daily Radiosonde Data on Temperature and Geopotential,
W74-06729 2B

RAINFALL
Automatic Processing of Rainfall Data,
W74-06732 2B

Dry and Wet, July-August Rainfall Areas in Iowa,
W74-07045 2B

RAINFALL DURATION
Sensitivity of Surface Runoff to Variations of Watershed Parameters in Small Urban Areas-A Kinematic Model,
W74-06853 4C

RAINFALL-RUNOFF RELATIONSHIPS
Laboratory Experiments with Surface Runoff,
W74-06737 2E

Assessing Systematic Errors in Rainfall-Runoff Models,
W74-06893 2A

RARE GAS RECOVERY
1972 Operation of the ICPP Rare Gas Recovery Facility,
W74-06822 5D

RECIRCULATED WATER
Ecological and Physiological Implications of Greenbelt Irrigation,
W74-06608 5D

RECLAIMED WATER
Effects of Sewage Disposal and Reclamation on Ground Water Quality,
W74-06948 5D

RECLAMATION
Long-Term Lake Recovery Related to Available Phosphorus,
W74-06562 5C

RECREATION
A Simulation Approach to Recreation Planning (A Case of Changing Quality),
W74-06996 6B

RECREATION FACILITIES
Demonstration of a Non-Aqueous Sewage Disposal System,
W74-06519 5D

RECYCLING
1972 Operation of the ICPP Rare Gas Recovery Facility,
W74-06822 5D

REGIONAL ANALYSIS
Modeling and Optimization of Transient Cooling Water Discharge from Power Generating Plants,
W74-06832 5B

Techniques for Identifying and Evaluating Market and Nonmarket Benefits and Costs of Water Resource Systems.

Initial Evaluation of the Geologic Applications of ERTS-1 Imagery for New Mexico,
W74-06693 4A

Computed Atmospheric Effects on ERTS Observations,
W74-06694 2B

Mapping of Spoil Banks Using ERTS-1 Pictures,
W74-06695 5A

Air Quality Indices from ERTS-1 MSS Information, PR 568,
W74-06696 5A

Snow Cover Surveys in Alaska From ERTS-1 Data,
W74-06697 2C

Utilization of ERTS-1 Data to Monitor and Classify Eutrophication of Inland Lakes,
W74-06698 5A

ERTS-1 Observes Algal Bloom in Lake Erie and Utah Lake,
W74-06699 5A

Use of ERTS-1 Data for Regional Planning in the Metropolitan Washington Council of Governments--A Short Brief,
W74-06700 4A

Land Use Mapping and Change Detection Using ERTS Imagery in Montgomery County, Alabama,
W74-06701 4A

Determination of Land Use in Minnesota by Automatic Interpretation of ERTS MSS Data,
W74-06702 4A

Digital Data Processing of ERTS-1 Imagery of Delaware Bay,
W74-06703 2L

The Use of Photographic Methods in Contrast Enhancement of ERTS-1 Images,
W74-06704 7C

Precision Annotation of Predetermined Primary Sampling Units on ERTS-1 MSS Images,
W74-06705 4A

Unsupervised Classification and Areal Measurement of Land and Water Coastal Features on the Texas Coast,
W74-06706 2L

Use of ERTS-1 Pictures in Coastal Oceanography in British Columbia,
W74-06707 2L

Relationships Between Remotely Sensed Fisheries Distribution Information and Selected Oceanographic Parameters in the Mississippi Sound,
W74-06708 7B

Application of ERTS-1 Imagery in Coastal Studies,
W74-06709 2L

Application of ERTS-1 Imagery in the Fields of Geology, Agriculture, Forestry, and Hydrology to Selected Test Sites in Iran,
W74-06710 4A

Detection of Turbidity Dynamics in Tampa Bay, Florida Using Multispectral Imagery from ERTS-1,
W74-06711 2L

Advanced Scanners and Imaging Systems for Earth Observations.
W74-06712 7B

Aerial Radiological Measuring Survey of the Fort Calhoun Station, Fort Calhoun, Nebraska, August 9-10, 1972.
W74-06815 5A

Aerial Radiological Measuring Survey of the Area Surrounding the Palisades Plant, South Haven, Michigan, July 29, 1970.
W74-06816 5A

Aerial Radiological Measuring Survey of the Area Surrounding the Enrico Fermi Atomic Power Plant, Monroe, Michigan, September 1970.
W74-06817 5A

Radar Studies of Urban Precipitation Anomaly,
W74-06938 2B

REPRODUCTION

Survival and Reproduction of Ring-Necked Pheasants Consuming Two Mercurial Fungicides,
W74-06808 5C

RESEARCH

Radioecological Researches in Freshwater and Terrestrial Environment, (In Italian),
W74-07009 5B

RESEARCH AND DEVELOPMENT

Inventory of Active Water Resources Research Projects in North Carolina.
W74-06615 9D

Annual Report, FY 1973.
W74-06617 9A

An Expanding Role for Subarctic Watershed Research,
W74-06884 4D

Legal Impediments to the Use of Interstate Agreements in Coordinated Fisheries Management Programs: States in the N.M.F.S. Southeast Region,
W74-06991 6E

RESEARCH INTERESTS (EDUCATION)
Water Resources Research Interests in the Colleges and Universities of North Carolina.
W74-06616 9A

RESEARCH PRIORITIES
Research Needs: Study of the Environmental Dynamics of Mercury,
W74-06798 5B

RESERVOIR CONSTRUCTION
Woodcock Creek Lake, French Creek Basin, Pennsylvania (Final Environmental Impact Statement).
W74-06986 8A

RESERVOIR EVAPORATION
Evaporation Suppression, A Bibliography.
W74-06501 3D

RESERVOIR SEDIMENTATION
Reservoir Sedimentation,
W74-06883 2J

RESERVOIR SILTING
Reservoir Sedimentation,
W74-06883 2J

RESERVOIR STORAGE
Evaporation from Brine Storage Reservoirs,
W74-06517 2D

RESERVOIRS
Hydrobiological Studies 3.
W74-06530 5C

Survey of Reservoirs in Bohemia and Their Water Quality,
W74-06537 5C

Contribution to the Investigation of Odours in Water,
W74-06538 5C

The Effects of Ecological Changes on Buckeye Lake, Ohio, with Emphasis on Largemouth Bass and Aquatic Vascular Plants,
W74-06546 5C

Effects of Ground-Water Development on the Proposed Palmetto Bend Dam and Reservoir in Southeast Texas,
W74-06920 4B

Proposal for Oklawaha River, Ocala National Forest, Florida, (Final Environmental Impact Statement).
W74-06993 4A

RESIDUAL SOILS
Distribution of Mercury in Residual Soils,
W74-06797 5B

RESINS
The Selective Removal of Nitrate and Nitrite from Polluted Water,
W74-06833 5G

RESOURCE ALLOCATION
The Law to Govern Deepsea Mining Until Superseded by International Agreement,
W74-06964 6E

RESOURCE DEVELOPMENT
The Law to Govern Deepsea Mining Until Superseded by International Agreement,
W74-06964 6E

RESOURCE MANAGEMENT
Resource Management Implications of ERTS-1 Data to Ohio,
W74-06684 4A

RETURN FLOW
Ecological and Physiological Implications of Greenbelt Irrigation,
W74-06608 5D

REVIEWS
Chemical Aspects of Bioassay Techniques for Establishing Water Quality Criteria,
W74-06747 5A

Cyanophages - Viruses Attacking Blue-Green Algae,
W74-06754 5C

Methods of Analysis for Mercury and its Compounds: A Review,
W74-06785 5A

Environmental Dynamics of Mercury: Discussion Paper,
W74-06799 5B

A Review of Soviet Data on the Peaceful Uses of Nuclear Explosions,
W74-06823 6B

A Critical Review of Solid Radioactive Waste Practices at Nuclear Power Plants,
W74-06825 5B

The Problem of Direct Groundwater Discharge to the Seas,
W74-06881 2F

Hydrogeomorphology,
W74-06891 2A

Karst Hydrology--A Review,
W74-06907 2F

REYNOLDS NUMBER
Hydraulic Roughness of Corrugated Plastic Tubing,
W74-06589 8B

RHODE ISLAND
Water Supply Management Alternatives for Rhode Island,
W74-06827 6D

RHODOPHYTA
Yamadaphycus, a New Genus of the Delesseriaceae (Rhodophyta),
W74-06753 5A

RICE FIELDS
Nitrogen-Fixing Activity in Upland and Flooded Rice Fields,
W74-07024 5B

Control of Mosquitoes Breeding in Rice-Fields,
W74-07041 5G

RICHMOND (VA)
River V. Richmond Metropolitan Authority.
W74-06984 6E

RIPARIAN RIGHTS
A Chart of New York Water Law,
W74-06614 6E

RIVER BASIN COMMISSIONS
Ohio River Basin Commission Annual Report, Fiscal Year Ending June 30, 1972.
W74-06918 6E

RIVERS AND HARBORS ACT
River V. Richmond Metropolitan Authority.
W74-06984 6E

RIVERS AND HARBORS ACTS
Conservationists Go to Court- Part I.
W74-06971 4D

ROCK EXCAVATION
Quasi-Continuous Explosive Concepts for Hard Rock Excavations,
W74-06860 8H

ROCK MECHANICS
Geologic and Hydrologic Background for Selecting Site of Pilot Plant Repository for Radioactive Waste,
W74-06820 5B

Quasi-Continuous Explosive Concepts for Hard Rock Excavations,
W74-06860 8H

RODENTS
Predation on the Freshwater Bivalve Unio pictorum by the Rat, Rattus norvegicus, (In Italian),
W74-07008 2I

ROOTED AQUATIC PLANTS
Processing, Chemical Composition and Nutritive Value of Aquatic Weeds,
W74-06502 4A

ROSS ICE SHELF (ANTARCTICA)
Chemical Profile of the Ross Ice Shelf at Little America V, Antarctica,
W74-06921 2C

ROUGHNESS (HYDRAULIC)
Hydraulic Roughness of Corrugated Plastic Tubing,
W74-06589 8B

Effect of Roughness Elements on Hydraulic Resistance for Overland Flow,
W74-06594 8B

Sensitivity of Surface Runoff to Variations of Watershed Parameters in Small Urban Areas-A Kinematic Model,
W74-06853 4C

RUNOFF
Changes in Water Yield of Small Watersheds by Agricultural Practices,
W74-06597 2E

The Runoff of Water and Nutrients from Watersheds Tributary to Cayuga Lake, New York,
W74-06848 5B

RURAL WATERSHEDS
Stormwater Runoff Quality for Urban and Semi-Urban/Rural Watersheds,
W74-06851 5B

SAFETY FACTORS
The Challenge of Military Nuclear Construction,
W74-06859 8H

SALINE WATER INTRUSION
A Physical Model for Prediction and Control of Saltwater Intrusion in the Floridan Aquifer,
W74-06609 2F

SALINITY
Evaporation from Brine Storage Reservoirs,
W74-06517 2D

SALMON
Relative Recoveries of Hatchery-Reared Landlocked Salmon Planted at Different Ages at Schoodic Lake, Maine,
W74-06865 8I

SALMONELLA TYPHI
Survival in Maturation Ponds of Coliform Bacteria With Transferable Drug Resistance,
W74-06748 5C

SALTON SEA (CALIF)
A Simulation Approach to Recreation Planning (A Case of Changing Quality),
W74-06996 6B

SAMPLE PRESERVATION
Growth of Streptococcus cremoris and Streptococcus lactis in a Chemostat. Production of Cells and Survival of Bacteria during Frozen Storage,
W74-06762 5C

Analytical Methodology for Mercury-Discussion Paper,
W74-06793 5A

SAMPLING
Start-Up of Municipal Wastewater Treatment Facilities,
W74-06578 5D

Some Estimates of Natural Levels of Mercury in the Environment,
W74-06772 5B

Mercury in Fish in the Great Lakes,
W74-06774 5B

Survey of Mercury Concentrations in Fishes of Lakes St. Clair, Erie, and Huron,
W74-06775 5B

Analytical Methodology for Mercury-Discussion Paper,
W74-06793 5A

A Radioactive Isotopic Characterization of the Environment Near Wiscasset, Maine: A Preoperational Survey in the Vicinity of the Maine Yankee Atomic Power Plant,
W74-06855 5A

(Radiation Data, Section II. Water).
W74-06856 5A

An Isokinetic Sampler for Wind Erosible Silt and Clay Particle Measurement,
W74-06902 2J

SAND FILTERS
Intermittent Sand Filtration to Upgrade Existing Wastewater Treatment Facilities,
W74-06506 5D

SAPROPHYTIC COLONIZATION
Competitive Saprophytic Colonization by Fusarium oxysporum F. Sp. vasinfectum,
W74-07011 3F

SATELLITES (ARTIFICIAL)
Symposium on Significant Results Obtained From the Earth Resources Technology Satellite-1, Volume I: Technical Presentations, Section B.
W74-06619 7C

Advanced Scanners and Imaging Systems for Earth Observations.
W74-06712 7B

SATURATED FLOW
Measurements of the Downslope Flow of Water in a Soil,
W74-06886 2G

SATURATED SOILS
Unsteady Radial Flow in Partially Saturated Soils,
W74-06587 2G

SATURATION
Degree of Local Saturation of a Flow by Suspended Matter and Its Relation to the Volume Concentration,
W74-06913 8B

SAVANNAH RIVER (GA)
Final Environmental Statement Related to the Proposed Alvin W. Vogtle Nuclear Plant Units 1, 2, 3, and 4.
W74-06821 5B

SCALING
Nitrogen Removal by Ammonia Stripping,
W74-06842 5D

SCALLOPS
Growth Comparisons of Oysters, Mussels and Scallops Cultivated on Algae Growth With Artificial Medium and Treated Sewage Effluent,
W74-07035 5C

SEA ICE
New Insights into the Influence of Ice on the Coastal Marine Environment of the Beaufort Sea, Alaska,
W74-06669 2C

Use of ERTS Data for Mapping Arctic Sea Ice,
W74-06676 2C

Investigations Performed on the Arctic Ice Dynamics Joint Experiment, March 1971,
W74-06716 2C

Mesoscale Strain Measurements on the Beaufort Sea Pack Ice,
W74-06717 2C

Structure of a Multiyear Pressure Ridge,
W74-06718 2C

Top and Bottom Roughness of a Multiyear Ice Floe,
W74-06719 2C

Airphoto Analysis of Ice Deformation in the Beaufort Sea,
W74-06720 2C

Data on Morphological and Physical Characteristics of Sea Ice in the Beaufort Sea,
W74-06721 2C

SEA WATER
Phosphorimetric Determination of Traces of Boron,
W74-06755 5A

SEABED RESOURCES
Recent Developments in the Law of the Sea IV: A Synopsis,
W74-06965 6E

Seamounts and Guyots: A Unique Resource,
W74-06966 6E

SEAGRASSES
Some Comments on Seagrasses and Sedimentary Processes,
W74-06922 2J

SEAMOUNTS
Seamounts and Guyots: A Unique Resource,
W74-06966 6E

SEASONAL
Distribution and Seasonal Variations of the Plankton in 'Riviere de Morlaix,' (In French),
W74-07012 5C

SEDIMENT TRANSPORT
Plume Development in Long Island Sound Observed by Remote Sensing (ERTS-1),
W74-06668 2L

ERTS-1 Observations of Sea Surface Circulation and Sediment Transport, Cook Inlet, Alaska,
W74-06670 2L

Sediment Distribution and Coastal Processes in Cook Inlet, Alaska,
W74-06671 2L

The Influence of Clay Fraction on the Basic Parameters of the Hydro-Transport of Fine Free-Flowing Materials,
W74-06914 8B

Energy Losses in a Two-Phase Flow Containing Coarse-Grain Material,
W74-06916 8B

SEDIMENT-WATER INTERFACE
Denitrification as a Pathway for Nitrate Removal in Aquatic Systems,
W74-06612 5B

SEDIMENTATION
Seasonal Changes of Littoral Transport and Beach Width and Resulting Effect on Protective Structures,
W74-06664 2L

Recognition of Beach and Nearshore Depositional Features of Chesapeake Bay,
W74-06665 2L

Materials Input of Lake Champlain: A Synoptic Appraisal,
W74-06882 2H

Reservoir Sedimentation,
W74-06883 2J

Some Comments on Seagrasses and Sedimentary Processes,
W74-06922 2J

SEDIMENTS
Mercury Contents of Bottom Sediments from Wisconsin Rivers and Lakes,
W74-06777 5B

Mercury in the Lake Michigan Environment,
W74-06779 5B

Distribution of Mercury in the Environment of Minamata Bay and the Inland Ariake Sea,
W74-06781 5B

SEED TREATMENT
Organic Mercury Poisoning in Alamogordo, New Mexico,
W74-06807 5C

Survival and Reproduction of Ring-Necked Pheasants Consuming Two Mercurial Fungicides,
W74-06808 5C

SEEPAGE
On the Leakage Assumption Applied to Equations of Groundwater Flow,
W74-06888 2F

SELENASTRUM CAPRICORNUTUM
Biological Response to Detergent and Nondetergent Phosphorus in Sewage - Part II,
W74-06873 5C

SEPARATION TECHNIQUES
An Appraisal of Neutralization Processes to Treat Coal Mine Drainage,
W74-06512 5D

New Methods of Nitrite and Nitrate Analysis for Natural Waters,
W74-06836 5A

Semimicrodetermination of Mercury(II) and Zinc(II) by Precipitation from Homogeneous Solution, Using Cation Generation Technique,
W74-06869 5A

SESTON
Energetics of Daphnia Ambigua,
W74-06831 5C

SETTLING VELOCITY
Mathematical Model for Barged Ocean Disposal of Wastes,
W74-06837 5B

SEWAGE
Growth Comparisons of Oysters, Mussels and Scallops Cultivated on Algae Growth With Artificial Medium and Treated Sewage Effluent,
W74-07035 5C

SEWAGE DISPOSAL
Sewage Collection Facilities.
W74-06980 6E

SEWAGE EFFLUENTS
Biological Response to Detergent and Nondetergent Phosphorus in Sewage - Part II,
W74-06873 5C

Phytoplankton Successions and Lake Dynamics in Las Vegas Bay, Lake Mead, Nevada,
W74-07001 5C

SEWAGE LAGOONS
Epiphytic Microphytes in a Pond Polluted with Beet Sugar Factory Wastes,
W74-06551 5C

Protozoans in Ponds Filled with Sugar Factory Wastes,
W74-06552 5C

Macrobenthos of Ponds with Sugar Factory Wastes,
W74-06553 5C

Survival in Maturation Ponds of Coliform Bacteria With Transferable Drug Resistance,
W74-06748 5C

SEWAGE TREATMENT
Utilization of Trickling Filters for Dual Treatment of Dry and Wet Weather Flows,
W74-06508 5D

Demonstration of a Non-Aqueous Sewage Disposal System,
W74-06519 5D

Nitrogen Elimination by Bogus Alternation of Aerobic/'Anoxic' Conditions in 'Orbal' Activated Sludge Plants,
W74-06605 5D

Sewage Treatment Facilities, State Grants.
W74-06979 6E

Search for a Method for Sanitizing Sewage from Helminth Eggs Using Agrochemical Means. (Preliminary Communication), (In Russian),
W74-07018 5D

SEWERAGE
Sewage Collection Facilities.
W74-06980 6E

SHAGAWA LAKE (MINN
Modeling Algal Growth Dynamics in Shagawa Lake, Minnesota, with Comments Concerning Projected Restoration of the Lake,
W74-06563 5C

SHORELINE STABILIZERS (PLANTS)
Florida Mangroves as Shoreline Stabilizers,
W74-07047 4A

SICILY
A Preliminary Evaluation of ERTS-1 Images on the Volcanic Areas of Southern Italy (NASA Contract FO-013),
W74-06691 7C

SILVER
Silver Concentrations in Antarctic Snow and Firn,
W74-06930 5A

SIMULATED RAINFALL
Effect of Varying the On-Off Time of Rainfall Simulator Nozzles on Surface Sealing and Intake Rate,
W74-06903 2J

SIMULATION ANALYSIS
Micro-Ecosystems Simulation of Primary Production in Thermal and Acid Mine Water Loadings Related to Water Use of the Monongahela River,
W74-06507 5C

A Simulated Environmental Model of Temperature, Evaporation, Rainfall, and Soil Moisture,
W74-06591 3F

Techniques for Identifying and Evaluating Market and Nonmarket Benefits and Costs of Water Resource Systems.
W74-06852 6B

A Simulation Approach to Recreation Planning (A Case of Changing Quality),
W74-06996 6B

Systems Analysis in the Marion Lake IBP Project,
W74-07010 5C

SITES
Geologic and Hydrologic Background for Selecting Site of Pilot-Plant Repository for Radioactive Waste,
W74-06820 5B

Final Environmental Statement Related to the Proposed Alvin W. Vogtle Nuclear Plant Units 1, 2, 3, and 4.
W74-06821 5B

SLIMES DAMS
The Impact of Slimes-Dam Formation on Water Quality and Pollution,
W74-06604 5B

SLOPES
Sensitivity of Surface Runoff to Variations of Watershed Parameters in Small Urban Areas-A Kinematic Model,
W74-06853 4C

SLUDGE
An Appraisal of Neutralization Processes to Treat Coal Mine Drainage,
W74-06512 5D

SLUDGE DISPOSAL
Information Resource: Final Report Water Pollution Control in Water Utilities,
W74-06527 5F

Sludge Disposal to Land,
W74-06950 5B

SLUDGE TREATMENT
Information Resource: Final Report Water Pollution Control in Water Utilities,
W74-06527 5F

SMALL WATERSHEDS
Changes in Water Yield of Small Watersheds by Agricultural Practices,
W74-06597 2E

SNOW COVER
Snow Cover Surveys in Alaska From ERTS-1 Data,
W74-06697 2C

SNOWPACKS
PB-210 Concentration in Ice Measured at South Pole Station,
W74-06932 5A

SOIL ALGAE
The Genus Neochloris Starr (Chlorophyceae, Chlorococcales),
W74-06760 5A

Lead Inhibition of Hormotila blennista (Chlorophyceae, Chlorococcales),
W74-06761 5C

SOIL AMENDMENTS
Deep Plowing and Chemical Amendment Effect on a Sodic Claypan Soil,
W74-06598 3F

SOIL CHEMICAL PROPERTIES
Quality Improvement of Feedlot Lagoon Water by Percolation Through Soil Under Native Pasture,
W74-06830 5D

SOIL CHEMISTRY
Nitrogen Mineralization-Water Relations in Soils,
W74-06897 5B

Transformation of Iron in a Waterlogged Soil as Influenced by Redox Potential and pH,
W74-06934 5B

SOIL COLUMNS
A Multichannel Syringe Pump for Steady State Flow in Soil Columns,
W74-07028 2G

SOIL CONSERVATION
Soil and Water Losses as Affected by Tillage Practices,
W74-06595 3F

SOIL CONTAMINATION
Distribution of Mercury in Residual Soils,
W74-06797 5B

The EXREM III Computer Code for Estimating External Radiation Doses to Populations from Environmental Releases,
W74-06818 5B

SOIL EROSION
Estimating Soil Erosion from the Redistribution of Fallout Cs-137,
W74-06901 2J

An Isokinetic Sampler for Wind Erosible Silt and Clay Particle Measurement,
W74-06902 2J

Effect of Varying the On-Off Time of Rainfall Simulator Nozzles on Surface Sealing and Intake Rate,
W74-06903 2J

SOIL MANAGEMENT
Evaluation of a Furrow Modifying Device,
W74-06588 3F

Deep Plowing - An Engineering Appraisal,
W74-06590 3F

Deep Plowing and Chemical Amendment Effect on a Sodic Claypan Soil,
W74-06598 3F

Hurricane Creek Watershed Project, Humphreys and Dickson Counties, Tennessee (Final Environmental Impact Statement).
W74-06988 4D

SOIL MOISTURE
Development of Asphalt Moisture Barrier Equipment,
W74-06586 3F

Unsteady Radial Flow in Partially Saturated Soils,
W74-06587 2G

A Simulated Environmental Model of Temperature, Evaporation, Rainfall, and Soil Moisture,
W74-06591 3F

In Situ Spectroradiometric Quantification of ERTS Data,
W74-06663 2G

Nitrogen Mineralization-Water Relations in Soils,
W74-06897 5B

Field Measurement of Evaporation from Soil Shrinkage Cracks,
W74-06900 2D

Competitive Saprophytic Colonization by Fusarium oxysporum F. Sp. vasinfectum,
W74-07011 3F

Soil Moisture Distribution During Two-Dimensional Absorption from a Cylindrical Source,
W74-07042 2G

SOIL PERCOLATOR
A Simple Automatic Soil Percolator,
W74-06531 7B

SOIL PHYSICS
Application of Monte Carlo Method to Soil Water Movement,
W74-06599 2G

SOIL SURVEYS
Identification of Soil Associations in Western South Dakota on ERTS-1 Imagery,
W74-06629 2G

SOIL TEMPERATURE
Use of Waste Heat for Soil Warming in North Carolina,
W74-07000 5D

SOIL TREATMENT
Evaluation of a Furrow Modifying Device,
W74-06588 3F

SOIL WATER
Field Measurement of Evaporation from Soil Shrinkage Cracks,
W74-06900 2D

Evaluation of Influence of Available Soil Water Storage Capacity on Growing Season Length and Yield of Tropical Pastures Using Simple Water Balance Models,
W74-06927 3F

SOIL WATER MOVEMENT
Application of Monte Carlo Method to Soil Water Movement,
W74-06599 2G

Gravity Correction Due to a Variation of Pressure Head Within a Cavity,
W74-06734 2G

Measurement of Hydraulic Conductivity By Means of Steady, Spherically Symmetric Flows,
W74-06735 2G

Solution of Equation for Vertical Unsaturated Flow of Soil Water,
W74-06736 2G

Upward Flow from Shallow Water Tables,
W74-06844 2F

Measurements of the Downslope Flow of Water in a Soil,
W74-06886 2G

Solute Movement Through Disturbed and Undisturbed Soil Cores,
W74-06935 5B

SOILS
Gray Forest Soils in the Spruce-Fir Forests in the Sub-Ural Region (Vyatka-Kama Province), (In Russian),
W74-07004 2G

Seasonal and Stratigraphic Controls in Coastal Floodplain Soils,
W74-07030 2G

SOLAR RADIATION
A Technique for Correcting ERTS Data for Solar and Atmospheric Effects,
W74-06648 7C

SOLUBILITY
Ionic State and Coordination of Iron in Bog Lakes,
W74-06744 5C

SOLUTES
Solute Movement Through Disturbed and Undisturbed Soil Cores,
W74-06935 5B

SORPTION
Nitric Oxide Sorption by Calcareous Soils: II. Effect of Moisture on Capacity, Rate, and Sorption Products,
W74-06894 5B

Kinetics of the Phosphate Interaction with Calcite,
W74-06895 5B

SORPTIVITY
One-Dimensional Vertical Infiltration,
W74-07034 2G

SOUTH AFRICA
Water Quality Control,
W74-06603 5G

The Impact of Slimes-Dam Formation on Water Quality and Pollution,
W74-06604 5B

An Ecological Account of the Past and Future of South African Rivers,
W74-06606 5C

SOUTH AFRICA (VAAL RIVER)
The Effect of Pollution on the Vaal River Barrage and the Quest for Water Quality,
W74-06607 5B

SOUTH CAROLINA
Wando River Environmental Quality Studies, An Interim Report.
W74-06919 5B

Groundwater Use Act of 1969.
W74-06973 6E

SOUTH DAKOTA
Demonstration of a Non-Aqueous Sewage Disposal System,
W74-06519 5D

Identification of Soil Associations in Western South Dakota on ERTS-1 Imagery,
W74-06629 2G

DCP-Collected Absolute Target Reflectance Signatures Assist Accurate Interpretation of ERTS-1 Imagery,
W74-06688 7C

SOUTHEAST U
Legal Impediments to the Use of Interstate Agreements in Coordinated Fisheries Management Programs: States in the N.M.F.S. Southeast Region,
W74-06991 6E

SOUTHWEST MANITOBA
Changes in Water Chemistry Accompanying Summer Fish Kills in Shallow Eutrophic Lakes of Southwest Manitoba,
W74-06541 5C

SOUTHWEST U
Geothermal Development and Southwest Storage Basins,
W74-06945 4B

SOVEREIGNTY
Recent Developments in the Law of the Sea IV: A Synopsis,
W74-06965 6E

Seamounts and Guyots: A Unique Resource,
W74-06966 6E

SOVIET UNION
Geography of Waterfowl Resources of the Soviet Union. Condition of Reserves.
W74-06559 6B

SPATIAL DISTRIBUTION
The Role of Thermocline Migration in Regulating Algal Blooms,
W74-06566 5C

SPECIATION
Yamadaphycus, a New Genus of the Delesseriaceae (Rhodophyta),
W74-06753 5A

SPECIES DIVERSITY INDEX
Stream Pollution and a Simplified Diversity Index,
W74-06876 5A

SPECIFIC YIELD
Capillary Properties of Soils - Influence upon Specific Yield,
W74-06584 2F

SPECTROPHOMETRY
Determination of Mercury in Biological Tissues,
W74-06790 5A

SPECTROPHOTOMETERY
Cancellation of Spectrophotometer System Characteristics Using an Analog Computer,
W74-06874 2K

SPECTROPHOTOMETRY
Mercury Content of Canadian Foods and Cereals Determined by Different Methods,
W74-06787 5A

SPECTRORADIOMETRY
In Situ Spectroradiometric Quantification of ERTS Data,
W74-06663 2G

SPECTROSCOPY
Evaluation of a Microwave-Induced Plasma Spectrometer for Trace Analysis,
W74-06841 5A

An Atomic Absorption Analysis Method for Cyanide,
W74-06999 5A

SPILLWAYS
Developing Region in Self-Aerated Flows,
W74-06739 8B

SPRINGS
The Problem of Direct Groundwater Discharge to the Seas,

STATISTICAL METHODS
Sample Sizes Required for Two-Sided Comparisons of Two Treatments With a Control,
W74-06746 7C

Assessing Systematic Errors in Rainfall-Runoff Models,
W74-06893 2A

Determination of the Confidence Intervals of the Pearson III Law Using Order Statistics (Determination des intervalles de confiance de la loi Pearson III par les statistiques d'ordre),
W74-06906 2E

STEADY-STATE SLOW
A Multichannel Syringe Pump for Steady State Flow in Soil Columns,
W74-07028 2G

STORAGE
Analytical Methodology for Mercury-Discussion Paper,
W74-06793 5A

STORAGE TANKS
241-T-106 Tank Leak Investigation.
W74-06861 5B

STORM RUNOFF
Stormwater Runoff Quality for Urban and Semi-Urban/Rural Watersheds,
W74-06851 5B

STRATIFICATION
Distribution and Mixing of Inflow into Stratified Lakes: A Hydraulic Model Study, (Phase I),
W74-06618 2H

STRATIGRAPHIC CONTROLS
Seasonal and Stratigraphic Controls in Coastal Floodplain Soils,
W74-07030 2G

STREAMS
Stream Temperatures in Washington State,
W74-06962 7C

STRENGTH
Comparison of Strength Test Methods for Corrugated Plastic Drainage Tubing,
W74-06602 8A

STREPTOCOCCUS
Growth of Streptococcus cremoris and Streptococcus lactis in a Chemostat Production of Cells and Survival of Bacteria during Frozen Storage,
W74-06762 5C

STRIP MINES
Geographic Applications of ERTS-1 Data to Landscape Change,
W74-06628 4A

STRIP MINING
Mapping of Spoil Banks Using ERTS-1 Pictures,
W74-06695 5A

STURGEON (ATLANTIC)
Atlantic Sturgeon (Acipenser sturio) in Waters of Georgia, (In Russian),
W74-07016 2H

STYLOSANTHES-HUMILIS
Evaluation of Influence of Available Soil Water Storage Capacity on Growing Season Length and Yield of Tropical Pastures Using Simple Water Balance Models,
W74-06927 3F

SUB-LETHAL EFFECTS
Interaction of Temperature and Copper Ions as Orienting Stimuli in the Locomotor Behavior of the Goldfish (Carassius auratus),
W74-06769 5C

SUBCLINICAL EFFECTS
Detection and Appraisal of Subclinical Intoxications,
W74-06810 5C

Approaches to the Detection of Subclinical Mercury Intoxications: Experience in Minamata, Japan,
W74-06811 5C

Epidemiological Approaches to the Study of Subclinical Effects of Mercury Intoxication,
W74-06813 5B

SUBMARINE SPRINGS
The Problem of Direct Groundwater Discharge to the Seas,
W74-06881 2F

SUBSURFACE DRAINS
Hydraulic Roughness of Corrugated Plastic Tubing,
W74-06589 8B

SUBSURFACE RUNOFF
Measurements of the Downslope Flow of Water in a Soil,
W74-06886 2G

SUGAR FACTORY WASTES
Epiphytic Microphytes in a Pond Polluted with Beet Sugar Factory Wastes,
W74-06551 5C

Protozoans in Ponds Filled with Sugar Factory Wastes,
W74-06552 5C

Macrobenthos of Ponds with Sugar Factory Wastes,
W74-06553 5C

SURFACE-GROUNDWATER RELATIONSHIPS
Walden's Way Revealed,
W74-06925 2H

SURFACE IRRIGATION
Mathematical Model of Water Advance in Border Irrigation,
W74-06582 3F

SURFACE WATERS
Hydrology and Water Resources of the Hoosic River Basin, Massachusetts,
W74-06958 7C

SURGES
Eight Years of Observations on the Water Level at Quebec and Grondines 1962-1969: Part I--Analysis of the Tidal Signal,
W74-06926 2E

SURVEILLANCE PROGRAM
(Radiation Data, Section II. Water).
W74-06856 5A

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U. S. Geological Survey, U. S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 7, NUMBER 14
JULY 15, 1974

W74-07051 -- W74-076000

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $45 (domestic), $56.25 (foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 7, NUMBER 14
JULY 15, 1974

W74-07051 -- W74-07600

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

OSS-SPECTRAL ANALYSIS OF RAINFALL ID RUNOFF FOR RARITAN AND MULLICA VER BASINS IN NEW JERSEY,
tgers - The State Univ., New Brunswick, N.J. pt. of Civil and Environmental Engineering.
L. Bourodimos, and A. M. Oguntuase.
urnal of Hydrology, Vol 21, No 1, p 61-79, nuary 1974. 9 fig, 1 tab, 11 ref.

escriptors: *Rainfall-runoff relationships, atistical methods, *Correlation analysis, Fourier alysis, Time series analysis, *New Jersey, ochastic processes.
entifiers: *Cross-spectral analysis, *Raritan ver basin(N.J.), *Mullica River basin(N.J.).

Cross-correlation and cross-spectral analysis were employed in the analysis of rainfall and runoff in two river basins: the Raritan and Mullica River basins in New Jersey. Cross-covariance and coherence were studied in the correlograms for the following cases: (a) rainfall-runoff for each basin separately; (b) rainfall-rainfall analysis for two main meteorological stations in each of the basins; (c) runoff-runoff for two main gaging stations in each of the basins. From the estimates of the coherence at various frequencies, the cross-spectral analysis shows a highly nonlinear relationship between rainfall and runoff. A poor coherence of the annual cycles for each basin makes it difficult to predict the annual oscillations of runoff from those of rainfall by a linear regression model. The high coherence between rainfall (or runoff) at the first station and rainfall (or runoff) at the second station within the same basin at almost all frequencies establishes an accurate prediction on a linear basis. SOME GENERALIZED BETA DISTRIBUTIONS OF THE SECOND KIND HAVING DESIRABLE APPLICATION FEATURES IN HYDROLOGY AND METEOROLOGY,
Colorado State Univ., Fort Collins. Dept. of Statistics.
P. W. Mielke, Jr., and E. S. Johnson.
Water Resources Research, Vol 10, No 2, p 223-226, April 1974. 3 tab, 9 ref.

Descriptors: *Statistics, *Statistical methods, *Simulation analysis, Sampling, Variability, Statistical models, Mathematical studies.
Identifiers: Distribution functions.

Two distinct versions of the generalized beta distribution of the second kind are considered. These beta-type distributions compare favorably with the commonly used gamma and log normal distributions in their ability to fit selected sets of accumulated streamflow and precipitation amount data. The comparisons are based on empirical results associated with three different goodness of fit criteria. Since the cumulative distribution functions of these beta-type distributions are in closed form, they possess unique computational advantages over the gamma and log normal distributions. (Knapp-USGS)
W74-07412

ALGEBRAIC BOUNDEDNESS OF SAMPLE STATISTICS,
Geological Survey, Reston, Va. Water Resources Div.
W. Kirby.
Water Resources Research, Vol 10, No 2, p 220-222, April 1974. 1 tab, 2 ref.

Descriptors: *Statistics, *Statistical methods, *Simulation analysis, Sampling, Variability, Statistical models, Mathematical studies.
Identifiers: Distribution functions.

Some puzzling results from a computer simulation study are explained by showing that the sample skew coefficient has population-independent bounds depending only on the sample size. Similar results are obtained for the coefficient of variation of positive data, the maximum standardized deviate, and the standardized range. These bounds are called algerbraic bounds to emphasize that they are properties of the algebraic formulas defining the statistics; they are totally independent of any assumptions about the processes generating the samples for which the statistics are computer. (Knapp-USGS)

JUST A MOMENT,
IBM Thomas J. Watson Research Center, Yorktown Heights, N.Y.
J. R. Wallis, N. C. Matalas, and J. R. Slack.
Water Resources Research, Vol 10, No 2, p 211-219, April 1974. 6 fig, 4 tab, 8 ref.

Descriptors: *Statistics, *Statistical methods, *Monte Carlo method, Mathematical studies, Variability, Probability, Distribution patterns.
Identifiers: *Distribution functions.

The distribution functions for three statistics, the mean, standard deviation and coefficient of skewness, for small samples from various distributions were obtained by Monte Carlo experiments. Sample sizes of 10 (10) 90 were considered, and the distributions used were the normal, Gumbel (extreme value type 1), log normal, Pearson type 3 (gamma), Weibull, and Pareto type 1 (Pearson type 4). Values of the coefficient of skewness used in generating the samples were in the range 0.0 to 15.0. Pronounced skews, biases, and constraints in the sampling properties of the statistics were observed. Examples of the available graphs of the distribution functions are presented. (Knapp-USGS)

GENERATION MODELS FOR SYNTHETIC ANNUAL AND MONTHLY FLOWS FOR SOME INDIANA WATERSHEDS,
Purdue Univ., Lafayette, Ind. School of Civil Engineering.
J. W. Delleur, and I. T. Kisisel.
Indiana Academy of Science Proceedings, Vol 2, p 208-213, 1972. 2 fig, 1 tab, 7 ref. OWRR-A-020-IND (4).

Descriptors: *Model studies, *Hydrograph analysis, *Time series analysis, *Watersheds(Basins), *Indiana, Flow, Markov processes, Discharge, Runoff, Precipitation, Geomorphology, *Synthetic hydrology.
Identifiers: *Autoregressive process, Fiering type logarithms.

A first order autoregressive process can be used to generate annual flows. The mean annual flow and the rank one serial correlation coefficient were related to watershed and climatological properties. A first order Markov process of the Fiering type adequately simulates the sequence of normalized logarithms of monthly flows. The means and standard deviations of the logarithms of the monthly flows and the autoregressive constant were related to climatological and basin characteristics.
W74-07431

A COMPUTER ATLAS OF HYDROLOGIC AND GEOMORPHOLOGIC DATA FOR SMALL WATERSHEDS IN INDIANA,
Purdue Univ., Lafayette, Ind. School of Civil Engineering.
J. W. Delleur, M. T. Lee, and D. Blank.
Indiana Academy of Science Proceedings, Vol 82, p 222-226, 1972. 1 fig, 11 ref. OWRR B-008-IND (14).

Descriptors: *Geomorphology, *Drainage density, *Small watersheds, *Indiana, *Maps, Topog-

raphy, Streams, Hydrologic data, Networks, Data processing, Computers, Rainfall, Runoff, Drainage patterns, Contours, Hydrologic analysis, Unit hydrograph, Hydrologic models.
Identifiers: *Geomorphologic data, *Stream network, Instantaneous hydrographs.

Banks of hydrologic and geomorphologic data for Indiana small watersheds were prepared for computer use. Four major types of data were collected: rainfall and runoff data for 55 watersheds; and drainage networks and topographic data for 34 of these watersheds. The data were loaded on four magnetic tapes. The first tape contains the single storm rainfalls and runoffs; the second, the single storm rainfall excesses and direct runoff hydrographs; the third, the planforms of stream networks; and the fourth, the elevation contours of the watersheds. Such data are useful in hydrograph analysis, estimation of instantaneous hydrographs, identification and calibration of hydrologic models for runoff estimation. They have applications in drainage design, development and management of water resources.
W74-07432

COMPARISON OF RAINFALL-RUNOFF MODELS FOR URBAN AREAS,
India Inst. of Tech., Kanpur.
P. B. S. Sarma, J. W. Delleur, and A. R. Rao.
Journal of Hydrology, Vol 18, p 329-347, 1973. 6 fig, 3 tab, 20 ref. OWRR B-002-IND(6).

Descriptors: *Urban runoff, *Instantaneous unit hydrograph, *Rainfall-runoff relationships, *Precipitation excess, Urban drainage, Base flow, Mathematical models, Hydrographs.
Identifiers: Fourier transform method, Nash model, Double routing method, Linear channel-linear reservoir method.

The relative regeneration performances of five linear rainfall excess-direct runoff models are compared for several urban watersheds with varying degrees of development. The five models considered are the single linear reservoir, the Nash model, the double routing method, the linear channel-linear reservoir model and the instantaneous unit hydrograph (IUH) obtained by the Fourier transform method. The IUH always gives the best regeneration performance among the four conceptual models tested. The optimized single linear reservoir constant differs from the theoretical time lag value, but is related to the latter, and for each watershed varies from storm to storm. For larger watersheds the Nash model gives the best regeneration performance among the four conceptual models tested. The model parameters for each watershed are found to vary from storm to storm. The quality of regeneration for larger basins is less than that found for the smaller basins.
W74-07463

A RAINFALL-RUNOFF MODEL BASED ON THE WATERSHED STREAM NETWORK,
Purdue Univ., Lafayette, Ind. School of Civil Engineering.
J. W. Delleur, and M. T. Lee.
In: Proceedings, Symposium on the Design of Water Resources Projects With Inadequate Data, Madrid, Spain, p 75-87, June 1973. 4 fig, 19 ref. OWRR B-008-IND(13).

Descriptors: *Rainfall-runoff relationships, *Hydrographs, *Overland flow, *Slopes, *Drainage density, *Remote sensing, *Aerial photography, Geomorphology, Precipitation, Runoff, Base flow, Percolation, Drainage systems, Stream flow, Aerial sensing, Photography, Physical models, Watersheds(Basins), Networks.
Identifiers: *Stream network, Stream order, Infrared color, Dynamic contributing area model, Linear routing.

Physical models of the rainfall-runoff process are better suited than either stochastic or black box models for areas with limited data. The model parameters must have a physical significance, be convenient to obtain and their number should be small. The framework of a model meeting these objectives is proposed and is based primarily on the geomorphologic characteristics of the stream network obtainable from maps or from aerial photographs. There is analytical and experimental evidence that hydrographs are dominated by direct runoff from very short overland flow paths from precipitation on transient, near channel wetlands. This wetland area is dynamic in the sense that it varies in terms of the history of the excess of the precipitation over the 'B' horizon permeability. The distribution of the dynamic contributing area along the main stream is obtained under the assumptions that the velocity of flow along the stream network is uniform, that the drainage density is a constant within a given watershed and that the first order streams are uniformly distributed in the basin. The runoff from the dynamic contributing area is then routed through the synthesized stream network to obtain the direct runoff at the basin outlet.
W74-07464

PROBLEM OF CALCULATING DEPTH OF THE QUASIUNIFORM LAYER OF THE OCEAN (K VOPROSU O RASCHETE TOLSHCHINY KVAZIODNORODNOGO SLOYA OKEANA),
Gidrometeorologicheskii Institut, Leningrad (USSR).
I. N. Rusin.
Meteorologiya i Gidrologiya, No 6, p 62-69, June 1973. 2 fig, 11 ref.

Descriptors: *Oceanography, *Depth, *Boundaries(Surfaces), *Boundary layers, *Temperature, Thermocline, Heat balance, Seasonal, Heat transfer, Turbulence, Mixing, Model studies, Equations.
Identifiers: USSR, Heat flux.

A method of derivation of equations and some solutions to the equations simulating annual movement of the depth of the quasiuniform layer of the ocean are considered. The model was based on laboratory experiments on a study of the propagation of turbulence from a surface into a liquid and on a procedure for constructing boundary conditions at the lower boundary of a quasihomogeneous layer. Despite a large number of simplifications, the model obtained gives a qualitatively true picture of the evolution of the investigated value. (Josefson-USGS)

CALIBRATING A WATER YIELD MODEL FOR SMALL UNGAGED WATERSHEDS,
Kentucky Dept. of Natural Resources, Frankfort. Division of Water.
J. E. Jarboe, and C. T. Haan.
Water Resources Research, Vol 10, No 2, p 256-262, April 1974. 1 fig, 10 tab, 8 ref.

Descriptors: *Water yield, *Mathematical models, *Kentucky, Systems analysis, Rainfall-runoff relationships, Optimization, *Small watersheds.

A four-parameter water yield model was calibrated on 17 Kentucky watersheds by relating the model parameters to watershed topographic, geologic, and soil characteristics. The relationships were tested by comparing observed and simulated runoff records from six watersheds that were not contained in the original 17 watersheds. The results show that the water yield model can be satisfactorily applied to ungaged basins. (Knapp-USGS)
W74-07519

STREAMFLOW SIMULATION: 3. THE BROKEN LINE PROCESS AND OPERATIONAL HYDROLOGY,
Ecole Polytechnique, Montreal (Quebec). Hydraulic Div.
J. M. Mejia, D. R. Dawdy, and C. F. Nordin.
Water Resources Research, Vol 10, No 2, p 242-245, April 1974. 11 ref.

Descriptors: *Synthetic hydrology, *Simulation analysis, *Statistical models, Markov processes, Stochastic processes, Regression analysis, Probability, Variability.
Identifiers: *Hurst phenomenon, Operational hydrology, Broken-line processes.

Broken line processes can be used to produce a standardized Gaussian process. An extension of the theory of the broken line process leading to the generation of processes preserving the mean, the variance, and a skewness coefficient different from zero is presented. The broken line process allows the modeling of cross-correlated sequences, for which it is possible to reproduce the value of H, the second spectral moment for a continuous process or the first serial correlation coefficient for a discrete one, and the first three moments for each of the sequences as well as the lag zero cross correlation among them. In addition, by proper structuring of the broken line process, parameter estimates may be preserved by simple algorithms. The addition of simple broken line processes is a useful operational tool for the synthesis of skewed multivariate sequences exhibiting the Hurst phenomenon. It can be used for continuous as well as discrete processes. (See also W72-13478 and W72-13479) (Knapp-USGS)

OT Y-1301.

Descriptors: *Avalanches, *Snow management,
Washington, Highways, Stress, Strain, Creep,
Mass wasting, Snowpacks, Temperature,
Precipitation(Atmospheric), Snowfall.
dentifiers: *Japan.

The University of Washington program in
valanche studies in the North Cascades is
perated in conjunction with the Washington State
Highway Department. A complete bibliography of
snow clearing methods used in Japan was com-
piled, and Japanese avalanche problems were stu-
died. The observed state of stress in fallen snow
and subsequent mechanics of slab avalanching
were studied. Theory was correlated with ob-
served avalanching. Important mechanical
parameters of the snow are required for the en-
gineering application of the theory. These
strength, glide and creep properties are being col-
lected at test sites in the North Cascades. (Knapp-
USGS)

SNOW ACCUMULATION AND SNOWMELT AS INFLUENCED BY A SMALL CLEARING IN A LODGEPOLE PINE FOREST,
Forest Service (USOA) Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
H. L. Gary.
Water Resources Research, Vol 10, No 2, p 348-353, April 1974. 8 fig, 1 tab, 9 ref.

Descriptors: *Snowpacks, *Forests, *Snowmelt, *Land clearing, *Wyoming, Forest management, Watershed management, Water equivalent, Water yield.

Snow accumulation increased under a thinned lodgepole pine stand about 35 feet tall and 80 years old for two winter seasons before and two seasons after cutting a clearing 1 tree height wide and 5 tree heights long. The clearing was on a gently sloping plateau 9000 feet above msl and was oriented perpendicularly to the prevailing southwest wind. The maximum snowpack water equivalent the first year after clearing averaged 13.1 inches in the upwind forest, 16.2 inches in the clearing, and 12.2 inches in the downwind forest zone. The snow accumulation pattern was similar the second year. The increased snow catch in the clearing was offset by the snow deficit in the downwind forest. The clearing affected the distribution of snow over the area but not the total amount of snow water equivalent. Melt rates in the clearing were about twice those in the interior forest zones. Near the middle of the melt season the clearing as a whole contained 12% less snow water equivalent than the interior forest. (Knapp-USGS)

2D. Evaporation and Transpiration

EVAPOTRANSPIRATION ON A PALOUSE WATERSHED,
Idaho Univ., Moscow. Dept. of Agricultural Engineering.
M. Molnau, and D. J. Davis.
Paper No 73-218 presented at 1973 Annual Meeting, American Society of Agricultural Engineers, University of Kentucky, Lexington, June 17-20, 1973. 9 p, 6 fig, 2 tab, 7 ref. OWRR A-029-IDA (6).

Descriptors: *Evapotranspiration, *Idaho, *Barley, *Soil moisture, *Watershed management, Measurement, Evaporation pans.
Identifiers: *Palouse watershed(Ida-Wash), Penman method.

Evapotranspiration of a spring barley crop was estimated by measuring soil moisture changes. An evaporation pan, the Penman method, and the Jensen-Haise method were used to estimate evapotranspiration. On an overall evaluation, the evaporation pan is unacceptable while the other two methods were acceptable with the Penman method to be preferred.
W74-07087

EVAPORATION FROM AN IRRIGATED RICE CROP IN A SEMI-ARID REGION,
Commonwealth Scientific and Industrial Research Organization, Griffith (Australia). Div. of Irrigation Research.
A. R. G. Lang, G. N. Evans, and P. Y. Ho.
Paper presented at First Australasian Conference on Heat and Mass Transfer at Monash University, Melbourne, Australia, May 23-25, 1973. 6 p, 1 fig, 1 tab, 16 ref.

Descriptors: *Evapotranspiration, *Advection, *Rice, *Flood irrigation, Semi-arid climates, Air-earth interface, Consumptive use, Energy budget, Irrigation effects, Transpiration, Water loss, Water balance, Heat balance, *Australia.

An assessment is made of the fluctuations in evapotranspiration rate associated with the extreme advective conditions of flood-irrigated rice crops bounded by a semi-arid area. The influence of the humid-arid boundary is theoretically examined and compared to experimental measurements of heat and water flux determined along a transect through a rice field. The theoretical equation is found to be an adequate simulation of the field situation. (Muller-Arizona)

EVAPORATION OF WATER FROM SAND: 5. THE EFFECT OF EVAPORATION ON THE CONCENTRATION OF SALTS DISSOLVED IN WATER STORED IN SAND,
National Inst. for Water Research, Windhoek (South-West Africa).
D. H. R. Hellwig.
Journal of Hydrology, Vol 21, No 2, p 101-110, February 1974. 2 fig, 4 tab, 2 ref.

Descriptors: *Evaporation, *Dissolved solids, *Mass transfer, Sands, Capillary action, Salinity, Evaporimeters, Soil water movement, *Salts.

To determine the effect of evaporation on the concentration of salts dissolved in water stored in sand, three different sand mixtures were studied and the water table was maintained at three different levels. After 71 weeks the average salt concentration of the water in each tank was practically the same as it was 12 weeks after the start of the test, which indicated that salts were removed from solution during the test period. When water was transported to the sand surface by capillary action, the salts removed from solution accumulated in a thin sand layer near the sand surface. If capilllary action did not transport water to the sand surface, salts removed from solution were accumulated 10 to 15 cm above the water table. With increasing evaporation, proportionately greater amounts of dissolved salts are removed from water stored in sand. This relationship was expressed as a hyperbolic function. (See also W73-07055 and W73-07056) (Knapp-USGS)

W74-07169

SOLAR EVAPORATION CONTROLLED IRRIGATION SYSTEM,
D. F. Marean.
U.S. Patent No 3,786,832, 4 p, 2 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 918, No 4, p 1414, January 22, 1974.

Descriptors: *Patents, *Irrigation systems, *Evaporation pans, Rainfall, Equipment, Control systems, Surface irrigation, Water distribution(Applied), Solar radiation, Water delivery, Soil water.
Identifiers: *Solar evaporation, Soil moisture.

Control for a land irrigation system is actuated in response to the rate of solar evaporation of water from an evaporator pan and the rate of evaporation from land. These are so related that the pan moves to initiate irrigation only when the land actually requires water. When the pan is filled with water from rainfall or from the supply line, a valve closes to terminate the irrigation operation. However, when solar evaporation of water form the pan has depleted the weight of the water to the extent that the resilient means can pivot the pan to the first pollution, the valve is opened to initiate an irrigation operation. INVESTIGATION OF THE RELATION OF GROUNDWATER EVAPORATION TO LITHOLOGICAL STRUCTURE OF THE ZONE OF AERATION (K IZUCHENIYU ZAVISIMOSTI ISPARENIYA GRUNTOVYKH VOD OT LITOLOGICHESKOGO STROYENIYA ZONY AERATSII),
Institute of Hydrogeology and Engineering Geology, Tashkent (USSR).
K. G. Ganiyev.
Uzbekskiy Geologicheskiy Zhurnal, No 6, p 20-21, 1973. 1 tab, 2 ref.

Descriptors: *Groundwater, *Evaporation, *Petrology, *Zone of aeration, Water table, Evapotranspiration, Lysimeters, Loam, Clay loam, Sands, Cotton, Alfalfa.
Identifiers: *USSR(Uzbek SSR).

Groundwater evaporation depends on climatic and water-management conditions, soil particle size and solid-residue content in groundwater, and on character of the active cover. Evaporation from coarse loam planted to cotton was 60% less than that from clay loam. At lysimeters where alfalfa was grown, evaporation from coarse loamy sand was 58% less than that from clay loam. The relation of groundwater evaporation to lithological composition of soils was established on the basis of data of lysimeter investigations conducted by the Fergana Hydrogeological Station in 1956-62. A SYNTHETIC MODEL FOR DAILY STREAMFLOW,
Birmingham Univ. (England). Dept. of Civil Engineering.
N. M. D. Green.
Journal of Hydrology, Vol 20, No 4, p 351-364, December 1973. 7 fig, 3 tab, 4 ref.

Descriptors: *Streamflow forecasting, *Synthetic hydrology, *Statistical models, Time series analysis, Rainfall-runoff relationships.
Identifiers: *Great Britain(England).

A model for synthesizing daily average streamflow data is presented; it is suitable for most rivers in Great Britain. The method is based on a linear interpolation of the logarithms of 5-day average flows produced using a statistical model. The 5-day model preserves the long-term statistical characteristics of the daily data, while the short-term characteristics such as hydrograph shape are imposed by the interpolation method. A stochastic error term is superimposed on the interpolated daily flows. This term represents the nondeterministic component of the daily time series. The riverflow in the Severn at Bewdley was used to demonstrate both the analysis of actual data and the generation of synthetic data. The technique was applied to data from two other rivers with widely differing characteristics to demonstrate the range of the method. (Knapp-USGS)

AN INVESTIGATION OF FLOODS IN HAWAII THROUGH SEPTEMBER 30, 1973,
Geological Survey, Honolulu, Hawaii.
R. H. Nakahara.
Progress Report No 16 (Basic data release), Jan ry 1974. 175 p, 5 fig, 1 tab.

Descriptors: *Floods, *Hawaii, *Hydrologic da *Flood data, Peak discharge, Data collections

Floods--mainly because of the high frequency intense rainfall--are common in Hawaii Flo damages to crops, homes, highways, and oth facilities, and pollution of bays and estuaries fro storm runoff and sediment discharge occur near every year. Flood data are obtained through a ne work of stream-gaging and peak-discharge statio throughout the State. At the close of the 19 water year, flood data were being collected at regular gaging stations and 103 crest-stage gagi stations on Kauai, Oahu, Molokai, Maui, a Hawaii. Although peaks occurred during months of the year, only the months of Octobe February, and March denoted excessive runo throughout the State. (Knapp-USGS)

WATER-RESOURCES INVESTIGATIONS I TEXAS, FISCAL YEAR 1974.
Geological Survey, Austin, Tex.
Water-Resources Investigations Report, Februar 1974. 34 p.

Descriptors: *Water resources, *Texa *Investigations, Groundwater, Surface water Data collections, Gaging stations, Hydrologi data, Streamgages, Water wells.

Water-resources investigations by the U.S Geological Survey in Texas consist of the collec tion of basic records through the hydrologic-dat network, interpretive studies, and research pro jects. The water-resources projects and activitie of the Geological Survey in Texas for the 197 fiscal year (July 1, 1973, to June 30, 1974) ar described. In Texas, continuing measurements an analyses are made of streamflow, reservoir con tents, chemical quality of water, sediment i streams and reservoirs, water levels in wells, an land-surface subsidence. Modern compute techniques are being used successfully in the col lection and publication of water data. As of June 30, 1973, 567 stream-gaging, stage-only, and reser voir-contents stations were in operation. The fisca 1974 program provides for three water-quality sur veys each of Lake Meredith, Greenbelt Reservoir, Lake Arlington, Livingston Reservoir, Lake Con roe, Hubbard Creek Reservoir, Possum Kingdom Reservoir, Lake Granbury, Whitney Lake, Belton Lake, Canyon Lake, and Lake Corpus Christi, and two surveys of Sam Rayburn Reservoir. Onsite determinations will be made of specific con ductance, dissolved oxygen, temperature, and pH. Samples will be collected for laboratory analyses during each survey. (Knapp-USGS)

ANNUAL COMPILATION AND ANALYSIS OF HYDROLOGIC DATA FOR URBAN STUDIES IN THE SAN ANTONIO, TEXAS METROPOLITAN AREA, 1971,
Geological Survey, Austin, Tex.
R. D. Steger.
Data Report, 1973. 109 p, 1 fig, 4 tab, 3 ref.

Descriptors: *Urban hydrology, *Texas, *Hydrologic data, *Data collections, Urban runoff, Water quality, Recharge, Limestones, Storm runoff, Water pollution sources.
Identifiers: *San Antonio(Tex).

A compilation and analysis of hydrologic data collected in the San Antonio, Texas, urban area for the 1971 water year are presented. The objectives of the San Antonio urban hydrology study are: to provide data showing the effects of various stages of urbanization on flood discharge and runoff, and to provide water-quality data showing chemical constituents, nutrients, biochemical oxygen demand, pesticides, and sediment in surface-water runoff from floods of various magnitudes during all seasons of the year from areas with different types of utilization. Water-quality data have been collected from watersheds in various stages of urban development at most of the gaging stations in the San Antonio urban area. This water-quality program provides data on the concentration of pollutants as a result of runoff from these watersheds. In addition, these data provide a relationship of water-quality parameters to discharge and seasonal conditions. The importance of water quality in this area is unique because of the large amounts of surface-water runoff recharged to the Edwards and associated limestones, which is the major aquifer supplying groundwater for domestic supply, municipal supply, irrigation, and industrial use in the San Antonio area. EFFECT OF AGNES FLOODS ON ANNUAL SERIES IN PENNSYLVANIA,
Pennsylvania State Univ., University Park. Dept. of Civil Engineering.
B. M. Reich.
Available from the National Technical Information Service as PB-231 871; $7.00 in paper copy, $1.45 in microfiche. Pennsylvania State University Institute for Research on Land and Water Resources Research Publication, No 74, July 1973. 72 p, 9 fig, 30 ref. OWRR A-016-PA(4).

Descriptors: *Floods, *Hurricanes, *Pennsylvania, *Historic floods, Peak discharge, Flood frequency, Flood recurrence interval, Statistics, Hydrologic data, Flood forecasting.
Identifiers: *Hurricane Agnes(1972).

Maximum flood discharges for Hurricane Agnes, 1972, on 44 Pennsylvania watersheds were compared with historic flood records. Mathematical frequency curves were fitted to each series according to the Gumbel, log-Gumbel, and log-Pearson Type III methods. The 1972 floods were less than 4.8 times the average annual flood peak in all but 8 of the 44 cases. The threshold was established in previous studies as the ratio between a 1,000-year flood and an average annual flood, equivalent to about a 5% chance of being exceeded by a worse flood once or more in the next 50 years. Most locations have high probabilities of being struck by far worse floods than they experienced in 1972. The worst area of recorded flood during Agnes, measured at the East Mahantango Creek, was 11.5 times its mean annual flood. (Knapp-USGS)

HYDROGEOLOGY OF CARBONATE AND VOLCANIC ROCKS--SIMILARITIES AND CONTRASTS,
Missouri Univ., Columbia. Dept. of Geology.
S. N. Davis.
In: Hawaii Univ., Honolulu, Water Resources Research Center, Water Resources Seminar Series No. 2, December 1972, p 3-9. 2 fig, 1 tab, 15 ref,

Descriptors: *Hawaii, *Aquifer characteristics, *Hydrogeology, *Wells, Chemical properties, Rocks, Permeability.
Identifiers: *Carbonate rocks, Volcanic rocks, Oahu(Hawaii).

The hydrogeologic properties of tuff, chalk, lava flows, and Late Cenozoic rock are examined. Porosity of each is found to be 35-45%, 20-45%, 10-30%, and 15-30% respectively. Permeability of tuff and chalk, however, is so low as to make them poor aquifers, although welded tuff and cherty chalk, both of which are relatively brittle and tend to develop fractures creating rocks with significant permeability, form locally important aquifers in western United States and southeastern Great Britain. In contrast, lava flows of recent volcanic rock exceed 200 darcys in many areas, while Lake Cenozoic rock was found to exceed 400 darcys. A brief examination suggests that the statistical distribution of hydrological properties might provide useful information in regional planning decisions. In particular, it is contended that the knowledge of the statistical distribution of well and gallery yields is of great value in predicting the chances of obtaining a specified well yield for a given investment. DEVELOPMENT OF DIKE STORED WATER BY DRILLING, WAIHEE, OAHU,
Honolulu City and County Board of Water Supply, Hawaii.
C. Lao.
In: Hawaii Univ., Honolulu, Water Resources Research Center, Water Resources Seminar Series No. 2, December 1972, p 63-73, 5 fig, 1 tab, 2 ref,

Descriptors: *Hawaii, *Aquifers, *Aquicludes, Groundwater barriers, Water resources, Drilling, Water supply, Wells, Pressure head.
Identifiers: *Oahu(Hawaii), Waihee Valley(Oahu), Inclined wells.

Development of underground dike storage water by angle drilling is examined through a recent project conducted on Oahu, Hawaii. Dike water represents a valuable asset to the island, both because its higher location allows delivery through gravity flow and because its low content of dissolved minerals and general absence of coliform bacteria. While it is assumed that dike storage represents a large future source of water, the described study's small size prevented an actual determination of the maximum potential. The inclined drilling method was shown to have an approximate 10:1 advantage over the existing method of tunneling. Additionally, drilling results in substatial conservation of water otherwise lost during tunnel construction. A comparison of a horizontal versus the angle drilling method found that while the latter required greater drilling than the former, it also increased the well efficiency such that it represented the best technique. W74-07137

HYDROGEOLOGY OF THE SASSO LUNGO GROUP, A DOLOMITIC REEF STOCK IN THE ALPINE DOLOMITES OF NORTH ITALY,
Vrije Universiteit, Amsterdam (Netherlands). Inst. of Earth Sciences.
G. B. Engelen.
Journal of Hydrology, Vol 21, No 2, p 111-130, February 1974. 10 fig, 2 tab, 5 ref.

Descriptors: *Hydrogeology, *Carbonate rocks, *Dolomite, Limestones, Fractures(Geologic), Water chemistry, Springs, Groundwater movement, *Aquifer characteristics, Aquicludes.
Identifiers: *Italy(Sasso Lungo).

The hydrogeological characteristics of the formations of the Sasso Lungo Group, Italy, are discussed. The central reef mass forms the main

aquifer. It is embedded in impervious formations. The Sasso Lungo group forms an isolated mountain mass in the Italian Dolomites in the SE Alps. The group has an area of 9 sq km and its elevation ranges from plus or minus 2000-3000 m. The central part consists of an exhumed, dolomitized reef of Triassic age, which has subsided by gravity tectonics partly into the surrounding and underlying plastic Permian and Triassic formations. The discharge of snowmelt water and rain takes place through a few large springs around the group at some distance from the reef. The springs are hydraulically connected with low subterranean overflow points in the impervious rim of the reef through natural conduits of permeable moraines and Quaternary valley fills. The central dolomite aquifer shows no signs of karst drainage. The water moves through a dense network of fractures and joints, and it probably has a free, fluctuating water table. Groundwater divides coincide in most cases with surface drainage divides. All springs and surface waters were mapped and sampled during the summer and fall periods from 1966 through 1968. The chemical composition of the spring waters was very useful in tracing their origin. (Knapp-USGS)
W74-07153

CRITICAL ANALYSIS OF THE ALTERNATING DIRECTION IMPLICIT METHOD OF AQUIFER ANALYSIS,
Birmingham Univ. (England). Dept. of Civil Engineering.
K. R. Rushton.
Journal of Hydrology, Vol 21, No 2, p 153-172, February 1974. 8 fig, 1 tab, 6 ref.

Descriptors: *Finite element analysis, *Groundwater movement, *Mathematical models, Aquifers, Equations, Discharge(Water), Water yield, Numerical analysis.

The alternating direction implicit method, when used for aquifer analysis, may produce to erroneous results. By a careful examination of the effect of various factors, such as external boundaries, variable mesh intervals, internal boundaries with fixed heads, re-entrant boundaries and leakage, the occasions when these errors are serious were identified. Techniques which can avoid these errors and lead to reliable numerical solutions are given. (Knapp-USGS)
W74-07154

HEAT DISPERSION EFFECT ON THERMAL CONVECTION IN A POROUS MEDIUM LAYER,
Technion-Israel Inst. of Tech., Haifa. Dept. of Civil Engineering.
H. Rubin.
Journal of Hydrology, Vol 21, No 2, p 173-185, February 1974. 3 fig, 13 ref.

Descriptors: *Convection, *Dispersion, *Diffusion, *Heat transfer, *Porous media, Geothermal studies, Groundwater movement, Mass transfer, Water circulation.

Thermal convection resulting from vertical temperature gradients in porous media was analyzed, taking into account the effect of heat dispersion. Heat dispersion increases the thermal stability of the flow field and may inhabit the appearance of convection currents. Longitudinal as well as lateral dispersivities affect the thermal stability and the dimensions of the convection cells. As a result of convection currents, horizontal streamlines in the steady state are distorted. The convection currents appear as oscillations in the flow field. The frequency of these oscillations depends on the barycentric steady state horizontal flow velocity, the ratio between the longitudinal and lateral dispersivities, and the aquifer thickness. (Knapp-USGS)
W74-07156

KARST PROCESSES OF THE EASTERN UPPER GALILEE, NORTHERN ISRAEL,
Hebrew Univ., Jerusalem (Israel), Dept. of Geography.
R. Gerson.
Journal of Hydrology, Vol 21, No 2, p 131-152, February 1974. 10 fig, 1 tab, 14 ref.

Descriptors: *Karst, *Karst hydrology, *Geomorphology, Limestones, Erosion, Topography, Springs, Water chemistry, Calcium, Magnesium, Water balance, Arid lands.
Identifiers: *Israel(Galilee).

Karst processes dominate most of the geomorphic activity in the Upper Galilee, Israel. The rocks of the area are dolomites and limestones. The major portion of carbonate solute is gained subaerially and in the upper part of the vadose zone. Most cave and spring water is already saturated with respect to aragonite and calcite. The karst depressions are mostly associated with fault-line traces. Their evolution is possible mainly in areas sloping initially less than 15 deg. The absence of evolved caves, representing well-developed karst of an earlier period, is attributed mainly to the marginal climate throughout the past, combined with tectonic and hydrologic instability of the region. The discharge of the karst springs shows clearly dependence on annual precipitation, with a lag of about 2 years of the response to drought or more humid periods. Long-term fluctuations are larger in the smaller T'EO Spring than in the larger 'Enan Springs. Most of the denuded material is extracted from the region as dissolved load via underground conduits and only small amounts as clastics. Mean long-term denudation is approximately 20 mm per 1,000 years, averaged for the surface area contributing to the springs. Most topographic forms are shaped by runoff erosion, active during medium to high intensity rainstorms. Solution processes prevail during low to medium rainfall intensities. Even in karst depressions, erosion becomes dominant after their bottoms are covered by almost impervious terra-rossa mantle. (Knapp-USGS)

Identifiers: *France

A 1-month pumping test was carried out during th summer of 1970 to study the desaturation of th cone of depression, the restoration of the wat level, and rewetting during the recovery phas The observations were continued to evaluate th water movements during an annual cycle. Slo and long-continued drainage was due to the lo permeability of the water-bearing formation Less than half the gravitational water wa removed. The specific yields obtained fro nuclear methods and from other methods based o the transient flow formulae are quite different; a much as 10-15 times smaller for the transient flo methods. In the unsaturated zone the capillar fringe contributed only a small part to the wat flux. In the cone of depression the resaturatio was not complete. During the recharge period water-level rose in the absence of vertical fluxes due to an increase of the level of a nearby rive The water balance obtained from the water co tent measurements is close to that found by th generalized Darcy Law and it yields an acceptabl approximation of infiltration and evapotranspira tion components. The evapotranspiration esti mated by this method is, however, very differen from that derived from the climatic method. Mos of the groundwater recharge is obtained by a fe periods of intense precipitation during which th daily fluxes reach values 100 times higher tha normal inflow. Summer rains can reach th groundwater table when their intensity and timing create conditions favorable for downward flow i the upper soil horizons. (Knapp-USGS)

AQUIFERS IN THE SOKOTO BASIN, NORTHWESTERN NIGERIA, WITH A DESCRIPTION OF THE GENERAL HYDROGEOLOGY OF THE REGION,
Geological Survey, Washington, D.C.
H. R. Anderson, and W. Ogilbee.
Available from GPO, Washington, D.C. 20402. Price $6.75. Water-Supply Paper 1757-L, 1973. 79 p, 10 fig, 11 plate, 12 tab, 25 ref.

Descriptors: *Water resources, *Hydrologic data, *Hydrogeology, *Groundwater, Aquifers, Aquifer characteristics, Africa, Water yield, Water quality, Water wells.
Identifiers: *Nigeria(Sokoto River basin).

Flow in streams of the Sokoto Basin of Nigeria is mostly overland runoff. Only in a few reaches are streams perennial. The sedimentary rocks of the basin range in age from Cretaceous to Tertiary and are composed mostly of interbedded sand, clay, and some limestone; the beds dip gently toward the northwest. These rocks contain three important artesian aquifers, in addition to regional unconfined groundwater bodies. The Gundumi Formation, resting on the basement complex, is composed of clay, sand, and gravel and attains a thickness of 800 to 1,000 feet. Most of the formation does not yield large quantities of water to boreholes. Aquifer tests indicate low transmissivities, ranging from 300 to 5,000 gph per ft in the lower part of the Gundumi Formation; but in the upper sandy zone the transmissivities are much higher, reaching 66,000 gpd per ft. The Rima Group contains an extensive artesian aquifer which is economically important in the Sokoto and Birnin Kebbi areas. In the basal part of the Gwandu Formation is an extensive and productive arte-

sian aquifer contained in a sandy zone a few tens to a few hundred feet thick. In the River Sokoto fadama, considerable potential exists for development of unconfined groundwater from Quaternary alluvium. With the exception of high iron content, the chemical quality of groundwater in the Sokoto Basin is suitable for most uses. Under existing economic conditions, the artesian water can best be utilized for livestock watering, for the domestic requirements of villages, and for municipal and industrial purposes. (Knapp-USGS)

LONG-TERM TRENDS IN GROUNDWATER LEVEL FLUCTUATIONS (MNOGOLETNIYE TENDENTSII V KOLEBANIYAKH UROVNEY POSZEMNYKH VOD),
Akademiya Nauk SSSR, Moscow. Institut Vodnykh Problem.
V. S. Kovalevskiy, N. G. Maksimova, and T. V. Pudova.
Vodnyye Resursy, No 5, p 78-85, 1973. 3 fig, 1 tab, 11 ref.

Descriptors: *Groundwater, *Groundwater resources, *Groundwater movement, *Water level fluctuations, *United States, Observation wells, Maps.
Identifiers: *USSR.

Analysis of longest periods of record of the groundwater regime in the USSR and the United States shows long-term trends toward a rise or decline in groundwater levels characteristic of large regions. The average rate of decline in groundwater levels in observation wells of the United States during the last 30-35 years is 0.16 m/yr, and the average rate of rise in levels is 0.03 m/yr. Groundwater storage in the United States during this period was depleted at an average rate of 0.1 m/yr. During the last 10 years there has been a general depletion of groundwater storage in both the United States and the Soviet Union despite the fact that a reduction in groundwater recharge in some areas was partially compensated by an increase in groundwater recharge in others. These changes are associated with changes in climate and with the economic activities of man. During the last 10 years, groundwater storage in the United States was depleted at an average rate of about 1 cm/yr. Definite patterns of long-term changes in groundwater storage in the USSR are difficult to determine because of the uneven areal distribution of the country's observation network and the short (10-12 year) periods of record in Siberia and the Soviet Far East. Distribution of regions in the United States and the Soviet Union with a predominant long-term rise or decline in groundwater levels is mapped. (Josefson-USGS)

GROUND-WATER RESOURCES OF MCLEAN COUNTY, NORTH DAKOTA,
Geological Survey, Bismarck, N. Dak.
R. L. Klausing.
North Dakota Geological Survey Bulletin 60, Part III, and North Dakota State Water Commission County Ground-Water Studies 19, Part III, 1974. 73 p, 24 fig, 3 plate, 7 tab, 45 ref, append.

Descriptors: *Groundwater, Water resources, *North Dakota, *Glacial drift, Hydrogeology, *Aquifer characteristics, Water yield, Water quality, Hydrologic data.
Identifiers: McLean County(N Dak).

Groundwater in McLean County, North Dakota, is obtainable from aquifers composed of sand and gravel in the glacial deposits and sandstone and lignite in the preglacial rocks. The aquifers with greatest potential for development are those in the glacial deposits. Most are associated with buried valleys and melt-water channels. A large interconnected system of aquifers is associated with buried valleys in east-central McLean County. The aquifers contain about 940,000 acre-feet of groundwater in available storage. Well yields of as much as 1,500 gallons per minute are possible from the Lake Nettie aquifer. Other glacial aquifers have well yields of as much as 1,500 gpm. Well yields of as much as 1,000 gpm should be obtainable from the White Shield aquifer, which occupies a former valley of the Missouri River in western McLean County. Water from the aquifers in the glacial deposits is predominantly a sodium bicarbonate or calcium bicarbonate type and is usually hard to very hard. Wells tapping the Fort Union Group of Paleocene age generally yield from 5 to 75 gpm; however, in places yields as great as 200 gpm may be possible. The water is predominantly a sodium bicarbonate type. Wells tapping the Hell Creek and Fox Hills Formations yield from 10 to 50 gpm. The water is predominantly a sodium bicarbonate type. (Knapp-USGS)

UNDERFLOW IN RIVER VALLEYS OF THE CARPATHO-UKRAINE (PODRUSLOVYY STOK V RECHNYKH DOLINAKH ZAKARPAT'YA),
Akademiya Nauk USSR, Kiev. Instytut Geologichnykh Nauk.
B. Yu. Lyaskovskiy.
Meteorologiya i Gidrologiya, No 6, p 77-83, June 1973. 2 tab, 14 ref.

Descriptors: *Underflow, *Subsurface flow, *Groundwater movement, *Surface-groundwater relationships, *Alluvial channels, *Valleys, Mountains, Streams, Water balance, Geophysics, Hydrometry, Estimating.
Identifiers: *USSR(Carpatho-Ukraine).

Estimates of underflow in major river valleys on the southern slope of the Carpatho-Ukraine (Carpathian Ruthenia) were based on geophysical and hydrometric data. Investigations of underflow were conducted in June-August 1971 in valleys of the Uzh, Latoritsa, Borzhava, Rika, Tereblya, Teresva, Shopurka, and Tisza Rivers. The amount of groundwater discharged in the form of underflow from the southern slope of the Carpathian fold mountains in the region of the Carpatho-Ukraine Neogene Depression is approximately 20 million cu m/yr and must be taken into account in analyzing total water balance of the region. EFFECT OF PARTIAL PENETRATION ON FLOW IN UNCONFINED AQUIFERS CONSIDERING DELAYED GRAVITY RESPONSE,
Agricultural Research Organization, Bet-Dagan (Israel). Inst. of Soils and Water.
S. P. Neuman.
Water Resources Research, Vol 10, No 2, p 303-312, April 1974. 7 fig, 28 ref.

Descriptors: *Groundwater movement, *Unsaturated flow, Water table, Water level fluctuations, Pumping, Water yield, *Storage coefficient, Specific yield, Simulation analysis.

The delayed response process characterizing flow to a well in an unconfined aquifer can be simulated by using constant values of specific storage and specific yield without recourse to unsaturated flow theory. The theory is extended to account for the effect of a well partially penetrating a homogeneous anisotropic unconfined aquifer. Field and laboratory evidence suggests that the elastic storage properties of unconfined aquifers may often be much more pronounced than those of deep-seated confined aquifers composed of similar materials. A NUMERICAL MODEL BASED ON COUPLED ONE-DIMENSIONAL RICHARDS AND BOUSSINESQ EQUATIONS,
Stanford Univ., Calif. Dept. of Geology.
M. F. Pikul, R. L. Street, and I. Remson.
Water Resources Research, Vol 10, No 2, p 295-302, April 1974. 9 fig, 1 tab, 21 ref. NSF Grant GK-26153X.

Descriptors: *Numerical analysis, *Groundwater movement, *Soil water movement, Dupuit-Forchheimer theory, Water table, Vegetation effects, Infiltration, Simulation analysis, Mathematical models.
Identifiers: *Boussinesq theory.

An approximate numerical method to solve transient two-dimensional unsaturated-saturated subsurface flow problems uses several one-dimensional vertical unsaturated column models linked to a one-dimensional saturated flow model. The Dupuit-Forchheimer assumptions are used for the saturated flow, and the unsaturated flow is as-

sumed to be strictly vertical. The systems are linked because solutions of the equation governing unsaturated flow determine recharge and storage and this information is used to solve the equation governing saturated flow. In addition, the position of the water table locates the lower boundaries of the unsaturated models. The solution of a test problem using a linked model was compared with results from a rigorous two-dimensional model. The comparison was good at early times when recharge to the water table is small but poor at later times when recharge increases. Results compare closely with an actual groundwater hydrograph. In addition, a linked model shows that in a humid climate watershed the type of vegetation does not significantly affect the groundwater regimen, whereas in an arid climate watershed the type of vegetation would determine whether groundwater recharge occurred. For field-size problems, where water table movement is relatively small, where the Dupuit-Forchheimer assumptions are valid, and where lateral unsaturated flow is not important, the linked model offers an efficient approximate way to solve unsaturated-saturated flow problems. MATHEMATICAL SIMULATION OF SUBSURFACE FLOW CONTRIBUTIONS TO SNOWMELT RUNOFF, REYNOLDS CREEK WATERSHED, IDAHO,
Agricultural Research Service, Boise, Idaho. Northwest Watershed Research Center.
G. R. Stephenson, and R. A. Freeze.
Water Resources Research, Vol 10, No 2, p 284-294, April 1974. 10 fig, 2 tab, 14 ref.

Descriptors: *Simulation analysis, *Subsurface runoff, *Snowmelt, Groundwater movement, Soil water movement, Base flow, Snowpacks, Mathematical models, *Idaho, Infiltration.
Identifiers: Reynolds Creek(Idaho).

A mathematical model of subsurface flow complements a field study of snowmelt runoff in a small upstream source area in the Reynolds Creek Experimental Watershed near Boise, Idaho. Field measurements from an instrumented cross section of this small watershed show that the mechanism of streamflow generation is subsurface delivery of meltwater over limited distances through shallow high-permeability low-porosity formations of altered and fractured basalt. The mathematical model provides a two-dimensional transient saturated-unsaturated analysis of the subsurface flow at the field site. It was a valuable aid to a unified interpretation of the field measurements. For mathematical models that consist of boundary value problems with boundary conditions that are time and space dependent, the boundary condition sensitivity can thwart the rational calibration-validation procedure. This, together with the more serious limitations of data availability, funds for data acquisition, and computer capacity, precludes the imminent use of fully deterministic hydrologic response models on larger basins or on a regional scale. STEADY STATE FLOW IN RIGID NETWORKS OF FRACTURES,
Leeds, Hill and Jewett, Inc., San Francisco, Calif.
C. R. Wilson, and P. A. Witherspoon.
Water Resources Research, Vol 10, No 2, p 328-335, April 1974. 13 fig, 21 ref.

Descriptors: *Groundwater movement, *Fractures(Geologic), *Laminar flow, Saturated flow, *Finite element analysis, Numerical analysis, Permeability, Steady flow, Networks.

The finite element was used to develop two numerical methods of calculating the flow characteristics of rigid networks of planar fractures. One method uses triangular elements to investigate details of laminar flow in fractures of irregular cross section combined with that of a permeable rock matrix. The other method uses line elements and is designed only for flow in networks of planar fractures in an impermeable matrix. As an example of the application of the finite element approach, the line element method was used to develop a series of dimensionless graphs that characterize seepage in idealized fracture systems beneath dams. These methods treat two-dimensional flow in the laminar regime for networks of fractures of arbitrary orientation and aperture distribution. (Knapp-USGS)

AN EXPERIMENTAL STUDY OF IMMISCIBLE DISPLACEMENT WITH AN UNFAVORABLE MOBILITY RATIO IN POROUS MEDIA,
Purdue Univ., Lafayette, Ind. School of Chemical Engineering.
S. P. Gupta, and R. A. Greenkorn.
Water Resources Research, Vol 10, No 2, p 371-374, April 1974. 3 fig, 1 tab, 16 ref.

Descriptors: *Mixing, *Porous media, *Groundwater movement, Saline water intrusion, Path of pollutants, Flow, Interfaces, Saline water-freshwater interfaces.

Viscous fingering was studied in a glass bead model covering the entire scope of finger development from incipient fingers to a parallel-sided single finger in both miscible and immiscible displacement. As incipient fingers move, they decrease in number. Both decay and merging are simple viscous effects. The rate of growth develops almost immediately, well before the finger is parallel sided. The mechanisms of wavelength generation and degeneration are discussed on physical grounds. (Knapp-USGS)

BROAD SPECTRUM MICROWAVE SYSTEMS FOR REMOTELY MEASURING SOIL MOISTURE CONTENT,
Arkansas Univ., Fayetteville. Dept. of Electrical Engineering.
W. P. Waite, K. R. Cook, and B. B. Bryan.
Available from the National Technical Information Service as PB-231 558, $4.75 in paper copy, $1.45 in microfiche. Arkansas Water Resources Center, Fayetteville, Publication No. 18, November 1973. 166 p, 67 fig, 2 tab, 21 ref. OWRR B-020-ARK(1). 18-31-0001-3557.

Descriptors: *Remote sensing, *Soil moisture, *Microwaves, *Radar, Temperature, Reflectance, Measurement, Soil surfaces, Instrumentation, Surfaces, Algorithms, Electromagnetic waves.
Identifiers: *Radiometric temperature, *Dielectric constant, *Rough surface distortion, Smooth surfaces.

A theoretical and experimental study of the microwave reflectivity of soils with varying moisture content was conducted. A system was developed to measure reflectivity over a continuous frequency range of 4 to 26.5 GHz, at incidence angles from 10 to 70 deg, and with both horizontal and vertical polarization. The measurements were found to be extremely accurate for smooth homogeneous surfaces; however, the effects of surface roughness were more severe than predicted due to the discontinuous nature of naturally occurring rough surfaces. An algorithm was developed which used the frequency dependence of the reflectivity to estimate the effective roughness of the surface and permit correction to an equivalent smooth surface reflectivity which in turn could be related to dielectric constant or percent moisture content. For the frequency range of investigation the maximum mean square height deviation that could be accommodated was approximately one inch. From this it may be concluded that operational airborne or spacecraft sensors must operate in the 500 MHz to 1 GHz range. Even at this reduced frequency it will be impossible to neglect the effects of roughness and a diversity technique such as developed here is essential if an absolute measure of soil moisture is to be made.

SUBSURFACE HEATING AND IRRIGATION OF SOILS: ITS EFFECT ON TEMPERATURE AND WATER CONTENT AND ON PLANT GROWTH,
Oregon State Univ., Corvallis. Dept. of Soil Science.
E. W. R. Barlow, A. R. Sepaskhah, and L. Boersma.
Available from the National Technical Information Service as PB-231 555, $4.50 in paper copy, $1.45 in microfiche. Oregon Water Resources Research Institute, Corvallis, Completion Report WRRI-23, March 1974. 109 p, 39 fig, 27 tab, 108 ref. OWRR B-028-ORE(5).

Descriptors: *Soil temperature, Heating, *Soil treatment, Subsurface irrigation, Plant physiology, *Corn(Field), Crop production, *Heat treatment, *Plant growth.
Identifiers: *Soil heat.

Subsurface irrigation even without heating the soil has given good results in terms of increased yields of crops and decreased water requirements in comparison with other methods of water application. Laboratory experiments were used to study the effect of heat source temperature on the temperature distribution around a line heat source in different soils. Different soil surface heat loads were applied to study the effect of varying climatic conditions on the temperature distributions. Effects of heat source temperature, soil surface temperature, and soil texture on rate of heat dissipation were studied. Water was applied near the heat source to determine the rate of water application required to maintain a constant soil water content at different heat source temperatures. Water content distributions and rates of water application were measured. Concurrent experiments were conducted to determine the effect of lowering root temperature on plant growth by measuring the effects on plant water potential and its relation to leaf elongation, photosynthesis, and transpiration, using young corn plants.

EXPERIMENTAL EVALUATION OF A METHOD FOR DETERMINING UNSATURATED HYDRAULIC CONDUCTIVITY,
North Carolina State Univ., Raleigh. Dept. of Biological and Agricultural Engineering.
R. W. Skaggs, E. J. Monke, and L. F. Huggins.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 16, No 1, p 85-88, 1973. 9 fig, 17 ref. OWRR A-021-IND (3).

Descriptors: *Hydraulic conductivity, *Infiltration, *Unsaturated flow, Porous media, Soil water content.
Identifiers: Gamma ray attenuation.

An approximate method for determining unsaturated hydraulic conductivity was based on the assumption that the conductivity-pressure head relationship could be effectively represented by an empirical 3-parameter equation by Gardner. The conductivity functions of two artificially packed soils were determined. Infiltration rate-time relationships were then measured for infiltration into soil columns having different initial water content distribution. These relationships were compared to influx curves predicted through the use of the determined K (h) functions, that is, the hydraulic conductivity-pressure head relationship. The K (h) functions obtained for the two soils experimentally investigated gave reliable predictions of the influx curves for different initial water content distribution. Further evidence of the validity of the K (h) functions was given by the close agreement between the predicted and measured wetting front movement for tests on dry soils. (Wiersma-Purdue)

REACTIVATING SOIL RIPPING TREATMENTS FOR RUNOFF AND EROSION CONTROL IN THE SOUTHWESTERN U.S.,
Forest Service (USDA), Albuquerque, N. Mex. Rocky Mountain Forest and Range Experiment Station.
E. F. Aldon.
Annals of Arid Zone, Vol 11, Nos 3 and 4, p 154-160, Sept. and Dec. 1972. 1 fig, 2 tab, 4 ref.

Descriptors: *Deep tillage, *Erosion control, *Soil treatment, *Soil management, Runoff, Percolation, Soil moisture, Moisture availability, Evapotranspiration, Precipitation(Atmospheric), Infiltration, Induced infiltration, Retention, Soil water, Storage capacity, Water storage, Soil-water-plant relationships, *Southwest U.S.
Identifiers: *Soil ripping.

The process of breaking up soil for increased moisture penetration is called soil ripping. It is an effective method for controlling erosion and runoff for 3 to 5 years in the southwestern United States. The re-ripping of soils which have been closed after an initial soil ripping treatment is an economical method of reducing runoff to two thirds the undisturbed level. This was as effective as ripping new areas and did not destroy the vegetation of the originally undisturbed area. Thus vegetation may be established in areas for long-term runoff control while interspersed areas are repeatedly ripped for immediate control. Indiscriminant ripping can encourage soil piping, so care must be taken when ripping shallow shale soils. (Muller-Arizona)

MINERALOGICAL COMPOSITION OF CLAYS IN SOIL PROFILES OF ISRAEL: I. THE SOILS OF THE MEDITERRANEAN ZONE,
Hebrew Univ., Rehovot (Israel). Dept. of Soil and Water Science.
M. Gal, S. Ravikovitch, and A. J. Amiel.
Hebrew University of Jerusalem, Faculty of Agriculture, Rehovot, Israel. October 1972. p 1-18. 6 fig, 2 tab, 31 ref.

Descriptors: *Clay minerals, *Soil profiles, *Montmorillonite, Cation exchange, Soil analysis, Bedrock, Aeolian soils, Calcite, Soil types, Alluvium.
Identifiers: *Israel, *Mediterranean zone.

Soil formation of the Mediterranean zone of Israel takes place under the influence of alternate wetting (short rainy winter) -- drying (long dry hot summer) cycles. Soil samples were taken from upland arid valley sites, and are grouped first by origin: the soils formed of bedrock, and those developed from alluvial and aeolian sediments from parent rocks outside the area of distribution of the soils. Soils in these groups are subdivided by the minerals found in their clays. Montmorillonite is the dominant mineral in the clay fraction of two soil groups. The third group contains an appreciable amount of calcite in its clay. Cation exchange capacity is highest in the group of soils where montmorillonite accounts for more than two thirds of the minerals. (See also W74-07100) (Ferreira-Arizona)
W74-07099

MINERALOGICAL COMPOSITION OF CLAYS IN SOIL PROFILES OF ISRAEL: II. THE SOILS OF THE DESERT ZONE,
Hebrew Univ., Rehovot (Israel). Dept. of Soil and Water Science.
S. Ravikovitch, M. Gal, and V. Cossman.
Hebrew University of Jerusalem, Faculty of Agriculture, Rehovot, Israel. October 1972. p 19-31. 4 fig, 2 tab, 12 ref.

Descriptors: *Soil analysis, *Soil profiles, *Montmorillonite, *Clay minerals, Illite, Kaolinite, Deserts, Cation exchange, Calcite, Aeolian soils, Bedrock, Gravels, Soil types.
Identifiers: *Israel.

From samples taken from areas with 200-300 mm annual precipitation, the soils of Israel's desert steppe regions were classified into three groups on the basis of the mineral composition of the clay fraction. The first group contains montmorillonite as the dominant mineral, with kaolinite and illite as main accessory minerals. Group 2 soils contain montmorillonite as the dominant mineral in the clay fraction, with calcite as the main accessory. Group 3 soils contain montmorillonite as the dominant mineral, accounting for between one-third and one-half of all the clay. The main accessory minerals are kaolinite and calcite. Soils of the third group are very common in the desert region. Cation exchange capacity of the clays ranges widely in desert soil. Soils formed from desert aeolian dust and alluvial sediments are compared with soils formed from bedrock and stony alluvium. (See also W74-07099) (Ferreira-Arizona)
W74-07100

MANGANESE AND IRON SOLUBILITY CHANGES AS A FACTOR IN TILE DRAIN CLOGGING: I. OBSERVATIONS DURING FLOODING AND DRYING,
Agricultural Research Service, Brawley, Calif. Imperial Valley Conservation Research Center.
L. R. Grass, A. J. MacKenzie, B. D. Meek, and W. F. Spencer.
Soil Sci Soc Am Proc. Vol 37, No 1, p 14-17. 1973, Illus.
Identifiers: Carbon, Clogging, Drying, Flooding, *Iron, Irrigation, *Manganese, Nitrates, Nitrogen, Redox, Salinity, Saturation, Soils, *Solubility, *Tile(Drains), Waterlogging, *California(Imperial Valley).

A field study of waterlogging and subsequent drying of the soil profile showed that under irrigation culture in Imperial Valley (California) reducing conditions became prevalent. Reducing conditions, as indicated by declining Eh (redox potential) values, became most favorable for dissolution of Mn and Fe near the soil surface. However, the concentrations of Mn2+ and Fe2+ were lowest near the surface, probably because of their leaching from this zone, and the shorter time of contact between soil solution and soil particles. The concentrations of Fe2+ and Mn2+ were higher in the deeper horizons of the soil profile. In the plow layer, the reducing intensity increased, beginning 9 m away from the tile and reaching a maximum 18-23 m from the tile drain. The Eh levels in the soil profile declined immediately after irrigation began and rose immediately after irrigation stopped indicating the importance of atmospheric O2 to the oxidation-reduction status and, therefore, to the solubility of Fe and Mn compounds. Soluble organic C apparently was not related to the concentration of Mn2+ or Fe2 in the soil solution even though the decomposition of soil organic matter is important in oxidation-reduction reactions in the soil profile. (See also W74-07152), Copyright 1973, Biological Abstracts, Inc.
W74-07151

MANGANESE AND IRON SOLUBILITY CHANGES AS A FACTOR IN TILE DRAIN CLOGGING: II. OBSERVATIONS DURING THE GROWTH OF COTTON,
Agricultural Research Service, Brawley, Calif. Imperial Valley Conservation Research Center.
L. B. Grass, A. J. MacKenzie, B. D. Meek, and W. F. Spencer.
Soil Sci Soc Am Proc. Vol 37, No 1, p 17-21, 1973, Illus.
Identifiers: Carbon, Clogging, Cotton, Drain clogs, Gossypium-Hirsutum, Growth, *Iron, Irrigation, *Manganese, Nitrates, Nitrogen, Redox, Salinity, Saturation, Soil, *Solubility, *Tile drains, Waterlogging, *California(Imperial Valley).

Various levels of oxidation-reduction develop in the soil profile during the irrigation and growing season of the cotton (Gossypium hirsutum L.) crop. Reducing intensity increased with depth during the growing season and reached maximum intensity at the 6.10-m depth. Reducing conditions favorable to increased solubility of Fe and Mn were observed in the surface horizons of the profile during most of the season. Changes in the solubility of Mn and Fe occurred with changes in the oxidation-reduction status in the soil profile. Mn began to dissolve at 400 m V and became significant at less than 300 m V. Increased concentration of nitrate retarded reduction of oxidized Fe and Mn compounds. The salinity of the soil solution affected the concentration of soluble Mn and Fe. The presence of NO3--N in the soil solution in amounts > 0.2 ppm retarded the dissolution of Mn compounds. The solubility of Mn and Fe can probably be controlled by controlling or regulating the oxidation-reduction status of the soil profile by reducing the waterlogging period after irrigation to a minimum. INTENSIVE INFILTROMETER STUDIES ON A PLOWED BIG SAGEBRUSH SITE,
Utah State Univ., Logan. Watershed Science Unit.
G. F. Gifford, and F. E. Busby.
Journal of Hydrology, Vol 21, No 1, p 81-90, January 1974. 3 fig, 5 tab, 3 ref.

Descriptors: *Infiltration, *Infiltrometers, *Idaho, *Grazing, Rainfall-runoff relationships, Sagebrush, *Range management, Evapotranspiration, Vegetation effects.
Identifiers: *Plowing.

Intensive infiltrometer studies were made over a 4-year period on a plowed big sagebrush (Artemisia tridentata) site in southern Idaho. There was a natural decay in absorptive capabilities of surface soils due to the plowing treatment. The apparent result of grazing was to eliminate seasonal trends so that infiltration rates were low throughout the year. Grazing did not increase sediment production potentials beyond the increases expected as a result of mechanical disturbance associated with

plowing. Easily measured soil cover characteristics do not adequately reflect the potential hydrologic performance of a big sagebrush site which has been grossly modified by activity such as plowing or grazing. (Knapp-USGS)

NUMERICAL STUDIES OF TWO-DIMENSIONAL SATURATED-UNSATURATED DRAINAGE MODELS,
Oslo Univ. (Norway). Inst. of Geophysics.
M. Todsen.
Journal of Hydrology, Vol 20, No 4, p 311-326, December 1973. 10 fig, 15 ref.

Descriptors: *Soil water movement, *Saturated flow, Drainage, *Numerical analysis, Mathematical models, *Seepage, Moisture tension, Specific retention.

The partial differential equation which governs the seepage of water in unsaturated and saturated porous media was solved numerically by a generalized Newton iteration technique for two models, one of ditch drainage and one of an earth dam model. For both two-dimensional models, a few hypothetical soils with different moisture retention curves were considered. In both models only drainage from an initially saturated soil occurs; thus, the problem of hysteresis is avoided. The results of the computations were compared with those of corresponding saturated (pure groundwater) models. Computational instability phenomena appear when the slope of the retention curves is made steep, (for poorly-graded soils). (Knapp-USGS)

WATER RETENTION OF GRANITIC SOILS IN THE IDAHO BATHOLITH,
Forest Service, (USDA), Ogden, Utah. Intermountain Forest and Range Experiment Station.
J. L. Clayton, and C. E. Jensen.
USDA Forest Service Research Paper INT-143, December 1973. 20 p, 8 fig, 6 tab, 17 ref, append.

Descriptors: *Soil moisture, *Moisture tension, *Organic matter, Moisture content, Soil texture, Forest soils, Soil-water-plant relationships, Clays, Particle size, Mathematical models, Forestry, Granites, Idaho.
Identifiers: *Moisture retention, *Idaho Batholith.

Volumetric soil-water retention was evaluated at 1/3 and 15 bars for its relation to the effects of organic matter, fines (<50 micrometer diameter) and soil bulk density. Samples were from soils formed from granitic parent materials of the Idaho Batholith. These soils are coarse-textured and have a broad range of organic matter content. Texture has only a secondary effect in the Batholith soils. In contrast, retention is strongly affected by organic matter, because of the broad organic matter range and the enhanced potential for organic matter to exert its retention effects. Organic matter alone explains 57% of the variance in water retention at 1/3 bar, and 62% at 15 bars tension. Incorporating the interacting effects of the remaining two variables explains an additional 17% of the variance in water retention at 1/3 bar, and an additional 11% at 15 bars. Tables and equations for the two retention models are presented. The final models were subsequently adjusted by least squares to two data sets of geographically diverse soils from the Idaho Batholith. The adjusted retention models operate well for predicting water retention at both energy levels. (Knapp-USGS)

ACTIVITY OF THE MICROORGANISMS AND THE MINERALIZATION OF THE ORGANIC MATTER PEAT SOILS WITH A VARYING LEVEL OF SUB SOIL WATERS, (IN RUSSIAN),
T. G. Zimenko.
Izv Akad Nauk SSSR Ser Biol. 6, p 846-854. Illus. 1972. English summary.
Identifiers: Amino acids, Enzymes, Microbial studies, *Microorganisms, *Mineralization, *Organic matter, *Peat soils, Respiration, Soils, Subsoil waters.

The group composition and activity of the microorganisms in peat soils depends on the level of subsoil waters. At a depth equal to 58-60 cm, unfavorable conditions of a hydroair regime are created in the soil leading to a suppression of the development of the microorganisms. Lowering of subsoil waters is followed by a progressive increase of the number and activity of microorganisms. This is immediately followed by an activation of the processes of soil respiration, accumulation of free amino acids and enzyme formation. The biological mineralization of peat is enhanced. The contents of the general organic matter, N and C are reduced.--Copyright 1973, Biological Abstracts, Inc.

APPLICATION OF THE SPLINE FUNCTION T SOIL SCIENCE,
California Univ., Davis.
K. T. Erh.
Soil Sci. Vol 114, No 5, p 333-338, 1972. Illus.
Identifiers: Diffusivity, Infiltration, Pressure, *Soil water, *Spline function, *Soil profiles, *Water storage, Hydraulic conductivity.

The most attractive feature of the spline functio approximation method is its capability of transfer ring an empirical and phenomenological relation ship into a definite mathematical formula. It is no a statistical method and bears no statistical sig nificance. Spline function approximation has bee tested extensively for its validity and results ob tained were satisfactory. Examples are presented in which the spline function approximation can b applied. Post-infiltration water pressure profiles were measured in the field. By applying the spline function approximation, the soil-water pressure and water-content profile were treated as a con tinuous and differentiable function of depth. Thus the water storage capacity, the hydraulic gradient and the soil-water flux in any time interval at any depth was readily evaluated. The unsaturated hydraulic conductivity values as well as those of the soil water diffusivity were easily estimated. The use of this approximation greatly simplifies attempts to solve a partial differential equation for nonlinear adsorption isotherm by numberical methods. An example is given for soil-water profiles for 2 periods of water infiltration into air-dry Sacramento clay. For estimating the soil-water diffusivity, the application of the spline function to describe the soil-moisture profile would remove any uncertainty in determining the slope. This approximation method is a logical and reasonable approach for those situations in which a statistical technique is not applicable. --Copyright 1973, Biological Abstracts, Inc.

PHOSPHORUS SUPPLY CHARACTERISTICS OF ACID ORGANIC SOILS AS MEASURED BY DESORPTION AND MINERALIZATION,
North Carolina State Univ., Raleigh.
Z. W. Daughtrey, J. W. Gilliam, and E. J. Kamprath.
Soil Sci. Vol 115, No 1, p 18-24, 1973. Illus.
Identifiers: Acid *Desorption, Fertilization, Measurement, *Mineralization, Nutrition, *Phosphorus, *Soils(Acid organic), *North Carolina(Tidewater region).

Sixteen soils ranging from poorly drained mineral soils high in organic matter in surface horizons to deep colloidal mucks were collected in the Tidewater region of North Carolina. Crops on the selected soils had previously shown a varied response to applied P. P was desorbed from the soils by 12 successive equilibrations with water. Mineralization of organic P during incubation was also measured. The soils were placed into 3 categories based on the desorption patterns and amount of P released during desorption. One group, composed of the poorly drained mineral soils, exhibited an increase in P desorbed with each successive extraction but the total amount desorbed was low. This group also had a relatively small amount of P mineralized. The second group, composed of muck soils and 2 intergrade soils, exhibited a decreasing amount of P released with successive equilibrations but the total amount of P released was large. The third group of soils, composed of reed bed and intergrade soils, had either an increasing amount of P released with successive extraction and a relatively high amount of P desorbed or a very high amount of P desorbed such that the pattern of release was insignificant. Most of the soils in the third group also had large amounts of organic P mineralized during incubation. The soils of the first group were relatively infertile with respect to P supply. The soils in the second group might supply adequate P initially, but could not continue to supply sufficient P and crops grown on these soils would probably

espond to P fertilization. Soils in the third group hould supply adequate P for plant growth hroughout the growing season. --Copyright 1973, Biological Abstracts, Inc.

THE HEAT FLUX DENSITY IN A NON-HOMOGENEOUS BARE LOESSIAL SOIL,
Israel Meteorological Service, Bet-Dagan. Div. of Agricultural Meteorology.
M. Fuchs, and A. Hadas.
Boundary-Layer Meterol. Vol 3, No 2, p 191-200, 1972. Illus.
Identifiers: Density, Diurnal, Energy exchange, *Heat flux, *Loessial soil, *Soil thermal properties.

The relationship between the diurnal patterns of the radiant energy exchange in the atmospheric surface layer and the soil heat flux density of a bare irrigated soil in an arid environment is described. The soil heat flux density is a large fraction of the net radiation. The soil moisture content has little effect on this fraction but modified the phase relationship between the net radiation and the soil heat flux density waves. Differences between the thermal regimes of the 'wet' and 'dry' soil appear to be caused by latent heat exchanges rather that changes of the soil thermal properties. The variation with depth of the soil thermal properties strongly influences the propagation of the temperature and heat flux density waves in the soil. A heat diffusion theory for non-homogeneous conductors(Lettau) which enables the thermal properties of the soil to be predicted is tested by comparison with experimental determinations in the field. --Copyright 1973, Biological Abstracts, Inc.

STRUCTURAL CHANGES IN TROPICAL SOILS DUE TO ANIONS IN IRRIGATION WATER,
Hawaii Univ., Honolulu.
S. A. El-Swaify.
Soil Sci. Vol 115, No 1, p 64-72, 1973. Illus.
Identifiers: *Anions, Bicarbonates, Cations, Chlorides, Hydraulic conductivity, *Irrigation water, Silicates, Soils, Sulfates, *Tropical soils, Hydrogen ion concentration.

The effects of chlorides, sulfates, bicarbonates, and silicates on the hydraulic conductivities of some tropical soils were investigated. The soils, an Oxisol, and Aridisol, an Inceptisol and a Vertisol, were selected so that a wide variety of mineralogical components would be represented. The soils also represent a range of charge dependence on pH and on the presence of specifically adsorbed ions. In their natural states, they exhibit from predominantly net negative (Vertisol) to net positive (Inceptisol) charges. Anion effects became increasingly important as the proportion of amorphous materials increased, as in the Inceptisol. Such effects were due primarily to the anio's ability to change the charge characteristics of the soil, either directly or indirectly, by changing the pH of the system; and secondarily, to their effects on cation activities. When the proportion of 2:1 clays increased, cation activity changes, reflected by changes in electrolyte concentration, produced more significant structural changes than did change in anion type. This was true in the Vertisol whose charges are but little dependent on the composition of soil solution. Structural changes in the Oxisol and Aridisol, both made up of kaolins and iron oxides, depended to varying degrees on both anion type and electrolyte concentration, the first being relatively more significant in lower horizons and the second in upper horizons. --Copyright 1973, Biological Abstracts, Inc.

MICRO-DETERMINATION OF CATION-EXCHANGE CAPACITY BY NEUTRON ACTIVATION ANALYSIS,
Oregon Agricultural Experiment Station, Corvallis.
M. J. Dudas.
Soil Science Society of America Proceedings, Vol 37, No 5, p 804-805, September-October, 1973. 1 fig, 2 tab, 4 ref.

Descriptors: *Cation exchange, *Gamma rays, *Clays, Kaolinite, Montmorillonite, *Neutron activation analysis.

Neutron activation analysis was evaluated as a method to determine the cation-exchange capacity (CEC) of clay samples. Cation-exchange capacity values of satisfactory reproducibility and accuracy were obtained on 5- to 50-mg subsamples of a kaolinite and montmorillonite clays previously saturated with Na, Rb, or Cs. Use of Cs as the index ion provided the simplest and most flexible conditions for the activation analysis method. (Skogerboe-Colorado State)

Pochvovedeniye, No 4, p 59-64, April 1973. 5 tab, 2 ref.

Descriptors: *Soil physics, *Soil water movement, *Soil moisture, *Variability, *Field crops, Potatoes, Barley, Grasses, Statistical methods, Probability.
Identifiers: *USSR, Peas.

Variations in soil moisture of the O-30-cm layer caused by crops were studied in a test plot of the Kostroma Agricultural Institute 'Karavayevo' in 1963-66. Reliable differences in soil moisture contents under potatoes, peas, and barley were determined by statistical analysis. Necessary replication of soil moisture determinations was calculated to ensure an accuracy within 10% of the determined value for different fiducial probabilities (0.80, 0.90, and 0.95). Field crops were found to have a significant effect on soil moisture content and its variations. Differences in soil moisture content at depths of 0-10, 10-20, and 20-30 cm were greater under potatoes than under peas and barley. The degree of variation and the determination error in soil moisture content increased as the soil dried and reached maximum values under peas, barley, and perennial grasses. An 8-fold replication of soil sampling at depths of 0-10 and 10-20 cm ensured an average determination accuracy within 3.1-7.2%, and a 4-fold replication at a depth of 20-30 cm, an accuracy within 6.2-7.0%. In most cases an 8-fold replication of soil moisture determinations at depths of 0-10 and 10-20 cm under all crops ensured an accuracy within 10% of the determined value for a fiducial probability of 0.90 and 0.95. A 4-fold replication of soil moisture determinations at a depth of 20-30 cm made it possible to obtain an accuracy within 10% of the determined value for a fiducial probability of 0.80. (Josefson-USGS)

FLUX-GRADIENT RELATIONSHIPS AND SOIL-WATER DIFFUSIVITY FROM CURVES OF WATER CONTENT VERSUS TIME,
Purdue Univ., Lafayette, Ind. Dept. of Agronomy.

D. L. Nofziger, L. R. Ahuja, and D. Swartzendruber.
Soil Science Society of America Proceedings, Vol 38, No 1, p 17-23, January-February 1974. 6 fig, 11 ref. OWRR B-014-IND(6).

Descriptors: *Soil water movement, *Unsaturated flow, Seepage, Percolation, Equations, Wetting, *Diffusivity, Diffusion.

Direct analysis of a family of curves of soil-water content versus time at different fixed positions enables assessment of the flux-gradient relationship prior to the calculation of soil-water diffusivity. The method was evaluated on both smooth and random-error data generated from the solution of the horizontal soil-water intake problem with a known diffusivity function. Interpolation, differentiation, and integration were carried out by least-squares curve fitting based on the two recently developed techniques of parabolic splines and sliding parabolas. Results were excellent for both smooth and random-error input data, whether in terms of recovering the original known diffusivity function, assessing the nature of the flux-gradient relationship, or in making the numerous checks and validations at various intermediate stages of computation. The method applies for any horizontal soil-wetting process independently of the specific boundary conditions, including water entry through a nonzero inlet resistance. It should be adaptable to horizontal dewatering, and extendable to vertical flow. (Knapp-USGS)

SEEPAGE THROUGH A HILLSIDE: THE STEADY WATER TABLE,
Arizona Univ., Tucson. Dept. of Soils, Water, and Engineering.
A. W. Warrick, and D. O. Lomen.
Water Resources Research, Vol 10, No 2, p 279-283, April 1974. 3 fig, 1 tab, 12 ref.

Descriptors: *Seepage, *Groundwater movement, *Water table, Mathematical studies, Slopes, Topography, Hydraulic conductivity.

An analytical solution is given for seepage through a hillside in which a curved water table is maintained by steady percolating water. The two-dimensional surface is assumed to be a straight slope from the base to a seepage point but may be irregular at higher elevations. Conformal transformations determine seepage elevations and water table profiles as a function of the seepage rate and the slope. For small slopes and small percolation rates the seepage elevation is equal to the rainfall rate times the width of the slope divided by the saturated hydraulic conductivity. (Knapp-USGS)

SALT DISPLACEMENT INTO DRAIN TILES UNDER PONDED LEACHING,
Arizona Univ., Tucson. Dept. of Soils, Water, and Engineering.
S. Miyamoto, and A. W. Warrick.
Water Resources Research, Vol 10, No 2, p 275-278, April 1974. 6 fig, 1 tab, 7 ref.

Descriptors: *Leaching, *Soil water movement, *Tile drainage, Infiltration, Mathematical models, Saturated flow, Saline water, Path of pollutants.

Steady state piston-type displacement into drain tiles when the ground surface is partially covered by an impermeable material or by ponded water away from the drains was analyzed mathematically. By preventing the water from infiltrating directly over the drains a more uniform leaching pattern is attained. The result is to reduce the water required for leaching to the depth of drains by as much as one half. Experimental data obtained from sand tank models support this prediction. (Knapp-USGS)

Descriptors: *Lakes, *Water level fluctuation *Water balance, Inflow, Evaporation, Runof Water loss, Water utilization, Withdrawal, Irrig tion, Deltas.
Identifiers: *USSR(Aral Sea).

Water balance of the Aral Sea was investigated f a 45-year period (1926-70). Long-term fluctuatio in sea level reflect both natural fluctuations in th discharge of its contributing rivers and, to an eve increasing degree, economic activity in the basi An increase in water withdrawals for irrigation i the sea basin in the 1950's had no effect on th level of the sea in view of the increased wat discharges during this period. An intense decline i the Aral Sea level, which began in 1961 and co tinues to the present day, is due primarily to large water withdrawals in the Syrdar'ya and Amu dar'ya basins. The level of the sea and the range o its long-term fluctuations depend on fluctuation in the annual amount of evaporation which varie to a greater degree than variability of annual ru noff of rivers flowing into the sea. Runoff losses i the Amudar'ya and Syrdar'ya deltas are directl dependent on amount of inflow to the deltas an thus reduce the range of level fluctuations of th sea. The subsurface component of the sea's wate balance is small and has little effect on the sea' level fluctuations. (Josefson-USGS)

. P. Smith.
vailable from the National Technical Informa-n Service as PB-231 785 $14.50 in paper copy, .45 in microfiche. Ph.D. Thesis, 1972, 205 p, 102 , 2 tab, 44 ref. OWRR B-009-WIS(7) 14-01-0001-57.

escriptors: *Lake Superior, Lakes, *Mixing, Vater Circulation, *Stratification, Movement, inds, Bathythermographs, *Water Temperature, Vater Currents, Coriolis forces, Model studies.
entifiers: Keweenaw Peninsula, Isle Royale.

ake Superior current and temperature data col-cted during the summer of 1966 and 1967 are mbined to provide a description of the summer rculation and temperature structure. Data are rgely from the central part of the lake, between e Keweenaw Peninsula and Isle Royale. Circula-n and temperature patterns appear to be closely terrelated. Infrared surface temperature patterns om eight flights between July 7 and October 1, 66, trace the formation of the epilimnion and in-cate nearshore packing of surface isotherms ong the southern shore of the lake in early mmer. Bathythermograph temperature cross-ctions from five cruises during the summer of 67 indicate sharply sloping isothermal surfaces rth of the Keweenaw Peninsula in early summer d a well defined thermocline established by rly August. The dynamic height method is used compute the corresponding geostrophic cur-nts. Early summer speeds are as high as 40 n/sec in an easterly, nearshore current. Mea-red currents from two buoy stations moored just rth of the Keweenaw Peninsula in 1966 are milar in speed and direction, suggesting that the rly summer current is primarily baroclinic in na-re. Nearshore and mid-lake temperature corder data from both 1966 and 1967 indicate pid warming in the upper 20 to 25 meters once e water column has reached the temperature of aximum density. Progressive vectors and vector equency diagrams indicate that current speeds crease in early August. The average computed ow is 22,210 m3/sec. Energy density spectra in-cate that inertial motion is a major component of e current at locations from shore.

he gut content of rainbow trout (Salmo gaird-eri), kokanee (Oncorhynchus nerka), and 2 sala-anders (Ambystoma gracile and Taricha granu-osa) from Marion Lake, British Columbia, anada, were compared. The species found in ese 4 predators were very similar but each redator concentrated on different prey. The okanee concentrated on species present at the urface or in the water column, and the trout on rger benthos. The salamanders also fed on enthos but usually chose smaller size classes. In omparing the effect of the 4 predators, the verage volume of food present by weight in the gut was multiplied by a proportional converter for the rate of passage through the gut, the mean meal size, and by the number of individuals in the population. The results suggested that S. gairdneri ate over half by weight (56%) of all the food taken by the 4 predators combined; kokanee and A. gracile were less important and consumed 25% and 19%, respectively; and T. granulosa because of its low number and slow growth was unimportant (1%). -- Copyright 1973, Biological Abstracts, Inc.

SURFACE TEMPERATURES OF LAKE ERIE,
Atmospheric Environment Service, Downsview (Ontario).
M. S. Webb.
Water Resources Research, Vol 10, No 2, p 199-210, April 1974. 18 fig, 1 tab, 19 ref.

Descriptors: *Water temperature, *Lake Erie, Air temperature, Limnology, *Remote sensing, Surveys, Solar radiation, Seasonal, Great Lakes, *Mapping.
Identifiers: *Radiometers.

The spatial patterns of the mean surface temperature of Lake Erie were mapped by data from 58 airborne radiation thermometer surveys obtained over a 6-year period. The lakes southern location within the Great Lakes system and the large differences in water depth between its three basins are important controls affecting the surface temperature regime. Except in winter, when it is largely ice covered, the surface of Lake Erie is warmer than the surfaces of any of the other Great Lakes. Month-by-month relationship between the mean surface temperature and the mean air temperature is domonstrated. (Knapp-USGS)

THE ESTIMATION OF VERTICAL EDDY DIFFUSIVITIES BELOW THE THERMOCLINE IN LAKES,
California Univ., Davis. Dept. of Physics.
T. Powell, and A. Jassby.
Water Resources Research, Vol 10, No 2, p 191-198, April 1974. 4 fig, 4 tab, 44 ref. Rockefeller Grant 3-440405-57151-2 NSF Grant GA-34099.

Descriptors: *Limnology, *Thermocline, *Mixing, *Diffusivity, *Turbulence, Dispersion, Diffusion, Mass transfer, Heat transfer, Convection, Advection, Water temperature, Density currents, Path of pollutants, Energy budget.

Methods of estimating vertical eddy diffusivity coefficients in lakes for such substances as temperature, inorganic ions, or biologically active materials are briefly reviewed. One widely used method, and McEwan method, is discussed, and it is shown how this method can lead to erroneous results. Another method, the flux gradient method, is examined and compared with the McEwan method in specific case studies of thermal energy transfers. Lack of agreement between values obtained by the McEwan method and the flux gradient method has led some investigators to postulate a flux of thermal energy into the deep layers of a lake by density currents. An alternative explanation of the discrepancy is that deepwater turbulent mixing may result from a microstructure of layers and sheets caused by, for example, a Kelvin-Helmholtz shear instability in the flows or other instability mechanisms. (Knapp-USGS)

INSTABILITY OF WATER COOLED FROM ABOVE,
Purdue Univ., Lafayette, Ind. School of Mechanical Engineering.
D. M. Snider, and R. Viskanta.
Paper presented at First World Congress on Water Resources, Chicago, Illinois, September 24-28, 1973. 12 p, 6 fig, 12 ref. OWRR A-029-IND(4).

Descriptors: *Thermal properties, *Thermal stratification, *Thermoline, *Convection, *Conduction, *Evaporation, Heat transfer, Energy transfer, Thermal radiation, Infrared radiation, Interferometry.
Identifiers: Mach-Zehnder interferometer.

The temperature field and convection currents induced in water by convection, evaporation and radiation cooling of its surface are studied. These phenomena occur naturally and continuously in any lake, pond, reservoir or a river but they remain usually unobserved. Mach-Zehnder interferograms taken from the side of a tank of water were used to measure the temperature distribution and to study the convective currents induced by cooling from the surface. Experiments were performed with initially uniform and thermally-stratified layers of water. Both qualitative and quantitative results of preliminary nature for temperature distribution are presented. Interferograms vividly reveal mixing motions induced by instabilities arising in the surface layer. The onset of manifest convective behavior was determined by visual observations of interferograms.

A STUDY OF THE COMMUNITIES OF INVERTEBRATES OF PLANTS OF LAKE CHAD: PRELIMINARY INQUIRES, (IN FRENCH),
Office de la Recherche Scientifique et Technique Outre-Mer, Fort-Lamy (Chad).
C. Dejoux, and L. Saint-Jean.
Cah ORSTOM Ser Hydrobiol. Vol 6, No 1, p 67-83. 1972, Illus, (English summary).
Identifiers: Ceratophyllum, *Chad(Lake Chad), Cladocera, Copepoda, *Invertebrates, Lakes, Potamogeton, *Aquatic plants.

A new apparatus was used to collect plant samples from a constant volume. A method is proposed to estimate variations of vegetal biomass of a weed. The horizontal distribution in invertebrates looks like a binomial distribution, the first approximation. The organisms are distributed in aggregates. In the eastern part of lake Chad, the vertical variations which occur in the distribution of invertebrates populations in water plants are such that superficial samples could be considered as representative. The fauna sheltered by aquatic

plants is original in regard to the benthic or pelagic fauna. The places inside Potamogeton or Ceratophyllum weeds which are free of vegetation show the same planktonic forms (Copepoda and Cladocera) as the adjacent pelagic area, sensu stricto. All ecological study which includes cyclic factors must be followed in the same weed or located in the same area of a large weed.--Copyright 1973, Biological Abstracts, Inc.

Identifiers: Bottom deposits, *Chironomidae, Chironomus-Plumosus, *Diptera, *Japan(Lake Suwa), Larvae, Spaniotoma-Akamusi, *Vertical imigration, Standing crops.

The burrowing behavior of S. akamusi larvae tends to isolate them from other benthic animals, especially Chironomus plumosus larvae. Consequently, C. plumosus larvae do not compete with S. akamusi for food, and they therefore grow rapidly, resulting in a high annual maximum standing crop (about 2000 individuals/m2 in June, 1969).--Copyright 1973, Biological Abstracts, Inc.

Identifiers: Camellanus-Ctenopomae, Clarias-Senegalensis, Ctenopoma-Kingsleyae, *Fish parasites, *Nematodes, Procamallanus-Laeviconchus, Procamallanus-Senegalensis, Quimperia-Lanceolata, *Senegal(Sangalkam marsh), *Marshes.

Sangalkam is a freshwater marsh region 36 km northeast of Dakar, where perennial water leads to luxuriant vegetation. Procamallanus laeviconchus and P. senegalensis occur in Clarias senegalensis; Camellanus ctenopomae and Quimperia lanceolata in Ctenopoma kingsleyae. The life cycles of the Camellanidae include a copepoid intermediate host; that of Q. lanceolata is incompletely known. Laboratory studies indicate that development is sometimes direct or sometimes involves an intermediate host which may be a fish or an insect.--Copyright 1973, Biological Abstracts, Inc.

ANNOTATED CHECKLIST AND HOST INDEX FOR ARIZONA WOOD-ROTTING FUNGI,
Arizona Univ., Tucson.
R. L. Gilbertson, K. J. Martin, and J. P. Lindsey.
Agricultural Experiment Station, University of Arizona, Tucson, Technical Bulletin 209, February 1974. 48 p, 9 ref.

Descriptors: *Rots, *Pathogenic fungi, *Fungi, *Plant diseases, Trees, Forests, *Arizona, Vascular tissues, Brush.
Identifiers: *Wood-rotting fungi.

The wide variety of ecological zones, from hot deserts to alpine tundra, has given Arizona a rich flora of woody plants that provide a potential substratum for wood-rotting fungi. Although annual rainfall is relatively low in most areas of the state, much of it falls in the summer monsoon season during which conditions are favorable for fungal growth. A total of 385 species of wood-rotting fungi which have been identified in Arizona are catalogued by order, family, genus and species. Their general environment and associated fauna are also identified. A list includes the species of host on which each was found and the Arizona county in which the find was made. An index of 117 wood-rotting fungi hosts is presented with a list of fungi which attack the hosts and the nature of the rot which develops. (Muller-Arizona)

PRODUCTIVITY AND WATER STRESS CACTI,
Arizona State Univ., Tempe
D. T. Patten, and R. A. Nisbet.
Desert Biome, U.S. International Biological Pr gram, Research Memorandum, RM 73-11, 19 Progress Report, May 1973. 18 p, 8 fig, 3 tab, 5 re

Descriptors: *Productivity, *Adaptation, *Cac *Moisture stress, *Biomass, Dehydratio Drought resistance, Drought tolerance, Regim Photosynthesis, Regressive analysis, Dese plants, Carbon dioxide, Solar radiation, Temper ture, Moisture content, Growth rates, Southwe U.S., Mexico.
Identifiers: *Sonoran Desert.

Temperature and moisture primarily affect t production of biomass in prickly pear cac (Opuntia phaeacantha var. discata). Buckho cholla (Opuntia acanthocarpa) was also studied f comparison purposes. Measurements of all plan were taken in situ, and included growth rate, and soil temperature, rainfall, plant temperatur carbon dioxide, and water rates. Evidence show that for cacti, optimum photosynthetic rates occ during the cool season or at cooler temperature Most new biomass accumulation occurs in wint prior to new pod and bud formation. Wint growth rates can appear to be offset by dehydr tion during abnormal drought periods; however, reduced dehydration rate is an indicator biomass accumulation. Prickly pear cacti appear t have a higher productivity potential than buckhor cholla, but the latter appears to be better adapte to higher temperatures. Prickly pear also appear to conserve water better although both are we able to survive drought conditions of the Sonora Desert. (Mastic-Arizona)

DISTILLATION-CONDENSATION OF WATE AND NUTRIENT MOVEMENT IN A DESERT ECOSYSTEM,
Nevada Univ., Reno. Desert Research Inst.
N. Stark.
Desert Biome, U.S. International Biological Pro gram, Research Memorandum, RM 73-44, 197 Progress Report, May 1973. 24 p, 9 tab, 17 ref.

Descriptors: *Distillation, *Condensation *Nutrients, *Desert plants, *Soil-water-plant rela tionships, Infiltration, Canopy, Root systems, Shrubs, Cation exchange, Throughfall, Stemflow, Litter, Moisture content, Growth rates, Permea bility, Leachate, Elements(Chemical), Ecosystems, Organic matter, Soils, Soil chemis try, Hydrogen ion concentration.
Identifiers: Water-holding capacity, Seedlings, Microwatershed, Mojave Desert, *Death Valley, Bursage, Creosotebush, Saltbush.

The importance of distillation-condensation in the soil as a water and nutrient source for desert plants was studied. The study concentrated on Larrea divaricata, Franseria dumosa, and Atriplex con fertifolia vegetation on rocky, gravelly soils in Death Valley. Soils immediately beneath shrubs displayed a higher permeability than soils of shrub

interspaces, despite a raised mound of soil at the base of each shrub. It is hypothesized that in addition to throughfall and stemflow, water supply is enhanced by microwatershed attributes of the surrounding soil surfaces. Variation in soil chemistry beneath the three species of shrubs is derived from pH values, water-holding capacity, cation exchange capacity, and elemental content. The data suggest that the plant roots modify their immediate chemical environment to increase nutrient concentrations and decrease potential toxicities. Methodology was inadequate to measure the quantity or quality of condensation water. (Mastic-Arizona)

EXTRUDED PEAT CYLINDERS: THEIR PHYSICAL CHARACTERISTICS AS AFFECTING TREE SEEDLING GROWTH AND GREENHOUSE DROUGHT TOLERANCE,
Research Council of Alberta, Edmonton.
D. L. Mitchell, D. Hocking, and W. C. Kay.
Can J For Res. Vol 2, No 4, p 479-486, 1972. Illus.
Identifiers: Absorption, Densities, *Drought tolerance, Greenhouse, Growth, Moisture, *Peat cylinders, *Pinus-contorta-var-latifolia, *Tree seedlings.

Seedlings (Pinus contorta Dougl. var. latifolia Engelm.) were grown in containers formed by extruding a peatwater mixture into flexible plastic tubing. The reduction in particle size of the peat that occurs during extrusion improved the rate of moisture absorption and decreased the rate of moisture loss. A range of peat densities of extruded peat cylinders (sausages) was prepared through control of the water content in the feed mixtures. Seedlings grown in sausages show decreased growth as the peat density is increased. Compared to rigid tubes filled with loose peat, seedlings in sausages are less subject to drought.--Copyright 1973, Biological Abstracts, Inc.

THE PAST AND PRESENT FLORA AND VEGETATION OF THE HACKENSACK MEADOWS,
W. S. Sipple.
Bartonia. 41, p 4-56. 1971/1972.
Identifiers: Aerial photography, Destruction, *Flora, Forest habitat, Marshes, *Meadows, *New Jersey(Hackensack meadows), *Mapping, Ruderal, Sea, *Vegetation.

The Hackensack Meadows is located in the Triassic lowlands, a subdivision of the Piedmont Province in NE New Jersey. Most areas are less than 5 ft above sea level. Field work was done in the study area during Sept. 1969. Data were then correlated with patterns of apparent vegetation types appearing on aerial photographs taken in June 1969. Additional field work was done in spring and summer, 1970 to corroborate vegetation types and verify the mapping. Older publications were consulted, and herbarium specimens checked to reconstruct the vegetation. Nineteen vegetation types are described and grouped into the general categories: marshes, forested areas, meadows and ruderal plants. Using data from the literature, including pollen analysis, the vegetation is described from post-Wisconsinan glacial time to the present, with separate descriptions for 1819, 1889, 1919, 1949 and 1969. The major factors causing vegetation in recent times are the constant rise of sea level and the diking of various bog areas and many related effects from advancing civilization such as lumbering, water table subsidence, fire and the neglect of older dikes which restored some of the earlier tidal influence to some areas.--Copyright 1973, Biological Abstracts, Inc.

PHENOLOGY OF A TROPICAL RAIN FOREST IN MALAYA,
L. Medway.
Biol J Linn Soc. Vol 4, No 2, p 117-146. 1972. Illus.
Identifiers: Flowering, *Forests, Fruiting, *Malaya, Malaysia, *Phenology, *Rain forests, Seasonality, *Tropical rains.

During 1960-1969, observations were made of flowering, fruiting, and foliar activity of 61 canopy trees (representing 45 spp.) in a largely undisturbed tract of Hill Dipterocarp Forest (Malaysia). Rainfall was measured by an accumulating gauge and, at a nearby station, the number of rainy days recorded. Annually recurrent floral cycles were displayed by only 10 spp. In these and in 11 additional species, foliar cycles were also circannual. Gregarious flowering, apparently in response to drought, occurred in many species in 1963 and 1968. In other years, interspecific differences in periodicity maintained a minimal incidence of flowering at 44%, and fruiting at 27% of species in the sample. Despite specific variations in phenology, the community as a whole exhibited regular seasonality, with single annual peaks of flowering and fruiting and a double peak of leaf production.--Copyright 1973, Biological Abstracts, Inc.

SHORT-TERM RESPONSE IN UNGULATE NUMBERS TO RAINFALL IN THE NOSSOB RIVER OF THE KALAHARI GEMSBOK NATIONAL PARK,
Pretoria Univ. (South Africa). Dept. of Zoology.
J. Du P. Bothma.
Koedoe. 15 p 127-133, 1972. Illus.
Identifiers: Blue wildebeest, Gemsbok, *Grazing animals, Red hartebeest, National parks, Nossob River, Rainfall, Springbok, *Ungulate, Vegetation, Wildebeest, *South Africa(Kalahari Gemsbok National Park).

The ungulate fauna of the Kalahari Gemsbok National Park (South Africa), an area without permanent water, must adapt their movements rapidly to changing vegetation patterns after a good rainfall. Four ungulates, the gemsbok, springbok, red hartebeest and blue wildebeest were observed in the Nossob River bed area from 3 mo. following the onset of the 1972 summer rains. The springbok and red hartebeest moved into the area in increased numbers as grazing conditions improved. Gemsbok waited until the vegetation was tall enough to be utilized. Blue wildebeest numbers declined, despite improved grazing conditions; however, this might have been due to the start of their annual east-west movement during the winter months following the rains.--Copyright 1973, Biological Abstracts, Inc.

TAXONOMIC COMPOSITION OF AQUATIC INVERTEBRATES OF THE DON BASIN IN COMPARISON WITH FAUNA OF THE OTHER RIVERS OF THE BLACK SEA CASPIAN BASIN, (IN RUSSIAN),
T. V. Sklyarova.
Zap Voronezh S-Kn Inst. 47 p, 198-204. 1972.
Identifiers: Aquatic animals, Black Sea, Caspian Sea, Ecological studies, Fauna, *Invertebrates, Rivers, *Taxonomic studies, *USSR(Don basin).

In the Don basin (USSR) 1072 taxa of invertebrates were recorded. Owing to the diversity of ecological conditions, the Upper Don has more than double the number of species in comparison with the Lower Don. With respect to the character of the aquatic fauna among rivers of the Black Sea-Caspian basin the Don is most similar to the Dnepr and then to the Volga, which belong, just as the Don, to plains rivers. The similarity between the fauna of the Don and Dnestr is manifested to a lesser degree, since the Dnestr is a river with a mountainous catchment area and has different ecological conditions.--Copyright 1973, Biological Abstracts, Inc.
W74-07537

STRUCTURE OF FISH GROUPINGS IN THE RIVERS AND STREAMS OF THE RIVER NIDA DRAINAGE BASIN,
Lodz Univ. (Poland). Faculty of Biology and Earth Sciences.
T. Penczak.
Ekol Pol. Vol 20, No 26, p 327-344. 1972, Illus.
Identifiers: Drainage basins, *Poland(River Nida), Rivers, Streams, Suckers, *Fish species.

A collection of 16,005 fish and suckers collected at 117 fishing sites from the River Nida (Poland) drainage basin was arranged with the help of cenological methods. Similar river zones were distinguished on the basis of dominating and other fish species. These zones are different from the zones or reaches distinguished on the basis of river fall or on other morphological elements used to characterize the rivers and streams. The problems of combined or separated occurrence of fish species and the degree of their ecological relations were also investigated. An attempt was made to distinguish the characteristic, transistory and eurytopic fish species in the studied area.--Copyright 1973, Biological Abstracts, Inc.

PRELIMINARY DIAGNOSIS OF A NEW SPECIES OF MARINE ISOPOD FROM STEWART ISLAND,
Oceanographic Inst. (New Zealand). Department of Scientific and Industrial Research, Wellington.
K. P. Jansen.
New Zealand Journal of Marine and Freshwater Research, Vol 7, No 3, p 261-262, September 1973. 1 fig, 2 ref.

Descriptors: *Isopods, *Systematics, Marine animals, Speciation.
Identifiers: *Paravireia, *New Zealand(Stewart Island), Animal morphology.

Four isopod specimens were collected from bottom mud in shallow water in Paterson Inlet, Stewart Island, by the Zoology Department, Victoria University of Wellington, in June 1972. The isopods belong to the genus Paravireia Chilton, but morphological differences exclude them from Paravireia typicus Chilton 1925, from the Chatham Islands, the only previously described species in the genus. The present paper is to establish a valid specific name for a forthcoming ecological study

without the precipitate erection of a new major taxon. This species is distinguished from Paravireia typicus by the smoothly rounded profile of the pleotelson and by the produced apices and setal tufts of the epimers of pereonites 3 and 4. No other records of the species are known. (Mortland-Battelle)

STOMATAL MECHANICS,
Connecticut Agricultural Experiment Station, New Haven. Dept. of Ecology and Climatology.
D. E. Aylor, J.-Y. Parlange, and A. D. Krikorian.
Am J Bot. Vol 60, No 2, p 163-171, 1973. Illus.
Identifiers: *Stomatal studies, *Turgor, Model studies, *Plant cell models.

A model of stomatal movement due to changes in turgor is presented which systematically illustrates the role of certain anatomical features. During the expansion of paired guard cells, there are 2 physical constrainst that cause the guard cells to bend and thus open the stomatal pore. The radial orientation of the micellae is shown to be the crucial feature which directly transmits the movement of the dorsal wall of the polar and central section to the stomatal slit. Furthermore, it is necessary that either the overall length of the entire stomatal apparatus or length of the common wall between the polar segments of the guard cells be constrained during the expansion of the guard cells. The model also shows that asymmetrically thickened guard cell walls are not necessary to cause bending of the guard cell. The ideas set forth in the model are consistent with the opening movements of both elliptical and grass-type stomata.--Copyright 1973, Biological Abstracts, Inc.

SAND DUNE RECLAMATION IN IRAQ -- PRESENT STATUS AND FUTURE PROSPECTS,
Institute for Applied Research on Natural Resources, Baghdad (Iraq).
J. Dougrameji, and R. N. Kaul.
Annals of Arid Zone, Vol 11, Nos 3 and 4, p 133-144, Sept. and Dec. 1972. 4 fig, 4 tab, 6 ref.

Descriptors: *Wind erosion, *Soil stabilization, *Windbreaks, *Dune sands, *Erosion control, Arid lands, Grazing, Soil treatment, Soil erosion, *Vegetation establishment, Vegetation regrowth, Droughts, Slope stabilization, Sands, Clays, Dry farming, Land reclamation, Mechanical control, Brush.
Identifiers: *Iraq.

Principal causes of shifting dunes over large areas of Iraq are drought, exploitation of natural vegetation, improper agricultural practices including overgrazing by livestock, and poor canal dredging operations. Extended rainless periods have prompted building of windbreaks near cultivated fields to cut down on erosion which, together with attempts at establishment of both native and introduced vegetation, will provide a beginning pattern for dune stabilization. Research has supplied information on soil physical factors, vegetation species best suited to the needs, and preliminary effects of mechanical barriers, the most successful of which is placement of brush barriers on the windward side of the dune in parallel lines oriented across the prevailing wind direction. This procedure is more efficient for inland dunes such as those in India and Iraq than the bituminous sprays used for coastal dunes in Libya, Morocco, and Tunisia. Also described are methods for seeding and transplantation. (Muller-Arizona)

BASIN PLAINS IN THE EASTERN MEDITERRANEAN: SIGNIFICANCE IN INTERPRETING ANCIENT MARINE DEPOSITS: 1. BASIN DEPTH AND CONFIGURATION,
Smithsonian Institution, Washington, D.C. Div. of Sedimentology.
D. J. Stanley.
Marine Geology, Vol 15, No 5, p 295-307, December 1973. 5 fig, 1 tab, 28 ref. Smithsonian Grant 430035.

Descriptors: *Bottom sediments, *Turbidity currents, Stratigraphy, Sediment transport, Deposition(Sediments).
Identifiers: *Mediterranean(Eastern basin), Flysch.

Basins in the eastern Mediterranean, and particularly those associated with the Hellenic Arc, accumulate rhythmically stratified deposits which resemble flysch formations. The eastern Mediterranean basin plains, except those off the Nile Cone, are bounded by slopes that exceed 3 deg and in some cases 40 deg; the topographic characteristics and distribution of these basins reflect the intense structural activity in this region. Depths in the Aegean Sea range from less than 200 to over 2500 m (basin plain area ranges from 10-1,380 sq km); plains in the Sea of Crete are less elongate than those in other provinces. Depressions south of the Peloponnesus-Crete-Rhodes island arc include a number of long, very narrow (1-3 km wide) trenches that are generally small (25-200 sq km) and deep (> 3000 m). The largest depressions, the Herodotus and Sirte abyssal plains, south of the Mediterranean Ridge also exceed 3000 m. Although most basins occur at depths exceeding 1000 m, there are excellent examples of shallower (< 3000 m) turbidite sand and mud sequences in basins and base-of-slope environments in the Aegean. Vertical tectonic movement locally exceeds rates of sediment accumulation resulting in structural lowering of deposits into deeper water. (Knapp-USGS)

DEPOSITIONAL FEATURES OF BRAIDED-MEANDERING STREAM,
Oklahoma State Univ., Stillwater. Dept. of Geology.
J. W. Shelton, and R. L. Noble.
American Association of Petroleum Geologists Bulletin, Vol 58, No 4, p 742-749, April 1974. 5 fig, 1 tab, 40 ref.

Descriptors: *Sedimentary structures, *Braiding, *meanders, Alluvial channels, *Oklahoma, Channel morphology, Sediment sorting, Stratigraphy, Discharge(Water), Sand bars, Sedimentology.
Identifiers: *Cimarron River(Okla).

The Cimarron River in north-central Oklahoma shows characteristics intermediate between typical braided and meandering streams. The gradient is 1.8 ft per mi; the sinuosity is 1.5; and average channel depth at bankfull stage is 15 ft. Accretion ridges on the downstream sides of bars characterize the straighter reaches, whereas accretion ridges on both the upstream and downstream sides are in the more sinuous reaches. The deposits show upward fining; they are generally fine- to medium-grained, well-sorted sand, with scattered pebbles. Horizontal bedding and medium-scale and small-scale crossbedding are the dominant sedimentary structures. Compared to typical meandering-stream deposits, the Cimarron River deposits are thinner but wider, and they contain less fine-grained clastics in the upper part of the sequence and as clay interbeds. The Cimarron sediments are finer grained and better sorted than sands of typical braided streams. They contain more horizontal bedding than either braided- or meandering-stream deposits. The type of sand deposit represented by the Cimarron River sand may be similar to certain ancient alluvial sandstones which were deposited during either basinal subsidence or eustatic rise in sea level. LINE INTERSECTION METHOD FOR ESTIMATING DRAINAGE DENSITY,
British Columbia Univ., Vancouver. Dept. of Geography.
D. M. Mark.
Geology, Vol 2, No 5, p 235-236, May 1974. 1 fig, 1 tab, 3 ref.

Descriptors: *Drainage density, *Maps, *Terrain analysis, *Drainage patterns(Geologic), Geomorphology, Methodology, Estimating.
Identifiers: *Line intersection method.

The line intersection method for estimating drainage density using maps involves counting the number of intersections with the drainage net per unit length of sample traverse line and multiplying the result by a correction coefficient. Theoretical and empirical evidence indicates that this coefficient should be 1.571. (Knapp-USGS)
W74-07174

SAND-WAVE FIELDS IN TAIWAN STRAIT,
Oregon Univ., Eugene. Dept. of Geology.
S. Boggs, Jr.
Geology, Vol 2, No 5, p 251-253, May 1974. 2 fig, 10 ref.

Descriptors: *Sand waves, *Bottom sediments, *Sediment transport, Sedimentary structures, Currents(Water), Ocean currents, Particle size, Tides.
Identifiers: *Taiwan Strait.

Sand waves were detected by echo sounding in several areas of the shallow shelf northwest and west of Taiwan. They occur in fields 5 to 30 km in width, at water depths ranging from 20 to 90 m. The height of the sand waves primarily ranges from 5 to 8 m, and their average length ranges from about 100 to 500 m. The asymmetrical shape of most of the waves suggests that they migrate in response to present-day hydraulic conditions. Orientation of the steepest faces of the sand waves is quite variable, indicating that the pattern of bottom current movement in Taiwan Strait is probably quite complex. (Knapp-USGS)
W74-07175

A NOTE ON THE AREAL DISTRIBUTION OF SUSPENDED SEDIMENT YIELD IN SOUTH AFRICA,
Nottingham Univ. (England).
J. C. Doornkamp, and P. D. Tyson.
Journal of Hydrology, Vol 20, No 4, p 335-340, December 1973. 3 fig, 12 ref.

Descriptors: *Sediment yield, *Suspended load, Equations, Africa, Erosion, Soil erosion, Topography, Rainfall, Weathering, Silts, Sediment transport, Runoff.
Identifiers: *South Africa, Fournier equation.

Suspended sediment yield was calculated by means of Fournier's equations for 214 locations in South Africa. The areal distributions agree well with field data. Areas of pronounced relief yield most suspended sediment, especially from the Transvaal Escarpment zone, northeast Lesotho, the Natal Drakensburg, and the Cape Mountains. Locally high values occur inland (for example, in the Waterberg Plateau north of Nylstroom). Valley rainfall records inadequately define mountain precipitation leading to an underestimate of likely actual values of sediment yield in some areas. Man-induced soil erosion locally increases suspended sediment yields, as do areas of deeply weathered bedrock. (Knapp-USGS)

A NEW LOOK AT RIVER CAPTURE AND AT THE DENUDATION HISTORY OF THE WEALD,
Natural Environment Research Council, London (England). Inst. of Geological Sciences.
B. C. Worssam.
Report No 73/17, 1973. 21 p, 6 fig, 1 tab, 69 ref.

Descriptors: *Erosion, *Geomorphology, *Gradients(Streams), Terraces(Geologic), Terrain analysis, Topography, Slopes, Valleys, Land forming, Quaternary period.
Identifiers: *Great Britain(England).

Terraces in the upper parts of the valleys of the rivers Mole, Wey and Arun, in the western part of the Weald, southeast England, are primarily climatic rather than graded to various Pleistocene sea levels. Many instances of river capture in the Weald, including the well-known case of capture of the Blackwater by the Wey at Farnham, are described. All of them could well have been brought about by a downstream-acting overflow process. The term 'diversion' is preferable to 'river capture' or 'piracy'. The concept of dynamic equilibrium, put forward by J. T. Hack in 1960, provides a simpler explanation of the present topography of the Weald than does the cycle of erosion theory of W. M. Davis. Geological evidence for peneplanation of the Weald appears to be lacking. (Knapp-USGS)
W74-07324

SEDIMENT DISCHARGE IN THE LAKE TAHOE BASIN, CALIFORNIA, 1972 WATER YEAR,
Geological Survey, Menlo Park, Calif.
C. G. Kroll.
Open-file report, September 19, 1973. 33 p, 3 fig, 8 tab, 6 ref, 2 append.

Descriptors: *Sediment discharge, *California, *Sediment yield, *Soil erosion, *Highways, Sampling, Data collections, Runoff, Sediment transport.
Identifiers: *Lake Tahoe(Calif).

Streamflow and fluvial-sediment discharge data are being collected at selected streams and highway gutters in the Lake Tahoe basin to determine the extent of erosion from highway cuts and to evaluate the effects of various land treatment practices to reduce erosion. Precipitation in the Lake Tahoe area during 1972 was 77 percent of normal; consequently, runoff was well below normal. Seventy-six percent of the total annual runoff during the 1972 water year occurred from March through June 1972. Sediment samples were collected during the year at streamflow gaging stations and at gutter stations at highway cuts to define the range of transport conditions. The major part (87 percent) of the annual suspended-sediment discharge during the 1972 water year occurred during the snowmelt runoff period, March through June. (Knapp-USGS)

THE RELATIONSHIP OF POROSITY AND ANGLE OF REPOSE TO MIXTURE PROPORTIONS IN ASSEMBLAGES OF DIFFERENT SIZED MATERIALS,
Bristol Univ. (England). Dept. of Geography.
I. Statham.
Sedimentology, Vol 21, No 1, p 149-162, February 1974. 7 fig, 2 tab, 23 ref.

Descriptors: *Porosity, *Sedimentology, *Shear, *Shear strength, Sedimentation, Deposition(Sediments).
Identifiers: Angle of repose(Sediments).

Repose angles of mixtures of glass spheres were studied in rotating drums. Angle of shear is strongly influenced by the proportions of the mixture; it reached a peak value for the minimum porosity mixture. This was attributed to increased dilatation on the shear plane during avalanching. The geomorphic significance of these observations, in terms of slope development, is discussed. Angle of shear, as measured in a rotating drum, is variable, not a true constant, and cannot be exactly analogous to angle of internal sliding friction at constant volume as measured in a shearbox test. It is tentatively suggested that at least some of the variability is attributable to kinetic energy released on failure. (Knapp-USGS)
W74-07330

A SCANNING ELECTRON MICROSCOPE STUDY OF SURFACE TEXTURES OF QUARTZ GRAINS FROM GLACIAL ENVIRONMENTS,
Cambridge Univ. (England). Dept. of Geography.
W. B. Whally, and D. H. Krinsley.
Sedimentology, Vol 21, No 1, p 87-105, February 1974. 15 fig, 1 tab, 30 ref.

Descriptors: *Sediments, *Quartz, Electron microscopy, *Glacial drift, Alluvium, Till, Glaciology, Sedimentology.
Identifiers: *Switzerland(Feegletscher).

Surface textures of quartz sand grains from several glacial environments at the Feegletscher, Switzerland were examined by means of scanning electron microscopy. The difference between supraglacial and subglacial material is very slight. Glacial and extraglacial environments in the vicinity of glaciers are apparently not distinguishable. Examination of surface precipitation features suggests a sequence of events which can be used to help discriminate between different ages of deposits in an area. A similarity between some of the surface debris from moraine samples and those seen in loess and quickclay deposits is also suggested. (Knapp-USGS)

SUPPLY OF TERRIGENOUS MATERIAL TO THE BALTIC SEA (PITANIYE BALTIYSKOGO MORYA TERRIGENNYM MATERIALOM),
Akademiya Nauk SSSR, Kaliningrad. Institut Okeanologii.
A. I. Blazhchishin, and Yu. D. Shuyskiy.
Litologiya i Poleznyye Iskopayemyye, No 3, p 141-145, May-June 1973. 1 fig, 1 tab, 18 ref.

Descriptors: *Sedimentation, *Deposition(Sediments), *Sediment transport, *Sediment load, *Dissolved solids, Suspended solids, Suspended load, Bed load, Erosion, Beach erosion, Water pollution sources.
Identifiers: *USSR, *Baltic Sea.

The drainage area of the Baltic Sea, including the Lake Ladoga basin, is 1,566,000 sq m or 3.7 times larger than the area of the sea itself. Average annual dissolved-ion discharge into the sea is 46.6 million metric tons, of which 28.1 million metric tons is HCO3, 10.4 million metric tons--Ca, 3.1 million metric tons--SO4, 1.8 million metric tons--Mg, 1.8 million metric tons--Na + K, and 1.4 million metric tons--Cl. Rivers of the basin discharge annually about 3 million metric tons of biogenic elements (SiO2, Fe, P) and 7 million tons of organic matter. The amount of dissolved solids resulting from discharge of groundwater directly into the sea is estimated at 2 million metric tons/yr. In all, 58.6 million metric tons of dissolved material are delivered annually to the sea. The amount of suspended solids is 5.2 million metric tons/yr, of which about 3.5 million metric tons/yr or 67% enters the deep part of the sea. The ratio of alluvial bedload to suspended and dissolved material gives a solids-discharge formula of 1.26 286. This ratio is substantially different from the sediment-discharge formula for the humid zone (1:3·25). The total amount of material obtained by erosion of shores and submarine slopes is presently 24.9-28.2 million metric tons/yr. The total amount of terrigenous material transported to the sea is 90.4 million metric tons/yr. The 58.6 million metric tons of dissolved material delivered annually to the sea reflects the predominance of chemical weathering over mechanical erosion. (Josefson-USGS)

ROLE OF TURBIDITY CURRENTS IN SEDIMENTARY PROCESSES (O ROLI MUT'YEVYKH POTOKOV V PROTSESSAKH OSADKONAKOPLENIYA),
Vsesoyuznyi Geologicheskii Institut, Leningrad (USSR).
S. I. Romanovskiy.
Litologiya i Poleznyye Iskopayemyye, No 3, p 29-37, May-June 1973. 47 ref.

Descriptors: *Turbidity currents, *Sedimentation, Stratification, Geologic time.
Identifiers: USSR, Turbidites, Flysch.

The present status of knowledge of turbidity currents as a physicogeological phenomenon is reviewed, and the role of these currents in sedimentation of past geological epochs is analyzed. Characteristics of the sedimentation mechanism of turbidity currents are described to explain conditions of formation of a number of textural features of turbidites. The problem of recognizing turbidites is discussed, and the possibility of a new approach to the solution of the problem of stratification is investigated in the light of the concept of turbidity currents. (Josefson-USGS)

MECHANISM OF ELEMENT DISTRIBUTION IN THE PACIFIC OCEAN (JAPANESE PROFILE) (K POZNANIYU MEKHANIZMA RASPREDELENIYA ELEMENTOV V TIKHOM OKEANE (YAPONSKIY PROFIL')),
Akademiya Nauk SSSR, Moscow. Geologicheskii Institut.
N. M. Strakhov, I. I. Volkov, and N. A. Lisitsyna.
Litologiya i Poleznyye Iskopayemyye, No 3, p 3-28, May-June 1973. 11 fig, 10 tab, 13 ref.

Descriptors: *Geochemistry, *Trace elements, *Distribution patterns, *Sediments, *Pacific Ocean, Marine biology, Oxidation, Reduction(Chemical), Profiles.
Identifiers: *USSR, Pelagic(Oceanography).

To study the mechanism of element distribution in sediments of the northwestern Pacific, a profile was measured in 1969 during the 46th voyage of the Soviet research vessel 'Vityaz' from Tatar Strait to Wake Island atoll. The total length of the profile was about 4,000 km. Two sharply different mechanisms are evident in the distribution of sedimentary materials on the floor of the ocean basin: the biological mechanism acts in the near-shore zone and governs the distribution of organic C, SiO2, Se, I, and Br; and the mechanical fractionation of allochthonous and autochthonous suspensions governs the distribution and accumulation of Cr, Fe, Ge, V, Al, Ti, Ga, Zr, Nb, Ta, Pb, Zn, As, Cu, Mn, Ni, Co, Mo, P, the rare earths, and probably others, throughout the entire length of the profile. Percentages of the elements increase from the shore to the pelagic zone, while the absolute masses decrease. Percentages of the elements depend on sediment grain size: fine fractions (0.01-0.001 and < 0.001 mm) are the principal carriers of trace elements. The presence of biogenic and mechanical fractionation in the Pacific and other oceans is a function of the enormous size of the ocean basins. (Josefson-USGS)

SUSPENDED-SEDIMENT YIELD IN RIVERS OF GOR'KIY OBLAST AS AN INDICATION OF RECENT EROSION PROCESSES (STOK VZVESHENNYKH NANOSOV V REKAKH GOR'KOVSKOY OBL. KAK POKAZATEL RAZVITIYA SOVREMENNYKH EROZIONNYKH PROTSESSOV),
Gorkovskii Gosudarstvennyi Pedagogicheskii Institut (USSR).
F. M. Bakanina.
Pochvovedeniye, No 4, p 131-133, April 1973. 1 tab.

Descriptors: *Suspended solids, *Sediment yield, *Sediment discharge, *Streams, *Erosion, Erosion rates, Erosion control, Turbidity.
Identifiers: *USSR(Gor'kiy Oblast).

The largest areas of eroded soils in Gor'kiy Oblast (20%-50%) are concentrated in the Central and Oka-Volga regions on the Volga right bank. Soils in the Sura and Oka-Tesha regions are somewhat less eroded. Soils of the Oblast are eroded mainly by spring melt waters. Turbidity of water in the Alatyr' River increases in spring by a factor of 300. Suspended-sediment yield is greatest in the Alatyr' River (73 metric ton/sq km/yr), considerably less in the P'yana and Sura Rivers (12 and 13 metric tons/sq km/yr) and less than 10 metric tons/sq km/yr in rivers of the northern part of the Oblast. Annual sediment yield is smallest in the Kerzhenets River (2.7 metric tons/sq km/yr) and in the Serezha River (0.56 metric tons/sq km/yr). Over 80% of suspended solids in rivers of the Oblast during floods and low flow is composed of coarse silt, ranging in size from 0.05 to 0.01 mm. Recent erosion processes are most intense in the Alatyr' River basin. Erosion control measures should take into account the rate of development of recent erosion rather than the actual degree of erosion of the area. The erosion rate can be determined from data on suspended sediments discharged by rivers and expressed in metric tons/sq km/yr, and from turbidity indices of river water. (Josefson-USGS)

MINERAL SPRINGS IN THE SUEZ RIFT VALLEY--COMPARISON WITH WATERS IN THE JORDAN RIFT VALLEY AND POSTULATION OF A MARINE ORIGIN,
Israel Atomic Energy Commission, Yavne. Soreq Nuclear Research Centre.
E. Mazor, A. Nadler, and M. Molcho.
Journal of Hydrology, Vol 20, No 4, p 289-309, December 1973. 8 fig, 4 tab, 12 ref.

Descriptors: *Water chemistry, *Mineral water, Springs, Sea water, Chlorides, Sodium, Bromine, Magnesium, Radium radioisotopes, Stable isotopes, Hydrogen sulfide, Carbon radioisotopes, Radioactive dating.
Identifiers: *Israel(Jordon Valley).

Fresh and mineral waters from the eastern margin of the Suez Rift Valley include sources that resemble the mineral waters in the Jordan Rift Valley. They are characterized compositionally by Cl>Na, the presence of NaCl and MgCl2, a Cl/Br ratio around 150, elevated radium and H2S content, elevated temperature, a light stable-isotope composition, and high carbon-14 age. The waters originated from entrapped seawater that gradually changed in composition by interaction with aquifer rocks. Such changes were demonstrated by laboratory experiments. (Knapp-USGS)

TH-234/U-238 ACTIVITY RATIOS IN PACIFIC OCEAN BOTTOM WATERS,
Tata Inst. of Fundamental Research, Bombay (India).
B. S. Amin, S. Krishnaswami, and B. L. K. Somayajulu.
Earth and Planetary Science Letters, Vol 21, No 4, p 342-344, March 1974. 1 tab, 11 ref.

Descriptors: *Water chemistry, *Pacific Ocean, *Uranium radioisotopes, *Sea water, Sampling, Radioisotopes, Heavy metals, Chemical precipitation.
Identifiers: *Thorium.

Th-234/U-238 activity ratios in the near-bottom waters at a station in the South Pacific are close to the secular equilibrium value, ranging between 0.9 and 1.13 (plus or minus 8%). This suggests that the rate of removal of Th-234 by bottom-water scavenging processes is slow compared to its rate of radioactive decay. The mean activity ratio in these waters is 1.14 plus or minus 0.02, the same as the reported values for the world oceans. (Knapp-USGS)

STUDIES OF THE INGREDIENTS VARIATION OF THE SAKE-GAWA RIVER, A TRIBUTARY OF THE MOGAMI RIVER (IN JAPANESE),
Yamagata Prefectural School for the Blind, Kaminoyama (Japan).
N. Aita.
Jap J Limnol. Vol 33, No 2, p 11-15. 1972. Illus. (English summary).
Identifiers: Alkalinity, *Calcium, *Chlorides, Flow, Ingredients, *Japan(Mogami river basin), Rivers, Tributaries, Thaw.

As is usual in the snowy districts, the melting snow in spring causes the rise of river water. In the Sake-gawa River (Japan) a thaw usually begins early in March and continues for about 3 mo. Judging from the variations of its flow rate, the snow-thawing season is divided into 3 stages. Throughout the thawing season, the concentrations of Cl and Ca ions are kept rather high in spite of the large flow rate. Different from the ions, the alkalinity is negatively correlated with the logarithm of the flow rate at the same period. The observations of the concentration of dissolved mineral show that the amount of transportation (Qd) is proportional to the 'n'th power of the flow rate (Q), i.e., Qd = aQn, where 'n' are the constants dependent on the ions and the stage of snow thawing. In the case of chloride ion, the value of 'n' is in the following order: the beginning > the middle stage = the end. At the beginning stage, the atmospheric salt in the fallen snow conveyed by the monsoon in winter is transported rapidly in the river water. As for the Ca ion, the value of 'n' is in the order: the beginning > the end > the middle stage. The total amount of transported Cl ion during the snow-thawing season is about a half of the yearly amount. The same is true of the Ca ion.--Copyright 1973, Biological Abstracts, Inc.

STRONTIUM AND OTHER NOTABLE CHEMICAL CONSTITUENTS OF WELL-WATER OF ALLEN COUNTY, INDIANA,
Geological Survey, Bloomington, Ind.
C. F. Foley, N. K. Bleuer, R. K. Leininger, and W. C. Herring.
Proceedings of the Indiana Academy of Science, Vol 82, p 274-280, 1972. 3 fig, 1 tab, 10 ref.

Descriptors: Aquifer characteristics, Glacial aquifers, Soil water, Bedrock, *Indiana, Hydrologic data, Geomorphology, Stratigraphy, *Water chemistry, *Groundwater, *Strontium, *Iron, *Sulfates, Solutes, Metals, Cations, Anions, Dolomite, Glacial sediments, Pyrite, Shales, Alkalinity, Bicarbonates, Magnesium, Hardness(Water), Calcium, Glaciohydrology.
Identifiers: Allen County(Ind).

Fourteen waters from aquifers in glacial deposits and 31 samples from aquifers in bedrock were obtained for a water quality study of Allen County, Indiana. Glacial waters contained relatively high concentrations of Fe, Sr, and sulfate. The Fe probably derived from pyrite in Antrim Shale particles. The Ca/Mg ratio decreased generally from north to south and may reflect southward increasing dolomite contents of glacial deposits. Bedrock waters contained much less Fe, but generally more Sr and sulfate. Total solids, sulfate, Sr, bicarbonate alkalinity, water hardness, and the ratio of Sr atoms/1000 Ca atoms increased from NW to SE. Areal distributions of these constituents reflect relationships with bedrock stratigraphy and groundwater flow. (Brown-IPC)

ULTRA-VIOLET ABSORPTION CHARACTERISTICS OF NATURAL WATERS,
University Coll. of North Wales, Menai Bridge. Marine Science Labs.
P. Foster, and A. W. Morris.
Water Research, Vol 8, No 3, p 137-142, March 1974. 7 fig, 1 tab, 5 ref.

Descriptors: *Salinity, *Ultraviolet radiation, *Tracking techniques, Sea water, Runoff, *Organic matter, Tracers, Path of pollutants, Remote sensing, *Absorption.

Concurrent measurements of salinity and u.v. absorbance at selected wavelengths were made on waters collected from an inshore sea area subject to the influence of a number of sources of land drainage. An inverse relationship was found between salinity and absorbance in the spectral region 250-350 nm. As a result of the difference in the absorbance and variations in the relative absorbance in different spectral regions of the fresh water sources, various water masses could be distinguished in the sea. (Knapp-USGS)

Descriptors: *Cadmium, *Mud, *Adsorption, Path of pollutants, Rivers, Chelation, Sorption, Humic acids, *Organic matter, Water chemistry, Water quality.

The adsorption of cadmium on mud solids and particles of clay, silica, humic material and other naturally occurring solids was studied using radiochemical methods. Cadmium concentrations in the range of micrograms per liter could be used. The variation of the extent of adsorption with many of the large number of factors involved was investigated and concentration factors (distribution coefficients) were determined. Rates of adsorption and desorption were rapid. Concentration factors for river muds varied between 5000 and 50,000 and depended mainly on the type of solid, its state of subdivision, the concentration of metal ion present, the time of contact and the concentration of complexing ligands. Humic material appeared to be the main component of river mud responsible for adsorption. Adsorption and desorption processes are major factors in controlling the concentration of cadmium in natural waters and tend to counteract changes in the concentration of the metal ion in solution. MINERAL SPRINGS IN THE SUEZ RIFT VALLEY - COMPARISON WITH WATERS IN THE JORDAN RIFT VALLEY AND POSTULATION OF A MARINE ORIGIN,
Israel Atomic Energy Commission, Yavne. Soreq. Nuclear Research Center.
E. Mazor, A. Nadler, and M. Molcho.
Journal of Hydrology, Vol 20, No 4, p 289-309, December, 1973. 8 fig, 4 tab, 15 ref.

Descriptors: *Water quality, *Water types, Water analysis, Water chemistry, Water pollution sources.
Identifiers: *Red Sea Rift.

Fresh and mineral waters from the eastern margin of the Suez Rift Valley are described. They include a fair number of sources that resemble the mineral waters in the Jordan Rift Valley. The term Tiberias-Farun water is thus suggested to describe them. They are characterized compositionally by Cl>Na, the presence of NaCl and MgCl2, a Cl/Br ratio around 150, elevated radium and H2S content, elevated temperature, a light stable-isotope composition and high carbon-14 age. The Tiberias-Farun waters are suggested to have originated from entrapped seawater that gradually changed in composition by interaction with aquifer rocks. Such changes were demonstrated to take place in the laboratory experiments. (Skogerboe-Colorado State)

BROMINE IN GROUNDWATER OF UZBEKISTAN (BROM V PODZEMNYKH VODAKH UZBEKISTANA),
Institute of Hydrogeology and Engineering Geology, Tashkent (USSR).
L. A. Kalabugin
Uzbekskiy Geologicheskiy Zhurnal, No 6, p 30-32, 1972

Descriptors: *Geochemistry, *Water chemistry, *Bromine, *Groundwater basins, Geologic time, Brines, Salinity
Identifiers: *USSR(Uzbek SSR), Mineralization.

Groundwater with a high bromine content was discovered in Uzbekistan on the Ustyurt Plateau, in lower reaches of the Amudar'ya River, and in the Bukhara-Karshi, Surkhandar'inskiy and Fergana artesian basins. Stratigraphically, these waters are confined to Permian-Triassic, Jurassic, Cretaceous, and Paleocene deposits. The chemical composition of the waters is of the sodium- and calcium-chloride types, being weak to strong brines. The pH of the waters ranges from mildly acidic to neutral. The waters are metamorphosed and belong principally to waters derived from residual brine of marine lakes in the absence of water exchange with the ground surface. The bromine content in water increases down valley and with increasing mineralization. Bromine may originate from the destruction of bromine-organic compounds at high temperatures and pressure. (Josefson-USGS)

Identifiers: Kettleman Hills(Calif), Lithium, Rubidium, Barium.

In the Kettleman North Dome oilfield in California, the waters from the Temblor formation (Miocene) are principally meteoric in origin, related to recharge areas located to the west. Their chemistry relative to meteoric water is attributed to hyperfiltration through geological membranes as well as to water-rock interactions. The chemistry of the waters in each subzone of the Temblor formation is characteristic of that subzone and shows membrane effluent characteristics to a given subzone with respect to the one stratigraphically below it. The chemical relations are attributed to increased efficiency of shale membranes with increased depth of burial. Membrane behavior of shales controls completely or in part the distribution of the following ratios: Li/Na, Rb/Na, NH3/Na, Mg/Ca, Sr/Ca, Ca/Na, alkalinity/Cl, SO4/Cl, I/Br, and B/Cl. Some of these ratios are modified by temperature-controlled water-rock interactions. The K/Na ratios and the SiO2 and Ba concentrations are completely dependent on water-rock interactions. ROTATING RING-DISK ELECTRODE STUDY OF THE ADSORPTION OF LEAD ON GOLD IN 0.5M POTASSIUM CHLORIDE,
State Univ. of New York, Buffalo. Dept. of Chemistry.
V. A. Vicente, and S. Bruckenstein.
Analytical Chemistry, Vol 45, No 12, p 2036-2043, October 1973. 10 fig, 4 tab, 27 ref.

Descriptors: *Adsorption, *Lead, *Electrochemistry, Zeta potential, Heavy metals, Ions, Oxidation, Chlorides, *Electrodes.
Identifiers: Rotating ring-disk electrodes, *Gold electrodes, Cyclic voltammetry, Anodic stripping voltammetry, Chemical concentration, Chemical interference, Ion selective electrodes, Desorption, Potassium chloride.

The underpotential deposition of Pb(0) on gold occurred at OV greater than E sub D greater than minus 0.6V (SCE) using cyclic voltammetry at a rotating gold ring-disk electrode. A complete monolayer of Pb atoms on gold is equivalent at 420 microC/geometric sq cm or about 247 microC/real sq cm. Bulk Pb(0) deposition does not occur until this amount of charge has been consumed. The monolayer of underpotential Pb(0) yields three peaks upon anodic stripping. Further, adsorption of Pb(II) on gold occurs during the cathodic disk potential scan and begins at about plus 0.6V. From ring collection data, about 20 percent of a monolayer equivalent remains absorbed at the disk as a lead(II) species during the anodic disk potential scan. Complete desorption occurs just before the potential for the dissolution of gold (E sub D equivalent or equal to plus 0.7V) in the chloride medium. (Holoman-Battelle)

MASS AND CHARGE TRANSFER KINETICS AND COULOMETRIC CURRENT EFFICIENCIES. PART VII. CONDITIONAL POTENTIALS, AND SINGLE-SCAN VOLTAMMETRY OF PURE VANADIUM(V) - VANADIUM(IV) SYSTEMS IN VARIOUS MEDIA AT PLATINUM ELEC TRODES PRE-TREATED BY FIVE METHODS,
Exeter Univ. (England). Dept. of Chemistry.
E. Bishop, and P. H. Hitchcock.
Analyst, Vol 98, No 1169, p 553-562, August 1973. 6 fig, 26 ref.

Descriptors: *Kinetics, Chemical reactions, Hydrogen ion concentration, Electrochemistry, Electrolytes, Heavy metals, Aqueous solutions, Oxidation, Electric currents, Efficiencies, Zeta potential.
Identifiers: *Vanadium, *Mass transfer, *Charge transfer, *Single scan voltammetry, *Platinum electrodes, Coulometric currents, Pretreatment methods, Electrochemical reactions, Voltammetry, Isopolymerization reactions, Ion selective electrodes.

The limited previous work on vanadium is reviewed. Five methods of electrode pre-treatment have been selected and are described. The variation of the conditional potential of the vanadium(V) - vanadium(IV) system with hydrogen-ion concentration is reported. The experimental work is complicated by isopolymerization reactions, of which at least one is kinetically slow. The voltammetric reduction of vanadium(V) in saturated potassium sulphate - acetate buffer at pH 4.0 is examined: the benefit of shifting solvent reaction potentials to more negative potentials is nullified by the direct reduction of un-ionized acetic acid. A similar examination is made in a medium of 0.00001 M sulphuric acid and in one of 2.0 M sulphuric acid. Possible adsorption effects are canvassed. The comples behavior at intermediate hydrogen-ion concentrations is discussed, with illustrations drawn from a sulphuric acid medium of pH 2.0. The anodic oxidation of vanadium(IV) is briefly examined. It is concluded that the electrochemical behavior of the vanadium system is strongly dependent on hydrogen-ion concentration and on the electrode pre-treatment. The electrode can be chemically oxidized in vanadium(V) solutions. The mechanism is a one-step one-electron process. No evidence could be found for reduction below the plus 4 oxidation state at platinum. Vanadium(IV) cannot be oxidized without severe loss of current efficiency, nor reduced to vanadium(III) at platinum electrodes. (See also W74-07558) (Holoman-Battelle)

ELEMENTAL VARIABILITY WITHIN A SAMPLING UNIT,
Ohio Agricultural Research and Development Center, Wooster.
L. R. Drees, and L. P. Wilding.
Soil Sci Soc Am Proc. Vol 37, No 1, p 82-87, 1973. Illus.
Identifiers: *Sampling, *Spectroscopy(X-ray), Variability, *Trace elements.

To determine the magnitude of lateral variability within an area of 1-2 m2, 6 profiles were sampled at 0.6 m-intervals at each of 3 different sites representing loess, till and outwash deposits. Elemental Ti, Zr, Fe, Ca, and K were determined by X-ray spectroscopy for 50-20 micron and 2-5 micron fractions of selected horizons within each profile. Coefficients of variation within these deposits ranged from 1-13% for Ti, 4-20% for Zr, 3-20% for Fe, 5-13% for Ca, and 2-9% for K. The order of variability was loess less than or equal to till < outwash. No consistent differences in elemental variability were observed between size fractions or horizons (i.e., A, B, or C). Elemental data from a single horizon within a vertical profile will seldom permit mean estimates closer than plus or minus 10-20% (95% confidence interval) for loess and till deposits, and plus or minus 20-45% for the more variable outwash deposits. Three lateral subsamples within a given horizon would permit mean estimates of above elements within plus or minus in loess and till but 20 subsamples would be required to achieve similar accuracies in some outwash deposits. Such data emphasize the need to multiply subsample horizons in a lateral dimension if mean estimates are to be accurate within 10-20% over an area approximating a pedon or sampling pit. The number of subsamples for a given horizon is a function of the element under consideration, nature of deposit, and precision of mean estimate desired.--Copyright 1973, Biological Abstracts, Inc.

REMANENT MAGNETIZATION OF MODERN TIDAL FLAT SEDIMENTS FROM SAN FRANCISCO BAY, CALIFORNIA,
Stanford Univ., Calif. Dept. of Geology.
S. Graham.
Geology, Vol 2, No 5, p 223-226, May 1974. 7 fig, 1 tab, 15 ref.

Descriptors: *Bottom sediments, *Mud flats, *California, *Magnetic studies, Sedimentology, Sedimentation, Deposition(Sediments), Sampling, Bottom sampling.
Identifiers: *Tidal flats, *San Francisco Bay, Bioturbation.

Sediments from mud flats of the upper bare zone of San Francisco Bay, California, tidal flats possess remanent magnetization uniform in intensity and direction. The uniformity of magnetization and considerations of the stability of iron species in low Eh, low pS environments (reducing marine conditions) indicate that the remanent magnetization is not chemical remanent magnetization. The pervasiveness of bioturbation in the tidal flat setting, a lack of inclination errors, and the consistent north-directed magnetization acquired by experimentally slurried bay sediment (simulating bioturbation) suggest that the remanent magnetization is postdetrital remanent magnetization related to bioturbation of wet tidal flat sediments. ENVIRONMENTAL FRAMEWORK OF COASTAL PLAIN ESTUARIES.
Proceedings of Symposium on Estuaries, 18th Annual Meeting of the Southeastern Section of Geological Society of America, April 10-11, 1969, Columbia, S C: Geological Society of America, Inc, Memoir 133, B. W. Nelson, editor, 1972. 619 p.

Descriptors: *Estuaries, *Sedimentation, *Water pollution effects, Deposition(Sediments), Erosion, Sediment transport, Water chemistry, Water circulation, Coastal plains.

Estuarine water circulation, sedimentation, and water pollution are discussed in this collection of symposium papers. Water circulation patterns are the principal control of sedimentation and are the factor most commonly modified by man's activity. Pollution is common in estuaries because they are the sites of many of the world's major cities. (See W74-07226 thru W74-07250) (Knapp-USGS)

RECENT INVESTIGATIONS IN STRATIFIED FLOWS RELATED TO ESTUARIAL HYDRAULICS,
Florida Univ., Gainesville. Dept. of Coastal and Oceanographic Engineering.
E. Partheniades.
In: Environmental Framework of Coastal Plain Estuaries; 18th Annual Meeting of Southeastern Section of the Geological Society of America, April 10-11, 1969, Columbia, S C: Geological Society of America, Inc, Memoir 133, p 29-70, 1972. 24 fig, 1 tab, 23 ref.

Descriptors: *Mixing, *Stratified flow, *Estuaries, *Saline water intrusion, Hydraulics, Streamflow, Tides, Turbulence, Diffusion, Dispersion, Equations, Reviews.

Equations are available for flow in fully stratified, partially and well-mixed estuaries. The analytical solutions, mostly one-dimensional to date, are very useful in predicting the effects of changes in the estuary regime on salinity intrusion and shoaling patterns. Stratified estuaries have a discontinuous interface between saltwater and freshwater across which very little mixing occurs. In channels, unbalanced downstream pressure forces near the freshwater end overcome the frictional resistance at the interface and contribute to an increase of the velocity head; at the saltwater end an unbalanced pressure force drives saltwater upstream near the bottom. Analytical expressions exist for interfacial stability, mixing, and interfacial and bed shear stresses. The hydraulic equations predict increase in the saltwater intrusion length with increase of channel depth or decrease of freshwater flow. In real estuaries, tides generate shearing stresses that break the interface and mix saltwater and freshwater. Mixing increases with increasing tidal amplitude and decreasing freshwater flow. Continuous entrainment, mixing, upstream and downstream saltwater movement induce a net upstream flow of saltwater near the bottom, just as in the fully stratified case, when the average transport over a tidal period is considered. Mixing is a complex combination of turbulent eddy diffusion, longitudinal dispersion, and gravitational convection. The diffusion coefficient depends on the rate of dissipation of energy due to tidal forces and the degree of vertical mixing. Vertical mixing usually is downward in the first half of the intrusion length but upward in the second half and depends on the degree of stratification. (See also W74-07225) (Knapp-USGS)
W74-07226

INFLUENCE OF MINERAL-WATER REACTIONS IN ESTUARIES ON BORON BUDGET IN THE OCEANS,
Florida State Univ., Tallahassee. Dept. of Oceanography.
R. C. Harriss.
In: Environmental Framework of Coastal Plain Estuaries; 18th Annual Meeting of Southeastern Section of the Geological Society of America, April 10-11, 1969, Columbia, S C: Geological Society of America, Inc, Memoir 133, p 71-77, 1972. 1 tab, 39 ref.

Descriptors: *Water chemistry, *Estuaries, *Boron, Salinity, Sea water, Water balance, Mineralogy, Sedimentation, Adsorption, Chemical precipitation.

A quantitative mass balance calculation indicates that mineral-water reactions in estuaries are the primary control on the boron content of seawater. The total annual removal of boron from the oceanic reservoir by mineral-water reactions and biogenic sedimentation is approximately equal to the total annual influx of boron in continental drainage, indicating that under present conditions the boron content of seawater is about constant with time. Because the buffer system controlling the boron content of seawater is independent of buffer systems controlling most other elemental concentrations in seawater, a constant boron-salinity relation over long periods of geologic time cannot be expected. AMAZON RIVER ESTUARINE SYSTEM,
Northwestern Univ., Evanston, Ill. Dept. of Geology.
R. J. Gibbs.
In: Environmental Framework of Coastal Plain Estuaries, 18th Annual Meeting of Southeastern Section of the Geological Society of America, April 10-11, 1969, Columbia, S C: Geological Society of America, Inc, Memoir 133, p 85-88, 1972. 2 fig, 1 tab, 2 ref.

Descriptors: *Estuaries, *Mixing, *Stratified flow, Saline water intrusion, Water circulation, Density stratification.
Identifiers: *Amazon River.

Results of preliminary survey of the water circulation in the Amazon estuary during high river and low river discharge indicate that, due to the river's large discharge, no saltwater wedge enters the Amazon estuary. Rather, an area of turbulent mixing near the river mouth is indicated by a zone a nearly vertical isohalines. As the vertical mixing decreases seaward, vertical stratification develops offshore, persisting seaward across the continental shelf. (See also W74-07225) (Knapp-USGS)
W74-07229

BIODEPOSITION AS A FACTOR IN SEDIMENTATION OF FINE SUSPENDED SOLIDS IN ESTUARIES,
Virginia Inst. of Marine Science, Gloucester Point.
D. S. Haven, and R. Morales-Alamo.
In: Environmental Framework of Coastal Plain Estuaries; 18th Annual Meeting of Southeastern Section of the Geological Society of America, April 10-11, 1969, Columbia, SC: Geological Society of America, Inc., Memoir 133, p 121-130, 1972. 6 fig, 1 tab, 16 ref. AEC Grant AT-(40-1)-2789.

Descriptors: *Deposition(Sediments), *Sedimentation, *Estuaries, Sedimentology, Benthos, Settling velocity, Suspended load.
Identifiers: Biodeposition(Sediments).

Filter feeders, such as mollusks, tunicates, and barnacles, ingest particles as small as 1 micron during their feeding process and void them in fecal pellets which range from 500 to 3,000 microns in length, these pellets settle at a much faster rate than their component particles. Oyster biodeposits contain 77% to 91% inorganic matter, 4% to 12% organic carbon, and about 1.0 gram per kilogram of phosphorus. Fecal pellets are alternately deposited and resuspended by tidal currents. They settle and accumulate in areas of estuaries where the fine particles themselves would not. A portion of the biodeposits settling on sediment surfaces is mixed into subsurface deposits and may alter the textural and chemical properties of the original sediments. (See also W74-07225) (Knapp-USGS)

SPATIAL AND TEMPORAL DISTRIBUTION OF SUSPENDED SEDIMENT IN NARRAGANSETT BAY AND RHODE ISLAND SOUND,
Naval Underwater Systems Center, Newport, R.I.
R. W. Morton.
In: Environmental Framework of Coastal Plain Estuaries; 18th Annual Meeting of Southeastern Section of the Geological Society of America, April 10-11, 1969, Columbia, SC: Geological Society of America, Inc, Memoir 133, p 131-141, 1972. 7 fig, 5 ref.

Descriptors: *Sediment load, *Suspended load, *Sedimentation, *Estuaries, Rhode Island, Distribution patterns, Sedimentation rates.
Identifiers: *Narragansett Bay(R.I.), Rhode Island Sound.

The suspended sediment concentrations in Narragansett Bay and Rhode Island Sound were measured using a continuous-flow centrifuge. Average concentrations were 3.17 milligrams of sediment per liter in the Bay and 1.83 milligrams per liter in the Sound. Most of the sediment entering the estuary from the tributaries is deposited near the head of the Bay, but there is a secondary depositional area near the center of the Bay in zones of weak and variable currents. The average rate of deposition for the entire bay during the fall months was 0.092 grams per square centimeter per year, and the net transport through the estuary was 10% of the tributary sediment load, or 910 grams per second. (See also W74-07225) (Knapp-USGS)
W74-07232

SUSPENDED SEDIMENT TRANSPORT IN DELAWARE BAY,
Millersville State Coll., Pa.
B. L. Oostdam, and R. R. Jordan.
In: Environmental Framework of Coastal Plain Estuaries; 18th Annual Meeting of Southeastern Section of the Geological Society of America, April 10-11, 1969, Columbia, SC; Geological Society of America, Inc, Memoir 133, p 143-149, 1972. 4 fig, 17 ref.

Descriptors: *Sediment transport, *Suspended load, *Estuaries, Currents(water), Advection, Sampling, Tides, Water circulation.
Identifiers: *Delaware Bay.

Sverdrup's simple advective model of estuarine circulation is extended to include suspended sediment transport. Substitution of average flow and turbidity figures suggests a net landward suspended sediment transport into Delaware Bay near the bottom. The resulting projected sedimentation rate of 15 cm per century corresponds reasonably well with figures for the regional relative sea-level rise. In the Delaware Bay mouth, two stations located in fingerlike channels near both shores show net landward sediment transport over a tidal cycle at almost all depths, whereas a station near the center of the bay mouth displays net seaward transport at all levels. TRIBUTION AND TRANSPORTATION OF SPENDED SEDIMENT IN UPPER EASAPEAKE BAY,
ns Hopkins Univ. Baltimore, Md. Chesapeake y Inst.
. Schubel.
Environmental Framework of Coastal Plain uaries; 18th Annual Meeting of Southeastern tion of the Geological Society of America, ril 10-11, 1969, Columbia, SC: Geological iety of America, Inc, Memoir 133, p 151-167, 2. 12 fig, 17 ref.

scriptors: *Sedimentation, *Sediment trans-t, *Estuaries, *Chesapeake Bay, Suspended d, Water circulation, Streamflow, Floods, Peak charge, Distribution patterns.
ntifiers: *Susquehanna River.

he upper reaches of the Chesapeake Bay there ur two distinctive distributions of suspended iment and associated patterns of sediment nsport. During the spring freshet the squehanna River overpowers the characteristic tidal estuarine circulation in the upper 20 to 30 meters of the estuary, and the net flow and iment transport are seaward at all depths. The rked decrease seaward of the concentration of pended sediment in the upper bay reveals the se link, during the freshet, between the pended sediment and the principal ultimate rce of sediment--the Susquehanna River. With siding river flow the net nontidal estuarine cir-ation is reestablished in the upper bay, and a bidity maximum is formed. The high concentra-ns of suspended sediment, greater than those ier farther upstream in the source river or ther seaward in the estuary, are produced and intained primarily by the periodic resuspension ottom sediment by tidal scour and by the sedi-nt trap created in the upper reaches of the uarine circulation regime. O DE LA PLATA ESTUARY ENVIRON-NTS,
mont-Doherty Geological Observatory, isades, N. Y.
M. Urien.
Environmental Framework of Coastal Plain uaries; 18th Annual Meeting of Southeastern tion of the Geological Society of America, ril 10-11, 1969, Columbia, S C: Geological iety of America, Inc, Memoir 133, p 213-234, 2. 10 fig, 4 tab, 12 ref.

scriptors: *Estuaries, *Sedimentation, Cur-nts(Water), Water circulation, Sediment trans-t, Beaches, Sands, Silts.
ntifiers: *Argentina(Rio de la Plata).

e Rio de la Plata is an estuary 220 km long and to 230 km wide in Argentina. The upper river a freshwater invironment where the Uruguay Parana River systems converge. The Parana er is building a delta in the upper Rio de la ta. The hydraulic system has an average yearly charge of 25,000 cu m per sec. The mouth of estuary is open to the sea. Because the tide, l currents, wind, and waves affect the fluvial charge, the river flow is not continuous. Ap-ently the saltwater influence on sedimentation ess than that of dynamic action. Over the estua-bottom lie silty sand and silty clay. The river iment supply consists mainly of silt and clay. In upper estuary the sand is scarce and localized anks, bars, and beaches. In the outer estuary a d carpet extends from the inner continental lf into the estuary. These are relict sands of the Holocene transgression which invaded the uary between 7,000 and 3,000 years B.P. After locene time fluvial mud facies covered, in part, transgressive sands. The south coastal en-nment is estuarine, with its maximum develop-nt in Samborombon Bay. The north coast is ky and sandy with pocket beaches. The regional estuarine environment is mostly fluvial, but the mixing of ocean waters creates a gradual change from fluvial in the upper river to fluvio-marine and marine in the outer river. REGIONAL CLAY MINERAL FACIES IN ESTUARIES AND CONTINENTAL MARGIN OF THE UNITED STATES EAST COAST,
Geological Survey, Woods Hole, Mass.
J. C. Hathaway.
In: Environmental Framework of Coastal Plain Esutaries; 18th Annual Meeting of Southeastern Section of the Geological Society of America, April 10-11, 1969, Columbia, S C: Geological Society of America, Inc, Memoir 133, p 293-316, 1972. 14 fig, 31 ref.

Descriptors: *Sedimentation, *Estuaries, *Provenance, *Atlantic Coastal Plain, *Clay minerals, Clays, Kaolinite, Illite, Mineralogy, Sediment transport, Facies(Sedimentation), Southeast U.S., Northeast U.S.

The clay minerals in many estuaries of the eastern United States differ from these in the sediments of the rivers that feed these estuaries. Illite and chlorite are characteristic minerals of the estuaries as far south as Chesapeake Bay, yet chlorite is minor and illite is reduced in concentration in the rivers south of the Hudson. Dioctahedral vermiculite is common in river sediments along the entire coast, yet it is important in estuarine sediments only in Pamlico Sound and the Neuse River estuary, North Carolina. Two major clay mineral facies are observed in the estuaries and on the continental margin: a northern facies characterized by illite, chlorite, and traces of feldspar and hornblende, and a southern facies characterized by montmorillonite and kaolinite. The similarity in composition between Chesapeake Bay and the estuaries to the north may be the result of reworking and redeposition of sediments contributed during Pleistocene time, inasmuch as the Chesapeake is the southermost estuary fed by rivers that drained glaciated areas. Shoreline erosion and reworking of still older sediments on the shelf probably also contribute clay to the estuarine sediments. Bottom drift directions suggest that clay material is moved southward along the shelf and into the mouths of the estuaries; there tidal mixing homogenizes the clay mineral composition over large areas. (See also W74-07225) (Knapp-USGS)

SOURCE OF RECENT NEARSHORE MARINE CLAYS, SOUTHEASTERN UNITED STATES,
Western Washington State Coll., Bellingham. Dept. of Geology.
D. R. Pevear.
In: Environmental Framework of Coastal Plain Estuaries; 18th Annual Meeting of Southeastern Section of the Geological Society of America, April 10-11, 1969, Columbia, S C: Geological Society of America, Inc, Memoir 133, p 317-335, 1972. 14 fig, 38 ref.

Descriptors: *Sedimentation, *Estuaries, *Provenance, *Atlantic Coastal Plain, *Clay minerals, Clays, Kaolinite, Illite, Mineralogy, Sediment transport, Facies(Sedimentation), *Southeast U.S.

Clays in the fine fraction of nearshore marine sediments from the southeastern United States are mineralogically different from clays from the rivers which drain into nearshore areas. River clays average 60% kaolinite with vermiculite nest in abundance, and illite, chlorite, and montmorillonite present in minor amounts. The main source of river clay must be the weathered feldspathic metamorphic rocks of the Piedmont. Small rivers which rise in the Coastal Plain carry montmorillonite and kaolinite, but their quantitative contribution to nearshore areas is very small. Nearshore marine clays of Florida, Georgia, and South Carolina average 50% montmorillonite, whereas those of North Carolina contain both illite and montmorillonite in abundance. A significant part of the nearshore clays must, therefore, come from nonriver sources. Shelf clays are montmorillonitic except off North Carolina where they are illitic as well. Hence, some nearshore clays may be derived either from the shelf or perhaps from erosion of coastal Pleistocence outcrops. Some illitic clay may be transported southward to North Carolina from shore and shelf areas to the north, but this mechanism appears not to operate south of North Carolina. River vermiculite may absorb potassium in the marine environment and collapse to illite. (See also W74-07225) (Knapp-USGS)
W74-07238

MASS PHYSICAL AND ENGINEERING PROPERTIES OF SOME YORK RIVER SEDIMENTS,
Lafayette Coll., Easton, Pa. Dept. of Geology.
R. W. Faas.
In: Environmental Framework of Coastal Plain Estuaries; 18th Annual Meeting of Southeastern Section of the Geological Society of America, April 10-11, 1969, Columbia, S C: Geological Society of America, Inc, Memoir 133, p 337-347, 1972. 4 fig, 4 tab, 14 ref. NSF Grant GY-4092.

Descriptors: *Sedimentology, *Soil strength, *Bottom sediments, *Virginia, *Estuaries, Silts, Clay, Sands, Mechanical properties, Shear strength.
Identifiers: *York River(Va).

In two 232-square-meter areas of the bottom sediments of the York River, Yorktown, Virginia, sediments found in 9 meters of water were clayey silts and those at 4 meters were silty and clayey sands. Some representative ranges for mass properties of the clayey silts are: buld (wet) density, 1,41 to 1.23; moisture content, 222% to 144%; porosity, 85% to 79%. For the silty and clayey sands, the same properties are bulk (wet) density, 2.43 to 1.27; moisture content, 97% to 49%; and porosity, 71% to 56%. In situ strength is consistently higher and has lesser variability than laboratory strength. Disturbance of the sedimentary fabric due to coring is believed responsible. STRONTIUM ISOTOPE COMPOSITION AND SEDIMENT TRANSPORT IN THE RIO DE LA PLATA ESTUARY,
Lamont-Doherty Geological Observatory, Palisades, N. Y.
P. E. Biscaye.
In: Environmental Framework of Coastal Plain Estuaries; 18th Annual Meeting of Southeastern Section of the Geological Society of America, April 10-11, 1969, Columbia, SC: Geological Society of America, Inc, Memoir 133, p 349-357, 1972. 3 fig, 1 tab, 11 ref. AEC contract AT (30-1) 4055.

Descriptors: *Tracers, *Strontium radiosotopes, *Sedimentology, *Estuaries, Sedimentation, Sediment sorting, Provenance, Sediment transport, Particle size.
Identifiers: Rubidium, *Argentina(Rio del la Plata estuary).

Rubidium, strontium, and strontium isotope composition were analyzed on a suite of whole, surface-sediment, carbonate-free samples from the Plata estuary, its major source rivers and the adjacent continental shelf. Rubidium and strontium analyses were also made on the greater-than-20-micron and less-than-20-micron fractions of the samples to determine the effect of size frequency distribution on one of the parameters. Because the Rb to Sr ratio and the Sr-87 to Sr-86 ratio varies with grain size, some of the large variability in Sr-87 to Sr-86 in the Plata must be due to differential

sedimentation processes within the estuary. Consideration of the data on an isochron diagram reduces some of this ambiguity and is consistent with an interpretation of two major sources of sediment in the estuary. These sources are the rivers Parana and Uruguay at the head of the estuary and Argentine continental shelf sediment at the mouth. A third source, Uruguayan shield material, along the estuary's north shore, is not distinguishable. (See also W74-07225) (Knapp-USGS)
W74-07240

TECHNIQUES FOR USE OF ORGANIC AND AMORPHOUS MATERIALS IN SOURCE INVESTIGATIONS OF ESTUARY SEDIMENTS,
J. Neiheisel.
In: Environmental Framework of Coastal Plain Estuaries; 18th Annual Meeting of Southeastern Section of the Geological Society of America, April 10-11, 1969, Columbia, SC: Geological Society of America, Inc, Memoir 133, p 359-381, 1972. 12 fig, 5 tab, 8 ref.

Descriptors: *Estuaries, *Bottom sediments, *Organic matter, *Analytical techniques, Electron microscopy, X-ray diffraction, Iron, Coak, Pyrite, Provenance, Differential thermal analysis, Water pollution sources, Gravimetric analysis, Mass spectrometry.

The organic materials in fine-grained Delaware estuary bottom sediment were determined by a combination of the electron microscope, mass spectrometer, chemical techniques, and thermal methods. Amorphous diatoms were identified by scanning electron micrographs, and were quantitatively determined by differential caustic leach methods. Amorphous hydrous iron compounds were determined by the sodium dithionite method. An especially effective combination of techniques to evaluate the pyrite, organic matter, and anthracite coal in the sediment was the use of differential thermal analysis, thermogravimetric analysis, and the mass spectrometer. The anthracite coal occurred in negligible amounts north of the confluence of the Schuylkill and Delaware Rivers and displayed progressive dispersal southward in the estuary. The coal had essentially a point source in the Schuykill River watershed that drains the anthracite coal fields of Pennsylvania. The greater amount of organic matter found in the vicinity of larger cities was attributed largely to sewage. Amorphous opaline diatoms were generally best represented in the more organic-rich sediment. Amorphous iron compounds appeared more abundant in the sediment in proximity to acid effluent discharge from industry. (See also W74-07225) (Knapp-USGS)
W74-07241

PROCESSES AFFECTING GAS DISTRIBUTIONS IN ESTUARINE SEDIMENTS,
Alaska Univ., College. Inst. of Marine Science.
W. S. Reeburgh.
In: Environmental Framework of Coastal Plain Estuaries; 18th Annual Meeting of Southeastern Section of the Geological Society of America, April 10-11, 1969, Columbia, S C: Geological Society of America, Inc, Memoir 133, p 383-389, 1972. 6 fig, 6 ref. AEC contract AT(30-1)-3497.

Descriptors: *Water chemistry, *Chesapeake Bay, Carbon dioxide, Nitrogen, Bubbles, Methane, Argon, Hydrogen sulfide, Mixing.
Identifiers: *Dissolved gases.

Summer and winter depth distributions of Ar, N2, CH4, total CO2, and total H2S were obtained at two stations in Chesapeake Bay. The data indicate that CH4 escapes the sediments as bubbles, stripping Ar and N2 from the sediments. Total CO2 increases to concentrations greater than 1,000 milliliters per liter with depth, and pH remains constant at about 7. Low and uniform total H2S concentrations indicate removal of sulfur as iron sulfides. The absence of CH4 in the upper 25 centimeters of these sediments and the presence of Ar and N2 in concentrations similar to the overlying water indicate mixing to at least this depth (See also W74-07225) (Knapp-USGS)
W74-07242

TEXTURE AND ORGANIC CARBON CONTENT OF BOTTOM SEDIMENTS IN SOME ESTUARIES OF THE UNITED STATES,
Middlebury Coll., Vt.
D. W. Folger.
In: Environmental Framework of Coastal Plain Estuaries; 18th Annual Meeting of Southeastern Section of the Geological Society of America, April 10-11, 1969, Columbia, S C: Geological Society of America, Inc, Memoir 133, p 391-408, 1972. 13 fig, 48 ref. USGS contracts 14-08-0001-11498 and 14-08-0001-11987.

Descriptors: *Sedimentation, *Estuaries, Provenance, Distribution patterns, Clays, Silts, Sands, Mineralogy, Sediment transport, Facies(Sedimentary), *Bottom sediments, Sediment sorting, United States, Sediment distribution, *Organic matter.
Identifiers: *Organic carbon.

Most estuaries, lagoons, and bays of the United States can be divided into four groups based on the distribution of sediment texture at the bottom. Differences between groups reflect the geologic, hydrologic, and bathymetric conditions under which the sediments were deposited. Areas representative of each group include Penobscot Bay, Maine, where widespread clay near the head grades seaward into silt and sand near the mouth; San Francisco Bay, California, where sand accumulated mostly in channels and silt and clay are widespread on tidal flats and shallow areas around the bay margin; Mississippi Sound, Mississippi and Alabama, where silt and clay cover most of the bottom and sand is abundant around the margins; and Pamlico Sound, North Carolina, where sand covers most of the bottom and silt and clay are limited to the deepest areas and channel bottoms. Organic carbon concentrations in bottom sediments are most relatively unpolluted estuaries (Penobscot Bay, Maine; Apalachicola Bay, Florida) are less than 5%; only where vegetal matter is abundant (Whitewater Bay, Florida) or where bottom waters are anaerobic (Deep Inlet, Alaska) are values of natural organic carbon commonly higher. Abundant organic pollutants in estuarine waters (Boston Harbor, Massachusetts; Charleston Harbor, South Carolina) are often relected by organic carbon concentrations in bottom sediments of 10% to 20%. W74-07243

BIOGEOCHEMICAL VARIABLES IN BOTTOM SEDIMENTS OF THE RAPPHANNOCK RIVER ESTUARY,
South Carolina Univ., Columbia. Coll. of Arts and Sciences.
B. W. Nelson.
In: Environmental Framework of Coastal Plain Estuaries; 18th Annual Meeting of Southeastern Section of the Geological Society of America, April 10-11, 1969, Columbia, S C: Geological Society of America, Inc, Memoir 133, p 417-451, 1972. 14 fig, 1 tab, 21 ref.

Descriptors: *Bottom sediments, *Estuaries, *Virginia, *Biochemistry, Stratigraphy, Biodegradation, Organic matter, Oxidation-reduction potential, Salinity.
Identifiers: Biogeochemistry, *Rappahannock estuary.

A transition from undifferentiated mud to estuarine sediment occurs in the bottom of the Rappahannock River estuary, Virginia, between the sediment-water interface and 100 centimeters in depth. The sediment profiles and their chemical properties respond to a dynamic equilibri between sedimentation rate depositional rate organic detritus, and microbiological activity T equilibrium is influenced by the gene bathymetry and intensity of physical proces near the bottom, the salinity and ventilation of bottom water, the composition of organic detrit and sediment compaction processes such as watering and gas ebullition Below 50 centimet in depth, Eh typically becomes positive In lower estuary, less intense physical process greater water depths and higher salinities ca higher rates of microbial activity. The chemi properties of estuarine sediment respond to t biological, chemical, and physical forces in th environment, and the particular expression profile development at any location tends reflect a dynamic equilibrium between the forces. RECENT ESTUARINE SEDIMENT HISTOR OF THE ROANOKE ISLAND AREA, NORT CAROLINA,
East Carolina Univ., Greenville. Dept. of Geolog
M P O'Connor, S R Riggs, and D Winston
In Environmental Framework of Coastal Pla Estuaries; 18th Annual Meeting of Southeaste Section of the Geological Society of Americ April 10-11, 1969, Columbia, SC: Geologic Society of America, Inc, Memoir 133, p 453-46 1972 6 fig, 1 tab, 6 ref.

Descriptors: *Sedimentation, *Erosio *Estuaries, *North Carolina, Water circulatio Barrier islands, Beaches, Sediment load, Strea flow, Atlantic Coastal Plain, Currents(Wate Sediment transport.
Identifiers: *Roanoke Island(NC).

Estuarine sediments from Croatan, Roanoke, a northernmost Pamlico Sounds in The Roanok Island area of North Carolina demonstrate com plex patterns of deposition and erosion. The sed ments reflect the dynamic interplay between t freshwater and saltwater systems, as controlled b the shifting barrier island inlets from the Atlant Ocean and the freshwater discharge from th mainland. During recorded history, and prior t 1817, inlets adjacent to or north of Roanoke Islan were continuously open. During this time most o the Roanoke Island area was characterize predominantly by sediment deposition within clear, saline, and productive estuarine system ha ing a diverse benthic marine fauna. With the clo ing of the last of the northern inlets in 1817, th discharge from the Albemarle drainage syste was diverted around Roanoke Island, widenin and deepening Croatan Sound, and producing highly variable, turbid, brackish water enviro ment characterized by a restricted benthic faun Today, Croatan Sound is characterized in the cen tral portions by active scour that exposes pr Holocene peats and fossiliferous fine sands, ero sion of the Recent salt marshes and peat bed along the shorelines, and slow deposition of ver fine and fine-grained sediments over much of th rest of the area. Northermost Pamlico Sound i characterized by a shifting erosional-deposition regime to which fine-grained sand is supplied b the tidal currents of Oregon Inlet. Roanoke Soun is characterized primarily by a depositional regim in which fine sand, derived from the Atlanti system by wind action and storm washover, is ac tively filling the shallow sound. EROSIONAL AND DEPOSITIONAL ESTUARINE 'TERRACES,' SOUTHEASTERN UNITED STATES,
Georgia Univ., Sapelo Island. Marine Inst.
J. H. Hoyt.
In: Environmental Framework of Coastal Plain Estuaries; 18th Annual Meeting of Southeastern Section of the Geological Society of America

ril 10-11, 1969, Columbia, S C: Geological ciety of America, Inc, Memoir 133, p 465-473, 2. 5 fig, 32 ref.

scriptors: *Erosion, *Sedimentation, stuaries, *Terraces(Geologic), Sea level, position(Sediments), Scour, Surf, omorphology, Surfaces, Water levels, outheast U.S.

er the formation of barrier islands, sediment umulation in lagoons produces to major sur- es which form concurrently at the base and top estuarine deposits. These surfaces range from s than one-half to more than 30 km wide, and separated by as much as 30 m of estuarine sedi- nt. The basal surface is erosional and is shaped the shifting estuarine channels. Relief may be nuch as several meters; the surface is undulato- and slopes gently seaward. Basal estuarine osits are clayey sands and gravels. Gravels nmonly are angular, and cut and fill structures cross-stratification are abundant. The upper t of the estuarine deposits, the salt marsh sedi- nts, are mainly clayey sands and silts, com- nly cut by channels. The surface at the top of estuarine sequence is depositional, the result agoonal filling which converts this area to a salt rsh. The upper limit of deposition is spring high e. Relief may be several tens of meters as a ilt of channels. Only the depositional surrface ld be considered a morphological terrace; how- r, during late stages of barrier island-estuarine velopment, when sediment supply may be insuf- ent to maintain the barriers, marine erosion y produce a wave cut and fill terrace. This type terrace is rare in Quaternary deposits of theastern United States because of modifica- n and burial during the subsequent formation of two major estuarine surfaces. MARINE GEOLOGY AND ESTUARINE HISTORY OF MOBILE BAY, ALABAMA: PART 1. CONTEMPORARY SEDIMENTS,
Florida State Univ., Tallahassee. Dept. of Oceanography.
J. J. Ryan, and H. G. Goodell.
In: Environmental Framework of Coastal Plain Estuaries; 18th Annual Meeting of Southeastern Section of the Geological Society of America, April 10-11, 1969, Columbia, S C: Geological Society of America, Inc, Memoir 133, p 517-554, 1972. 17 fig, 8 tab, 51 ref.

Descriptors: *Sedimentation, *Estuaries, *Alabama, Gulf coastal plain, Sedimentation rates, Sediment distribution, Bottom sediments, Water circulation, Suspended load, Sediment sorting, Mineralogy, Clays, Sands, Silts.
Identifiers: *Mobile Bay(Ala).

An annual average of 4.3 million metric tons of suspended sediment are being transported into the Mobile Bay estuary. The dominant terrigenous clastics are quartz, kaolinite, and montmorillonite. Circulation patterns within the estuary are controlled primarily by river discharge, tides, and geometry of the bay. Comparisons of the bathymetry of 1847 ti 1851 and 1960 to 1962 indicate an average shoaling of 56 cm per century. Aporoximately 1.3 million metric tons of suspended sediment is currently bypassing the estuary of being deposited to the south and west of the tidal inlet. Clean quartz sands occur around the periphery of the bay generally in water depths less than 2 m. Most of the bay bottom sediments consist of silty clays and clays. Grain size decreases and sorting increases downbay and to the southeast. Higher montmorillonite content near the bay-head delta and increasing kaolinite content toward the southeast in Bon Secour Bay are attributed to sediment dispersal patterns, differences in sedimentation rates, and to increase in kaolinite content in the suspended river sediments over the historic period, the result of the development of agriculture within the drainage basin. The distribution and ages of buried oyster reefs indicate a progressive downbay migration in response to progradation of the bay-head delta. (See also W74-07225) (Knapp-USGS)

EFFECT OF INCREASING DEPTH ON SALINITY IN THE JAMES RIVER ESTUARY,
Virginia Inst. of Marine Science, Gloucester Point.
M. M. Nichols.
In: Environmental Framework of Coastal Plain Estuaries; 18th Annual Meeting of Southeastern Section of the Geological Society of America, April 10-11, 1969, Columbia, S C: Geological Society of America, Inc, Memoir 133, p 571-589, 1972. 11 fig, 2 tab, 15 ref.

Descriptors: *Estuaries, *Water circulation, *Sedimentation, *Water control, *Environmental effects, Dams, Dredging, River training, Flood control, Levees, Reservoir operation, *Salinity, Streamflow, Hydraulic models.
Identifiers: *James River Estuary(Va).

The effects of channel deepening on the salinity and density flow in the James River estuary, Virginia, were studied to predict changes that might affect oyster production. A hydraulic model with 1:1,000 horizontal and 1:100 vertical scales was employed to integrate three-dimensional changes in salinity and velocity through reaches of variable bottom geometry. After natural characteristics of the tide, current, and salinity were reproduced in the model, tests were run at three levels of steady river inflow, before and after a 3-meter channel deepening. Deepening produced the greatest salinity change in the middle estuary, where the major cut was performed. The lower water layer located mainly in the channel became saltier by about 0.5 part per thousand, whereas the upper layer over the oyster shoals became fresher by about 0.2 part per thousand. Changes in bottom water salinity were greatest at intermediate inflow and least at very low inflow. High freshwater inflow created the greatest change in vertical salinity gradient. With greater stratification, tidal velocities were less effective in promoting vertical mixing between lower and upper estuarine water layers, and the net volume transport in each layer was reduced. Since the changes in salinity and flow pattern due to channel deepening were small, no effects inimical to the oyster fishery were predicted. Similarly the prospective changes in sedimentary regime will not offset the beneficial effects of the proposed deepening project. (See also W74-07225) (Knapp-USGS)
W74-07250

HYDROLOGY OF THE DUNES AREA NORTH OF COOS BAY, OREGON,
Geological Survey, Portland, Oreg.
J. H. Robison.
Open-file report, 1973. 62 p, 30 fig, 2 plate, 15 tab, 23 ref, append.

Descriptors: *Hydrogeology, *Surface-groundwater relationships, *Oregon, Water levels, Anisotropy, *Dunes, Coasts, Analog models, Withdrawal, Water yield, Safe yield, Water resources development.
Identifiers: *Coos Bay(Oreg).

Hydrology of a 20-sq-mi area of dunes along the central Oregon coast was studied. The area is underlain by 80 to 150 feet of Quaternary dune and marine sand which overlies Tertiary marine clay and shale. Groundwater for industrial and municipal use is being withdrawn at a rate of 4 million gallons per day. Plans to withdraw as much as 30 million gallons per day are limited by the prospect of excessive lowering of levels in shallow lakes near the wells, and possibly seawater intrusion, if water-level gradients are reversed. At the present stage of development there are 18 production wells, each capable of producing 200-300 gallons per minute from the lower part of the sand deposits. Except for thin layers of silt, clay, and organic matter, the deposits of sand are clean and uniform; horizontal permeability is 100 times the vertical permeability. Because of the low vertical permeability, drawdown cones are not evident in the upper part of the aquifer adjacent to the wells. However, present pumping lowers general water levels in the lakes and the shallow groundwater zone by several feet. A two-layer electric analog model was built to analyze effects of present and projected development as well as any alternate plans. Model results were used to develop curves for short-term prediction of water levels. (Knapp-USGS)

SIZE AND SHAPE SORTING IN A DUTCH TIDAL INLET,
Groningen Rijksuniversiteit (Netherlands). Geological Inst.
A. M. Winkelmolen, and H. J. Veenstra.
Sedimentology, Vol 21, No 1, p 107-126, February 1974. 8 fig, 1 tab, 25 ref.

Descriptors: *Sediment sorting, *Particle size, *Particle shape, *Tidal waters, Deltas, Bottom sediments, Sediment transport, Littoral drift, Currents(Water).
Identifiers: Tidal flats, *Netherlands.

A tidal inlet system with an outer tidal delta, situated between two barrier islands along the north coast of Holland was studied for size and shape

sorting. Sand types can be distinguished using size data and distinct grain populations can be recognized. Graphs of shape values, plotted against the size intervals of samples also reveal the presence of different grain populations, together with their genetical significance. There is no sand transport directly from island to island. Sand of sizes up to 400 micrometers enters the tidal inlet, is sorted out in the tidal flat area and partly re-enters the sea via the outer tidal delta. On the delta, the sediment is split up again in different populations. A lag deposit is left behind on the frontal part of the delta. The rest of the sand either re-enters the tidal inlet cycle or contributes to the beach building of the next island. In the offshore environment, sand movement by wave-induced currents is restricted to the shallow zone. In deeper water, part of the sediment is relatively immobile and has preserved inherited characteristics from the early Holocene transgressive phase. In front of Ameland, fossil barrier-face deposits are present, off Schiermonnikoog the sea floor contains old tidal channel deposits. (Knapp-USGS)

SEASONAL ABUNDANCE AND DISTRIBUTION OF JUVENILE BLUE CRABS IN CORE SOUND, N.C. 1965-1966,
National Marine Fisheries Service, Beaufort, N. C. Atlantic Estuarine Fisheries Center.
H. Judy.
Chesapeake Sci. Vol 14, No 1, p 51-55, 1973. Illus.
Identifiers: Callinectes-Sapidus, *Commercial fishery, *Crabs(Blue), Distribution, Juvenile, Migration, *North Carolina(Cove Sound), *Seasonal.

Studies were made in Core Sound, North Carolina to determine the abundance and distribution of juvenile blue crabs, Callinectes sapidus, and their subsequent relation to the commercial fishery. Estimates of juvenile abundance were based on catches of small crabs in the marsh creeks bordering Core Sound. Young-of-the-year blue crabs (2.5-5.0 mm) begin to enter Core Sound estuary in early Oct. These small crabs move through the open waters of the sound and bays into the small marsh creeks and remain there until the following spring. At this time (April-May) the juvenile crabs move into the bays and sound proper where they remain to maturity. Catch and effort statistics from Core Sound commercial crab fishery were collected from Nov. 1964 through June 1968. Landings of approximately 680,000 kg annually constitue the fishery. --Copyright 1973, Biological Abstracts, Inc.

BIOLOGICAL INVESTIGATIONS OF NOXIOUS COELENTERATES AND CTENOPHORES IN COASTAL NORTH CAROLINA,
North Carolina Univ., Morehead City. Inst. of Marine Sciences.
R. J. Schwartz, and A. F. Chestnut.
Available from the National Technical Information Service as COM73-11128, $7.00 in paper copy, $1.45 in microfiche. National Marine Fisheries Service, Washington, D.C., Report NOAA-73052109, April 1973. 96 p, 32 fig, 28 tab, 65 ref, append. JF-2-9. PL 88-309.

Descriptors: *Jelly fish, *Distribution, *North Carolina, *Coasts, Water temperature, Salinity, Systematics, Fish, Economic impact, Bibliographies.
Identifiers: *Coelenterates, *Ctenophores, Albermarle Sound(N.C.), Pamlico Sound(N.C.).

Preliminary to attempting to control or eliminate jellyfish and other such pests, in late 1971 a project was devised to determine what species of jelly-fishes and ctenophores inhabit North Carolinian waters, at what seasons, at what depths, and in what abundance. The study encompassed their life histories and needs, what associations of species and environment triggered or permitted their presence, and the effect upon man and his utilization of the area. The coastal estuarine and marine waters of North Carolina were divided into five sampling areas where the past geologic history, the physical and chemical features, temperature and salinity profiles, circulation and current patterns, and invertebrate fauna were studied. Extensive graphs, maps, and tabulations of their occurrences are included. Seven species of jelly-fishes and two ctenophores were encountered, each with a seasonal preference as to occurrence, water temperature, salinity, and depth distribution. A bibliography of coelenterates that occur in North Carolina and adjacent waters containing 94 references is appended. (Jones-Wisconsin)

INVESTIGATION OF THE BIOLOGY AND CONTROL OF NOXIOUS COELENTERATES OCCURRING IN THE COASTAL WATERS OF PUERTO RICO,
Puerto Rico Univ., Mayaguez. Dept. of Marine Sciences.
C. E. Cutress.
Available from the National Technical Information Service as COM73-11095, $4.25 in paper copy, $1.45 in microfiche. National Marine Fisheries Service, Washington, D.C. Report No. NOAA 73052118, July 1972. 40 p, 6 fig, 8 tab, 4 plates, 2 ref. JF-2-6. PL 88-309.

Descriptors: *Jelly fish, *Coasts, *Puerto Rico, Safety, Life history studies, Distribution, Beaches, Public health, Systematics, Mangrove swamps.
Identifiers: *Coelenterata, Cubomedusae.

Coelenterates long have been troublesome to fishermen and swimmers off the Puerto Rican coasts. Stingings occur regularly but seasonally, and occasionally in epidemic proportions at swimming beaches. Eight jellyfish species are at one time or another responsible for injuries to swimmers but three species are the major offenders. Extensive barrier coral reefs and mangrove lagoons off coastal Puerto Rico are the habitats of sessile stages of nearshore jellyfish species, some of which are bothersome to bathers. The pattern of occurrence and distribution of the principal stinging species seems to be correlated with nearshore hydrographic conditions and proximity of the beaches to mangrove lagoons suggesting that the problem in such instances might be alleviated by slight alterations of a physical feature of the shore. Investigation was begun with preliminary surveys of swimming beaches, marinas, and fishing ports allowing an insight into the nature and extent of the problem. Jellyfish collected during 1969 to 1971 are listed and some illustrated. Life histories of several are described. Of the 32 known jellyfish fauna off Puerto Rico, some are weak stingers while others, while rare, are capable of causing injury. (Jones-Wisconsin)

PROCEEDINGS 2ND ANNUAL TECHNICAL CONFERENCE ON ESTUARIES OF THE PACIFIC NORTHWEST.
Available from the National Technical Information Service as COM-73-11310; $4.25 in paper copy, $1.45 in microfiche. March 16-17, 1972. Oregon State Univ., Corvallis. Engineering Experiment Station Circular No 44, (1972). 111 p, 45 fig, 12 tab, 71 ref.

Descriptors: *Estuaries, *Conferences, *Pacific Northwest U.S., Migration, Oregon, Anadromous fish, Mathematical models, Primary productivity, Fjords, Ecosystems, Alaska, Tidal waters, Flow, Retention, Winds, Shore protection, Breakwaters, Economics, Water pollution control, Navigation, Protection, Zoning, Management.

Sensitivity of estuaries signals need for better understanding of estuarine processes but their complexity makes simplistic solutions unrealistic and detailed solutions difficult. Papers presented at this conference enhance the knowledge of estuarine ecosystems and of their physical properties--a prerequisite to intelligent management of estuarine and coastal areas. The following subjects are covered by contributors: Some estuarine factors influencing ascent of anadromous cutthroat trout in Oregon, A strategy for modeling primary production in stratified fjords, An ecosystem study in the inside passage of southeastern Alaska, Difficulties ahead for Oregon regarding estuary

regulations, control and protection, The National Shoreline Study, Physical modeling of residence times in tidal basins, The influence of wind on the surface waters of Alberni Inlet, State of the art of floating breakwaters, Laws and regulations of pollution and navigation in Pacific Northwest estuaries, Technical and economic issues in water quality management in Yaquina Bay, and Pacific Northwest coastal zone management as it relates to estuary protection. The development of policies and standards based on the carrying capacities of the natural resources should insure their protection. (See W74-07492 thru W74-07500) (Jones-Wisconsin)

SOME ESTUARINE FACTORS INFLUENCING ASCENT OF ANADROMOUS CUTTHROAT TROUT IN OREGON,
Oregon State Game Commission, Corvallis.
R. D. Giger.
In: Proceedings 2nd Annual Technical Conference on Estuaries of the Pacific Northwest, March 16-17, 1972. Oregon State Univ., Corvallis (Engineering Experiment Station Circular No 44), p 18-29 (1972). 9 fig, 13 ref.

Descriptors: *Estuaries, *Migration, *Anadromous fish, *Oregon, Geomorphology, Salinity, Water temperature, Distribution, Salmonids, Sport fishing, Dredging, Salmon, Depth, Cutthroat trout.
Identifiers: Alsea River(Ore), Siuslaw River(Ore), Nestucca River(Ore).

Study of coastal cutthroat trout, Salmo clarki clarki, on the north-central Oregon coast was directed primarily toward improvement of angler catches of hatchery-reared cutthroat through the manipulation of liberation times. To determine the timing and location of the estuary catch, information on fish distribution and movement was gathered and related to gross measurements of estuary geometry, salinity, and temperature. Results of estuary studies centering on the Alsea River are reported. Approximately 2000 sea-run cutthroat were captured and marked. More than 300 tags from these fish were subsequently returned providing information on timing of migration, estuary movements, length of estuary residence, and distribution and intensity of sport catch. Angler catch sampling gave additional information on food habits and fish movements. High temperatures in upper estuary areas of some coastal rivers prevent passage of fish that might otherwise migrate further upstream; as a result, ascending fish congregate in estuary areas of suitable temperature and depth immediately downstream until water temperatures moderate in the fall, thus the extended period of summer residence is advantageous to the estuary sport fisheries. Alteration of temperature regimes, depths, or perhaps other features could change fish distributional patterns and ultimately affect the success of fisheries. (See also W74-07491) (Jones-Wisconsin)

PHYSICAL MODELING OF RESIDENCE TIMES IN TIDAL BASINS,
Alaska Univ., College. Dept. of Ocean Engineering.
T. Carstens.
In: Proceedings 2nd Annual Technical Conference on Estuaries of the Pacific Northwest, March 16-17, 1972. Oregon State Univ., Corvallis (Engineering Experiment Station Circular No 44), p 59-65 (1972).

Descriptors: *Model studies, *Tidal effects, *Basins, *Retention, Fjords, Bathymetry, Prototypes, Stratification, Diffusion, Circulation, Estuaries.
Identifiers: *Residence time.

The memory of a water body depends on its topography and on the energy input. The memory is most conveniently described by a single parameter--residence time. The average residence time, defined as the ratio of total basin volume to the average throughflow, has only a limited value if the actual flux of renewal water does not flush the entire basin. Examples are given to demonstrate the need for a more detailed answer to the question of residence time than its gross average. It appears useful and necessary to break down the basin in sub-basins according to realistic estimates of the local residence time. Of particular interest in the feasibility of small-scale physical models are the possibilities of obtaining residual tidal currents quickly and inexpensively, compared with in situ observations, and simulating residence times in stratified basins. Restrictions on the method are that the tidal range should be appreciable and that some information is available on the vertical eddy diffusion coefficient from in situ tracer experiments. The small-scale physical model is not a high-precision tool, however its chief advantage is that it displays local closed circulations, which are ignored in the present generation of mathematical models. W74-07496

THE INFLUENCE OF WIND ON THE SURFACE WATERS OF ALBERNI INLET,
British Columbia Univ., Vancouver. Dept. of Physics.
D. M. Farmer.
In: Proceedings 2nd Annual Technical Conference on Estuaries of the Pacific Northwest, March 16-17, 1972. Oregon State Univ., Corvallis (Engineering Experiment Station Circular No 44), p 66-73 (1972). 9 fig, 5 ref.

Descriptors: *Winds, *Surface waters, *Inlets(Waterways), *Stratification, Model studies, Bays, Fjords, Currents(Water), Estuaries, Energy, Conductivity, *Canada.
Identifiers: *Alberni Inlet(Vancouver Island).

Strong winds occur along the steep-sided inlets of the Pacific Northwest with a profound effect on the density structure of their highly stratified surface waters. Alberni Inlet, Vancouver Island was chosen for the experiment, timed to coincide with a Canadian Hydrographic Service current and tide survey during the late winter and spring of 1971. Special instruments were built to measure conductivity. Wind was measured using four recording anemometers mounted 2 meters above the ground on exposed points. Observations of wind, current, and surface water layer thickness in Alberni Inlet have helped elucidate some of the ways in which the system responds to a surface stress. Much of the wind energy is diurnal and a close coupling exists at this frequency between wind and current at a depth of 2 meters. On the other hand, most of the energy associated with changes in the surface water layer thickness is of significantly lower frequency. A simple two-layer frictional model is able to explain much of what is observed and can be used to predict the surface layer thickness on the basis of measured wind speeds. TAXONOMIC POSITION OF TWO LUMBRINERIS SPP.,
Canterbury Univ., Christchurch (New Zealand). Dept. of Zoology.
G. A. Knox, and K. M. Green.
New Zealand Journal of Marine and Freshwater Research, Vol 7, No 3, p 247-252, September 1973. 2 fig, 8 ref.

Descriptors: *Worms, *Systematics, *Annelids, Speciation, *Australia.
Identifiers: *Lumbrineris, Polychaetes, Animal morphology, *New Zealand.

Two species with unusual features not typically seen in the Lumbrineridae have recently been found: one, identified as Lumbrineris mucronata, is from the north-east coast of Australia, and the other, identified as L. sulcaticeps, is from the south-east coast of New Zealand. Both species are unusual in that maxilla IV is multidentate. In addition, the entire surface of the plate is covered by small, hard projections, thus forming what appears to be a rasping plate; these projections give the pale-colored plate a speckled appearance. The posterior hooks of both species are simple, and basically bidentate. The hoods of these hooks are almost circular. (Mortland-Battelle)

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

SELF CLEANING, TUBULAR SOLAR STILL,
ESB, Inc., Philadelphia, Pa. (assignee).
J. P. Coffey, and J. C. Duddy.
U.S. Patent No 3,785,931, 3 p, 4 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 918, No 3, p 1163, January 15, 1974.

Descriptors: *Patents, *Distillation, *Desalination, *Solar stills, Water treatment, Solar radiation, *Evaporation, *Condensation, Separation techniques, Water quality control.

A microporous evaporator having a dark exterior surface is located within but not touching a concentric tube of clear material serving as a condensing surface. Raw water is fed to the top of the porous evaporator and slowly percolates down to the bottom of the member to a waste water drain.

Sunlight hitting the dark evaporator surface causes water to evaporate giving off pure water vapor. The water vapor is condensed on the inside of the clear tube. As condensed water collects on the clear tube, it runs down to be collected as purified water. The evaporator and condenser tube are normally located in a vertical or near vertical position. For tropic installation, simple reflectors direct the sun's rays on one or more tubes. For operation at higher latitudes, the tubes can be positioned so as to be more or less perpendicular to an average sun ray taking account of latitude declination and times of sunlight, or reflectors can be so directed. (Sinha - OEIS)

PLANNING AND OPERATIONAL STUDIES IN THE INTEGRATED USE OF DESALINATION. CASE STUDIES FOR CYPRUS AND JERSEY,
Water Research Association, Marlow (England).
P. A. Mawer, and T. Wyatt.
Desalination, Vol 13, No 3, p 333-342, December 1973. 7 fig, 1 tab, 2 ref.

Descriptors: *Water supply development, *Desalination, Desalination plants, *Long-term planning, Operation and maintenance, *Simulation analysis, Water quality control, Evaluation, Reliability, Optimization, Irrigation, Water demand, Surface waters, Systems analysis, Mathematical models.
Identifiers: *Cyprus, *Great Britain(Jersey-Channel Islands), Least cost, Control rules.

Two case studies are described relating to the integrated use of desalination with conventional water resources. The studies contrast the different requirements of a long-term planning study with those of an assessment of existing system operation. The first study is concerned with an examination of the potential role of desalination in the long-range development of Cyprus' water resources. Special features of this research are the strong influence of irrigation demands and the need to derive plans which are flexible against an only partially-defined future. The importance of extended periods of planning and preparatory plant operation is emphasized. The second study deals with the 1.5 mgd MSF plant operated by the Jersey New Water Works Company (Jersey, Channel Islands), where the objective is to maintain overall supply reliability at minimum cost. Greater attention is given to recognition of the detailed system constraints. The plant is operated in conjunction with an unusually complex system of surface water resources which present special difficulties in the optimization of control rules for the desalination plant. Discussed is a detailed model for simulating the system. Results, provided in the form of control rules, are also discussed. In both study cases, the most important need is to recognize the desalination plant as a component of the total water supply system. (Bell-Cornell)

MODEL TESTS WITH THIN SHEETS TO REDUCE EVAPORATION,
Research Inst. for Water Resources Development, Budapest (Hungary).
A. F. Thoma.
Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol 99, No IR2, Proc. Paper 9779, p 117-131, June 1973. 8 fig, 7 tab, 9 ref, 2 append.

Descriptors: *Evaporation control, *Monomolecular films, *Water conservation, *Air temperature, Lakes, Reservoirs, Irrigation, Evaporation, Evaporation pans, Evaporimeters, On-site investigations, Plastics, Surface waters.

The efficiency of a thin suspended sheet in reducing evaporation was tested to determine the relationship between evaporation reduction and the height of the sheet above the water. Sheet (S1) consisted of a 0.3 mm thick plastic sheet, while sheet (S2) was prepared from one 2 mm thick plywood covered on both sides with oil. All tests were carried out under controlled laboratory conditions. Results showed that evaporation reduction may be achieved by using a thin sheet placed above the water surface, but not necessarily in contact with it; and the higher the air temperature, the greater the amount of evaporation reduction. The evaporation reduction effect was 37.3 percent in the open air model test. Future tests should include a greater number of independent variables to more closely approximate naturally occurring processes. (Mastic-Arizona)

3C. Use Of Water Of Impaired Quality

EFFECT OF GYPSUM IN REDUCING BORON HAZARD OF SALINE WATERS AND SOILS,
Central Soil Salinity Research Inst., Karnal (India).
I. C. Gupta, and H. Chandra.
Annals of Arid Zone, Vol 11, Nos 3 and 4, p 228-230, Sept. and Dec. 1972. 2 tab, 1 ref.

Descriptors: *Gypsum, *Boron, *Soil treatment, *Saline soils, *Saline water, Sodium, Soil water, Arid lands, Soil amendments, Land management.

Saline water, a common problem in arid zones, is unsatisfactory for agriculture because of high osmotic pressure, high sodium hazard, or high boron hazard. While gypsum has been known as a treatment for sodium hazard, this study has found it also reduces the boron hazard of saline water and saline sodic soil. Eighty percent dose of gypsum reduced the toxicity of sodic soil while one percent was sufficient to have the same effect on water. The gypsum used must be boron-free. (Muller-Arizona)

AN ECONOMIC ANALYSIS OF SELECTE AGRICULTURAL USES OF WARM WATER I THE PACIFIC NORTHWEST RESULTIN FROM ELECTRIC POWER GENERATION,
Washington State Univ., Pullman. Dept. Agricultural Economics.
R. W. Johns, R. J. Folwell, R. T. Dailey, and M. E Wirth.
Journal of Environmental Quality, Vol 2, No 2, 224-228, 1973. 1 fig, 4 tab, 16 ref.

Descriptors: *Water reuse, *Economic feasibility *Heated water, Pacific Northwest U.S., Coolin water, Agriculture, Aquiculture, Greenhouse Thermal pollution.

Between 1970-1990 85% of all electricity generate will require cooling water. Three uses of this coo ing water are examined for the Pacific Northwes to determine whether the warm water could b used to aid fish growth, under the limit established by the reduced water quality caused b the heating, and the economics of raising carp an catfish. It is estimated that carp, used in variou animal meals, would require a price of $59.52 me ric ton compared to the existing price of $55-60 t encourage investment. The 1970-71 price of ca fish--26 cents lb--exceeds the required investmen price of 20 cents lb to raise catfish in a 1500 acr cooling pond. The market price for catfish, how ever, has declined over the past five years an declines are expected to continue. The second use heating greenhouses was also found to be a mar ginal investment. Use of the cooling water for soi warming systems is limited by high initial invest ment cost, yield responses, and prices. A soi warming technique found to be profitable for 20 o 29 crops examined at installation costs o $2000/acre was found profitable only for 1 out o 29 vegetable crops when installation costs in creased to $5000/acre. THE GEOLOGY OF WATER: THE LIMITING FACTOR IN URBAN DEVELOPMENT,
Indiana Purdue Univ., Indianapolis. Dept. of Geology.
A. Mirsky.
Proceedings of the Indiana Academy of Science, Vol 82, p 310-317, 1972. 3 fig, 1 tab, 5 ref.

Descriptors: *Water resources, *Water requirements, *Urban hydrology, *Human population, Surface waters, Subsurface waters, Aquifer characteristics, Water quality control, Geomorphology, Hydrogeology, Urbanization.

Of the several factors which bear on the initial establishment and later development of an urban center, the availability of adequate local water supplies is most important. The amount of available water includes that which is already obtained from surface sources plus underground aquifers, as well as local water reserves which can readily be estimated from the geological setting. If any expanding urban area, such as Indianapolis, is to avoid major water crises and the attendant deterioration in the quality of metropolitan life, consideration must be given to setting a population limit within the capacity of the local water resource, and directing excess population elsewhere. IN-PLANT, CONTINUOUS HOT-GAS BLANCHING OF SPINACH,
National Canners Association, Berkeley, Calif. Western Research Lab.
J. W. Ralls, H. J. Maagdenberg, N. L. Yacoub, M. Zinnecker, and D. Homnick.
J Food Sci. Vol 38, No 2, p 192-194. 1973.
Identifiers: Ascorbic acid, *Blanching(Hot-gas), Chemical oxygen demand, Continuous, Reduction, *Spinach, Vegetables, Waste water, *Food canneries, Pilot plants.

A new blanching system for vegetables (hot-gas blanching) which showed promise in pilot plant studies was tested in a commercial spinach cannery. The hot-gas blancher was operated at 93-121 degrees C with a spinach residence time of 108 sec. Four tons of washed spinach was hot-gas blanched and returned to the commercial filling line; the volume of wastewater produced was 1% of that from the commercial blancher (per ton blanched). A reduction of 96% in COD (chemical oxygen demand) was achieved by substituting hot-gas blanching for hot-water blanching. Differences were found in the flavor, head-space gas composition and ascorbic acid content of hot-gas blanched spinach compared to commercial canned samples.--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF CONTOUR FURROWS AND CONTOUR BUNDS ON WATER CONSERVATION IN GRASSLANDS OF WESTERN RAJASTHAN,
Central Arid Zone Research Inst., Jodhpur (India).
W. Ullah, A. K. Chakravarty, C. P. Mathur, and N. S. Vangani.
Annals of Arid Zone, Vol 11, Nos 3 and 4, p 169-182, Sept and Dec 1972. 1 fig, 5 tab, 17 ref.

Descriptors: *Contour furrows, *Soil treatments, *Grasslands, *Soil moisture, Soil management, Percolation, Infiltration, Moisture availability, Precipitation(Atmospheric), Induced infiltration, Retention, Soil water, Storage capacity, Water storage, Cultivation, Range grasses, Range management, Forage grasses, Soil-water-plant relationships.
Identifiers: *India(Rajasthan).

Four study areas were established in Rajasthan, India, to examine the effect of contour furrows and contour bunds on soil moisture conservation and forage yield from rangelands. These treatments increased forage production from 14 to 180 percent in 1966 and from 4 to 37 percent in 1967. The treatment indicated comparatively higher moisture percentages in different areas. Key forages and perenial grasses are identified and the effects of the treatment on their yield are discussed. The contour furrowing essentially retards the drainage from precipitation until it has a chance to infiltrate into the soil horizon. In this way water which would otherwise be lost in runoff will be stored in the soil for the use of the forage grasses. The treatment is recommended for yield augmentation in dry rangeland regions such as the study areas. (Muller-Arizona)

EFFECT OF SEEDING RATES AND ROW SPACINGS ON FODDER PRODUCTION OF MOTH BEAN (PHASEOLUS ACONITIFOLIUS),
Central Sheep and Wool Research Inst., Jaipur (India).
A. S. Faroda.
Annals of Arid Zone, Vol 11, Nos 3 and 4, p 183-186, Sept. and Dec. 1972. 1 tab, 2 ref.

Descriptors: *Forage legumes, *Planting management, *Soil-water-plant relationships, *Rates of application, Forages, Cultivation, Seeds, Plant growth, Application methods, Competition, Moisture availability, Soil water.
Identifiers: *Row spacing, *India(Rajasthan).

The seeding rates of 20 and 25 kg seed per hectare produced more green and dry vegetative material in moth beans than 15 kg seed per hectare, although the difference between the first two rates is negligible. Line sowing at a row spacing of 25 cm was better than broadcasting and line sowing at 50 cm row spacing. Since plant-to-plant distances were maintained uniformly, the yield in the wide row spacing case was probably lower because the distance between the plants in a row was less than the distance between rows and the competition of the plants within the row was intensified. The seeding and planting methods discussed above are believed to reduce excessive plant competition for water. (Muller-Arizona)

AGROCLIMATIC REGIONS OF RAJASTHAN,
Central Arid Zone Research Inst., Jodhpur (India).
A. K. Sen.
Annals of Arid Zone, Vol 11, Nos 1 and 2, p 31-40, March and June 1972. 2 maps, 1 tab, 14 ref.

Descriptors: *Climatic zones, *Regional analysis, *Agroclimatology, *Arid climates, Geographical regions, Semiarid climates, Meteorological data, Microclimatology, Agriculture, Micrometeorology, Weather, Crops, Available water.
Identifiers: *India(Rajasthan).

Various climatic elements, water availability factors and agricultural variables were employed in the classification and mapping of agroclimatic conditions in the Rajasthan dryland region of India. The six climatic variables were average and variational temperature, peak rainfall, rainfall to temperature relationship, climatic homogeneity and humidity. The indices used in defining the agricultural or crop component of the classification were geographic crop distribution, land use, crop yield and intensity, and the location and area of a specific crop. The availability of irrigation water and rainfall were also considerations. The region was found to be suitably divided into 5 larger macroclimatic zones and 10 smaller micro agro-climates. A table is presented in which each of the areas is described in detail with respect to climatic, irrigation, and land use conditions. This classification appears to be a useful tool in the regional agricultural planning for Rajasthan. (Muller-Arizona)
W74-07102

POPULATION, LAND USE AND LIVESTOCK COMPOSITION IN INDIA AND ITS ARID ZONE,
Central Arid Zone Research Inst., Jodhpur (India).
S. P. Malhotra, J. S. Rao, D. Goyal, and F. C. Patwa.
Annals of Arid Zone, Vol 11, Nos 1 and 2, p 116-127, March and June 1972. 4 tab, 5 ref.

Descriptors: *Regional analysis, *Water resources, *Land use, *Livestock, Arid lands, Regional development, Regional economics, Arid climates, Water resources development, Population, Human populations, Economics, Rural area, Land development, Land resources, Agriculture, Cereal crops, Cotton
Identifiers: *India(Rajasthan).

Ten percent of the land surface of India is classified as arid. Most of this is in the Rajasthan region which has a population of approximately 19 million. Mean annual rainfall is inversely correlated with population growth in the area but positively correlated to total population. Twenty-five percent or more of the arable wastelands of India are in the region. The crops are principally rainfed, but the incidence of irrigation is increasing. Wheat, barley, maize and cotton are the principal crops cultivated, with the region producing only a minor portion of the cereals crop of India but a significant part of the cotton. Approximately seven percent of the total livestock in India is raised in Rajasthan. Permanent pastures and grazing lands are available in the area. The development of available water resources and the identification of new ones is the key to the further development of the region. (Muller-Arizona)

STUDY ON THE PASTURE ESTABLISHMENT TECHNIQUE VI. EFFECT OF DIFFERENT SPACINGS AND WEEDINGS ON ESTABLISHMENT AND FORAGE PRODUCTION OF CENCHRUS CILIARIS LINN., LASIURUS SINDICUS HENR. AND PANICUM ANTIDOTALE RETZ UNDER ARID CONDITIONS,
Central Arid Zone Research Inst., Jodhpur (India).
A. K. Chakravarty, and C. M. Verma.
Annals of Arid Zone, Vol 11, Nos 1 and 2, p 60-66, March and June 1972. 2 fig, 1 tab, 5 ref.

Descriptors: *Water yield improvement, *Pasture management, *Plant growth, *Forage grasses, *Weeds, Arid lands, Weed control, Vegetation effects, Planting management, Seeds, Agronomic crops.
Identifiers: *India(Rajasthan).

Three species of forage producing perennial grasses are examined under various conditions of plant spacing and weeding. The grasses are Cenchrus ciliaris Linn., Lasiurus sindicus Henr. and Panicum antidotale Retz. Weeding once in the first year after establishment caused an increase in forage yield by 86, 120 and 284 percent respectively. The annual and perennial weeds causing the most problems are identified. The increase in forage production in attributed to the fact that the water formerly taken up by the weed is now available to the grass. Plant spacing did not significantly alter forage yield. Weeding seemed to be the predominant management variable, with two annual weedings offering the highest forage production. (See also W70-02554) (Muller-Arizona)

IRRIGATION AND SPRINKLER SYSTEM,
Clemar Mfg. Corp., Azusa, Calif. Assignee.
D. R. Bayer, L. M. Ritchie, and J. A. Rivens.
U.S. Patent No 3,787,728, 7 p, 6 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 918, No 4, p 1620, January 22, 1974.

Descriptors: *Patents, *Irrigation system, *Evaporation pans, *Sprinkler irrigation, *Environmental control, Rainfall, Frost, Winds, Heat, Equipment, Control systems, *Automation. Identifiers: Sensors.

In an automatic water system water solenoid valves at a plurality of stations or locations may be sequentially and selectively energerized in accordance with two selectable programs: an irrigation program or mode and an environmental program or mode. Push button switches permit transition from one mode to the other. Use is made of evaporation pans, heat, frost, wind or rain sensors which are remotely controlled to activate the selected modes. The stations selected for watering in the irrigation mode may be different from those selected in the environmental mode. Automatic changeover from the irrigation to the environmental mode occurs in accordance with wind, heat or frost. For wind protection, crop cooling and frost protection and when the environmental program is completed the system automatically reverts back to the irrigation mode (except when the first switch is operated, in which case a manual reset operation is required). The irrigation mode has memory in that the irrigation unit resumes watering under the same conditions which existed at the time of transition from the irrigation to the environmental mode. In case of rain, both systems are rendered inoperative and require manual resetting. The irrigation mode incorporates means whereby compensation may be effected in accordance with evaporation conditions. (Sinha-OEIS)

THE BITTERSWEET WATERS OF THE LOWER COLORADO,
R. Findley.
National Geographic, Vol 144, p 540-568, October 1973. 1 map, 9 photo.

Descriptors: *Dams, *Irrigation, *Salinity, *Flood control, *Water demand, Dam sites, Floods, Water supply, Drainage, Flow, Legal aspects, Rivers, *Colorado River, Deltas, Water utilization, Water, Water control, Irrigated land, Water sources, Colorado, California, Mexico.

Since the construction of Hoover Dam, the Colorado River is the most utilized and controlled river in the world, serving fifteen million people and generating a billion dollars worth of wealth. Legal conflicts have involved California, Arizona, Mexico and Indians as each attempts to obtain a larger allotment of the river's water. At the river's mouth is a wall of water, or tidal bore; the dams on the Colorado are causing the demise of this tidal bore. The delta channels are no longer purged of silt by periodic floods. But the water trapped by the dams irrigates thousands of acres of land. Technically, however, the water users along the river have overdrawn its supply, saved only by the slowness of the upper basin states to use their full allotment. Irrigation farmers flush its water through their soil, returning salty drainage back to the river. As one descends the lower Colorado, the water volume shrinks, and the salt content rises. The Colorado salinity question has become the largest issue between Mexico and the United States. Proposals to increase the flow of water in the Colorado include mining water from under California's Imperial Valley, and combing moisture from winter snow clouds over the Rockies. (Ritchie-Florida)

INFILTRATION AND WATER TABLE EFFECTS OF SOIL AIR PRESSURE UNDER BORDER IRRIGATION,
Agricultural Research Service, Reno, Nev. Soil and Water Conservation Research Div.
D. R. Linden, and R. M. Dixon.
Soil Sci Soc Am Proc. Vol 37, No 1, p 94-98, 1973. Illus.
Identifiers: *Infiltration, *Irrigation(Border), *Soil air pressure, *Water table.

Field studies investigated infiltration and water table responses to soil air pressure under border irrigation. The water table was depressed in the center and elevated near the edge of a border strip in response to differences in soil air pressure during an irrigation. Water table elevations also indicated that infiltration and subsequent groundwater recharge rates were greater in the vicinity of a border dike than at the center of the border. An infiltration response was measured by: venting soil air during an actual irrigation and pumping air into the soil during simulated irrigations. An actual border irrigation experiment indicated that displaced soil air pressure ha (expressed as equivalent heads of water) rising to values of 13-24 cm of water reduced infiltration over a 70-min period 14.3-10.3 cm. Simulated border irrigation experiments indicated that displaced soil air pressure ha must exceed surface head hs to have significant influence on infiltration and that the first few minutes of infiltration may determine the ha-to-hs relationship and subsequent infiltration effects. In the simulated irrigations with hs=6.3 cm, total infiltration in 1 hr was 6.0 and 1.5 cm when ha was 0 and 10 cm of water, respectively. Infiltration was only slightly reduced during the first 5 min when ha was 5 cm of water.--Copyright 1973, Biological Abstracts, Inc.

EFFECTS OF MOISTURE STRESS AT EARLY HEADING AND OF NITROGEN FERTILIZER ON THREE SPRING WHEAT CULTIVARS,
Department of Agriculture, Lethbridge (Alberta). Research Station.
S. Dubetz, and J. B. Bole.
Can J Plant Sci. Vol 53, No 1, p 1-5. 1973. Illus.
Identifiers: Cultivars, *Fertilizers, *Moisture stress, *Nitrogen, Spring, Tillering, Triticum-aestivum, *Wheat, Crop production.

Three cultivars of spring wheat (Triticum aestivum L.) were grown at 4 levels of N fertilizer in metal lysimeters protected from rain by an automatic rain shelter. A soil water stress of 8 bars was developed in 1/2 of the lysimeters at the early boot stage. Water stress reduced yield by severely decreasing the number of kernels per spike. Tillering was not affected and kernel weight was increased. 'Pitic 62' withstood the high stress better than 'Manitou' or 'Kenhi.' N enhanced yield by increasing tillering. Kernel weight was unaffected by N, and the number of kernels per spike was decreased. 'Pitic,' which had a higher number of kernels per spike, outyielded 'Manitou' and 'Kenhi.' The protein content of 'Manitou' was higher than that of the other 2 cultivars. The cultivars differed in their reaction to soil water stress and N.--Copyright 1973, Biological Abstracts, Inc.

EFFECTS OF WATER STRESS ON GROWTH AND NITROGEN-FIXING ACTIVITY OF TRIFOLIUM REPENS,
Dundee Univ. (Scotland). Dept. of Biological Sciences.
M. Engin, and J. I. Sprent.
New Phytol. Vol 72, No 1, p 117-126. 1973. Illus.
Identifiers: Age, Growth, *Meristematic activity, *Nitrogen fixation, *Soybean, Trifolium-repens, *Water stress.

The growth and N fixation of T. repens were investigated during the imposition of, and recovery from, different levels of water stress. Growth (measured as fresh and dry weight of roots and shoots, shoot length and N content) and N fixation (per plant and per unit weight of nodule) were depressed by application of water stress. The ability of plants to recover and the time taken for recovery were both related to the duration of the stress period. Meristematic activity in nodules was resumed after watering, making clover nodules more resistant to stress than plants, such as soybean, with spherical nodules. N fixation, estimated by the acetylene reduction technique, was compared with the total N content of plants. Differences between the estimated and actual N content varied with age and degree of water stress.--Copyright 1973, Biological Abstracts, Inc.

THE EFFECT OF WATERLOGGING ON THE MINERAL NUTRIENT CONTENT OF TRIFOLIUM SUBTERRANEUM,
Department of Agriculture, South Perth (Australia).
A. C. Devitt, and C. M. Francis.
Aust J Exp Agric Anim Husb. Vol 12, No 59, p 614-617. 1972.
Identifiers: *Mineral nutrients, Trifolium-subterraneum, Trifolium-subterraneum-ssp-brachycal, Trifolium-subterraneum-ssp-subterran, Trifolium-subterraneum-ssp-yanninicu, *Waterlogging, *Clover.

Waterlogging affected the concentration and total content of nutrients in the leaves of 75 cultivars of the 3 subspecies of subterranean clover (T. subterraneum): yanninicum, subterraneum and brachycalycinum. In the plant tops the concentration of P, Fe, Mn and Cu increased; Zn was unaffected and N, K, Ca, Mg and Na decreased. Total leaf nutrient largely reflected differences in dry matter production. Fe content increased; N, P, K, Mg, Ca, Na and Zn decreased, but P and Mn content was unchanged. The results show a general pattern of subspecies differences in which the chemical composition of subspecies yanninicum was least affected by waterlogging, i.e., a result consistent with the overall better growth of this subspecies in waterlogged conditions.--Copyright 1973, Biological Abstracts, Inc.

A STUDY OF THE INTAKE OF DRINKING WATER BY DAIRY COWS AT GRASS,
Hannah Dairy Research Inst., Ayr (Scotland)
M. E. Castle.
J Br Grassl Soc. Vol 27, No 4, p 207-210. 1972. Illus.
Identifiers: *Cows(Ayrshire), Dairy industry, Milk yield, *Potable water, *Grazing.

The average daily intake of drinking water of 2 groups of 10 spring-calved Ayrshire cows, 1 group on a paddock and the other on a Wye College system of grazing, was measured on 4 days/wk for 20 wk. Trends in water intake were similar on both systems, the average daily intake being 23.0 plus or minus 8.5 kg (5.1 plus or minus 1.9 gal)/cow. The average DM (dry matter) content of the herbage was 17.8% and the mean air temperature 13.4C (56.1F). The weight of water drunk was positively related to the daily milk yield and the DM percentage of the herbage, and negatively related to daily rainfall and relative humidity. All of these relationships were significant. Possible changes in the provision of water for dairy cows at grass are discussed.--Copyright 1973, Biological Abstracts, Inc.

PERFORMANCE OF LUCERNE (MEDICAGO SATIVA) LINES IN PURE STANDS UNDER IRRIGATED AND RAIN GROWN CONDITIONS IN SUB-COASTAL CENTRAL QUEENSLAND,
Department of Primary Industries, Brisbane (Australia).
D. G. Cameron, and J. D. Mullaly.
Aust J Exp Agric Anim Husb. Vol 12, No 59, p 646-652. 1972. Illus.
Identifiers: *Australia(Queensland), Environment, Irrigation, *Lucerne, Medicago-sativa, Nitrogen, Rain, Subcoastal areas, Subtropical conditions, *Crop production.

Seventeen lucerne lines were grown in 2 irrigated and 2 raingrown trials at Biloela, central Queensland(Australia). The cultivar 'Siro Peruvian' outyielded all the other cultivars during the first 2 yr. Seedling vigor, winter growth and regrowth after cutting were better in 'Siro Peruvian' than in 'Hunter River,' but it had shorter stand life and lower N content. 'African' gave similar annual yields to 'Hunter River' even though in seedling vigor, winter growth and rate of regrowth after cutting it was similar to 'Siro Peruvian.' The other lucerne lines were not adapted to the hot subtropical environment, and especially in the irrigated trials their yields or survival or both were much poorer than those of 'Hunter River.'--Copyright 1973, Biological Abstracts, Inc.

AN IRRIGATION SCHEDULING MODEL WHICH INCORPORATES RAINFALL PREDICTIONS,
Auburn Univ., Ala. Dept. of Agricultural Engineering.
E. W. Rochester, and C. D. Busch.
Water Resources Bulletin, Vol 8, No 3, p 608-613, June, 1972. 5 fig, 5 ref. OWRR A-025-ALA(2).

Descriptors: Irrigation, *Scheduling, *Irrigation practices, Supplemental irrigation, Soil moisture, Evapotranspiration, Consumptive use, Agricultural engineering, Mathematical modeling, Computer models, *Forecasting, *Rainfall.
Identifiers: *Irrigation scheduling.

In humid areas appreciable amounts of rainfall complicate irrigation scheduling. This rainfall tends to give supplemental water application a low priority. Irrigation may be delayed until there is not enough time to cover the crop area before some drought damage occurs. To improve the management of irrigation systems, a scheduling model has been developed. The model's water application decisions incorporate climatological records, soil-plant data, current pan evaporation and rainfall, the number of fields to be irrigated, and 5-day weather forecasts. The model updates the soil moisture conditions, predicts impending water depletion, and if supplemental water is needed both the field priority and amounts to be applied is indicated for each of the next 5 days. Errors introduced through the use of forecasts and long-term pan evaporation records have been slight because of the tri-weekly updating. Also natural rains which restore the root zone to maximum water holding capacity prevent long-term bias. (Skogerboe-Colorado State)

EFFECTS OF SUBSURFACE ASPHALT LAYERS ON CORN AND TOMATO ROOT SYSTEMS,
Florida Univ., Gainesville. Dept. of Soil Science.

G. K. Saxena, L. C. Hammond, and W. K. Robertson.
Agronomy Journal, Vol 65, No 2, p 191-194, March-April, 1973. 3 fig, 2 tab, 13 ref.

Descriptors: *Root systems, *Root zone, *Asphalt, Barriers, Root distribution, *Corn field, *Tomatoes, Crop response.

This study was initiated to determine the nature and reason of any influence of a subsurface asphalt layer on root growth and distribution in the soil profile. Observations of root distributions of sweet corn and tomato were made in freshly dug pits. Root sections in and out of the asphalt layer were photographed and examined microscopically for morphological effects. The 'line-intercept' method was used to obtain quantitative measurements of root concentration of field corn. Tomato roots in the asphalt layer were larger in diameter and showed damage to cells in the cortex. Rooting of all crops was less extensive in soil below the asphalt layer than in soil at the same depth without the asphalt. Concentration of corn roots in the top 60 cm of soil averaged 1.6, 1.7, 2.0, and 2.2 cm/cc for the following respective treatments: control, control with irrigation, asphalt layer, and asphalt layer with irrigation. LIVEWEIGHT GAINS OF SHORTHORN STEERS ON NATIVE AND IMPROVED PASTURES AT ADELAIDE RIVER NORTHERN TERRITORY,
Northern Territory Administration, Darwin (Australia). Animal Industry and Agriculture Branch.
R. N. Wesley-Smith.
Aust J Exp Agric Anim Husb, Vol 12, No 59, p 566-572, 1972. Illus.
Identifiers: *Australia(Adelaide River), *Pastures, Rivers, *Cattle(Shorthorn steers), Liveweight gain(Cattle).

Data from over 40 grazing trials conducted with Shorthorn steers during 1961-1968 in a tropical monsoonal climate, mean rainfall about 127 cm, at Adelaide River, Northern Territory, Australia, are presented. The average yearly liveweight gain on native pasture at 1 beast to 4-8 ha was 18 kg, due to gains in Nov.-Dec. but weight maintenance or loss occurred during most of the year. The average yearly liveweight gain on Townsville stylo based pastures at 1 beast to 0.4-1.2 ha was 95 kg, with gains of about 0.5 kg/day in the wet season and weight maintenance in the dry. These results are lower than those reported for Katherine, Northern Territory. Other pastures, including phasey bean, were also useful. Some evidence is presented of compensatory gain, and of a comparison of Brahman crossbred steers with the Shorthorns. Possible reasons for the better performance by steers at Katherine compared to Adelaide River are discussed.--Copyright 1973, Biological Abstracts, Inc.
W74-07453

AMMONIUM AND NITRATE UPTAKE BY CORN (ZEA MAYS L.) AS INFLUENCED BY NITROGEN CONCENTRATION AND NH4(+)/NO3(-) RATIO,
Michigan State Univ., Lansing.
D. D. Warncke, and S. A. Barber.
Agronomy Journal, Vol 65, p 950-953, 1973. 1 fig, 5 tab, 16 ref. OWRR B-026-IND(2).

Descriptors: *Farm management, *Absorption, *Nitrates, *Ammonium, *Corn(Field), Soil-water-plant relationships, Nitrogen compounds, *Nitrification, Nutrients.
Identifiers: Shoot/Root ratio, Plant weight, Uptake coefficient, Ammonium/Nitrate ratios.

Corn absorbs both ammonium and nitrate forms of N. The relative proportion of the two can be controlled by affecting nitrification. Little is known about the relative rates of absorption of these ions or their effect on plant growth when both are present. Investigations were made in nutrient solutions with 5 N concentrations at each of 5 ammonium/nitrate ratios. Maximum dry matter accumulated with an N concentration of 67 millimoles. Maximum N uptake occurred for the combination of 303 millimoles N and ammonium/nitrate ratio of 2.46. Shoot/root ratio increased significantly with increased N concentration but was unaffected by the ammonium/nitrate ratio. There was no significant difference between ammonium and nitrate in their relative rates of absorption. Increasing the concentration of ammonium reduced the nitrate rate and increasing the nitrate concentration reduced the ammonium uptake rate.
W74-07459

EFFECT OF IRRIGATION WITH THERMAL WATER ON TRACE-ELEMENT CONTENT IN SOME SOILS OF GEORGIA (VLIYANIYE OROSHENIYA TERMAL'NYMI VODAMI NA SODERZHANIYE MIKROELEMENTOV V NEKOTORYKH POCHVAKH GRUZII),
F. N. Gelashvili.
Pochvovedeniye, No 4, p 80-86, April 1973. 2 tab, 17 ref.

Descriptors: *Land reclamation, *Irrigation practices, *Thermal water, *Trace elements, *Soil types, Nutrients, Corn(Field).
Identifiers: *USSR(Georgian SSR).

The amount of thermal water used for irrigation in eastern Georgia during the growing season was 2,700 cu m/ha in 1967, 3,200 cu m/ha in 1968, 2,800 cu m/ha in 1969, and 3,100 cu m/ha in 1970. In western Georgia, because of wetter climate, irrigation rates were less--1,980 cu m/ha in 1967, 2,750 cu m/ha in 1968, 2,000 cu m/ha in 1969, and 2,580 cu m/ha in 1970. Thermal-water irrigation of Meadow-Alluvial and Red Earth-Podzolic soils of Georgia increases the content of available forms of macro- and microelements, which generally promotes nutrient accumulation in the upper part of the profile. Trace-element availability in soils irrigated with thermal water depends not only on pH and natural oxidation-reduction conditions but also on degree of soil wetting by geothermal waters at a temperature of 25-28 deg C. Trace-element availability depends also on the addition to soil of dissolved trace elements, which tend to intensify biochemical reactions, create readily assimilable forms of nutrients and to improve conditions for plant vital activity. Accumulation and quantitative redistribution of nutrients in soil planted to corn depend on chemical composition of thermal waters, soil physicochemical properties, and on variety, spacing, and stage of development of plants. Phosphorus, potassium, and nitrogen accumulate in soils irrigated with thermal water. Ca and CO3 entering the soil tend to neutralize the acidic reaction of Red Earth-Podzolic soils, creating the conditions necessary for growth, development, and increased yield of corn. Thermal-water irrigation increases corn grain yield from 32% to 80% as compared with the control, depending on soil and climatic conditions, variety of the corn, and chemical composition of the thermal water. The yield doubles on an irrigated plot as compared with the control, and the growing season is shortened, on the average, by 20-25 days. (Josefson-USGS)

WATER RELATIONS OF WHEAT AS AFFECTED BY IRRIGATION AND NITROGEN FERTILIZATION,
Lincoln Coll. (New Zealand). Dept. of Plant Science.
C. T. Dougherty.
N Z J Agric Res. Vol 16, No 1, p 12-18, 1973.
Identifiers: Fertilization, *Irrigation, Leaf, *Nitrogen fertilization, Transpiration, *Wheat.

Water potentials of flag leaves and ears on the same tiller of Kopara wheat were measured soon after ear emergence by a pressure-bomb technique. Water potentials of ears were nearly 0.5 bar higher than those of flag leaves. At soil water levels (0-15 cm) of 20%, water potentials of -8 to -9 bars were recorded at 9:00 a.m. on a day of high solar radiation with relatively little advective heat point, and the water potentials of the ears were lower than -20 bars. N fertilizer had no direct effect on ear water potential, but in non-irrigated wheat it depleted soil water, probably by increasing leaf area index and transpiration. As a result soil water levels in non-fertilized, non-irrigated plots were well above the wilting point, and the water potentials of the ear of wheat growing in them were similar to those which were irrigated.--Copyright 1973, Biological Abstracts, Inc.

BACKGROUND SURVEY. SURFACE DRAINAGE PROGRAM, MADISON, SAINT CLAIR, MONROE AND RANDOLPH COUNTIES, ILLINOIS.
Southwestern Illinois Metropolitan Area Planning Commission, Collinsville.
Available from the National Technical Information Service as PB-222 504, $7.25 in paper copy, $1.45 in microfiche. Final report prepared for Department of Housing and Urban Development, April 1973. 90 p, 21 fig, 9 tab, 117 ref. WRC-III. Title III.

Descriptors: *Illinois, *Flood protection, *Flood damage, *Drainage systems, *Drainage water, Management, Hydrologic data, Drainage patterns, Drainage effects, Surface runoff, River basin development, Flood plain zoning, Storm runoff, Storm water.
Identifiers: *Regional planning, Randolph County(Ill), Monroe County(Ill), St. Clair County(Ill), Madison County(Ill).

The purpose of a drainage program for Southwestern Illinois (Madison, Monroe, St. Clair, and Randolph Counties) is to identify and analyze drainage and flooding problems and formulate solutions for future implementation. Information concerning the physical and hydrological character of the region, storm drainage water, and flood control for major hydrological units, and agencies responsible is first collected. Results of the initial information survey are presented. Drainage and flood damage control has been accomplished by structural measures, whereas non-structural measures, such as flood plain zoning, have not been used. Three river systems, the Mississippi, Kaskaskia, and Mary's, make up the surface water resource and natural drainage system, but information is scarce for smaller bodies of water. The magnitude of drainage problems and frequency of urban flooding points to a need for land use management principles. Drainage systems must be designed to accommodate future as well as existing needs, requiring increased knowledge about area-wide development. An immediate need for a comprehensive surface drainage planning program to insure coordination among federal, state, and local projects is evident; its implementation will comprise the remainder of the program. (Grden-North Carolina)

THE RELATIONSHIP OF LAND USE TO WATER USE IN SAN ANTONIO, TEXAS,
Texas Univ., Austin. Center for Research in Water Resources.
D. R. Young, and J. F. Malina, Jr.
Technical Report EHE-72-2, CRWR-84. May 1972. 38 p, 9 fig, 24 ref, 1 append. EPA 5T2-WP-183-03,04.

Descriptors: Water management(Applied), *Land use, *Water utilization, *Water consumption, *Water demand, *Texas, Municipal water, Industrial water, Water distribution, Water delivery, Water supply, Water control, *City planning, Planning.
Identifiers: *San Antonio(Tex), Land use planning, Housing density, Housing valuation, Employee concentrations.

A methodology for estimating the relationship between water use and land use in a metropolitan area is developed, based on data from San Antonio, Texas. Water use for 1963 through 1970 was evaluated in regard to housing density, median housing valuation, and employee concentration. When average water use data were correlated with those land use parameters, results showed water consumption in an urban area is a function of land use. Population is the most important factor affecting water use, with household density serving as an adequate predictor. Employee density showed the effect of commercial and industrial activity upon water use, since water sales by the City Water Board were not categorized by household, commercial, and industrial use. Water use is also a function of the consumers' economic level, and housing value exemplifies this. Water use and total annual rainfall are related, but more information is needed concerning the effects of rainfall upon amount of lawn sprinkling. Planners must predict future housing densities, commercial and industrial centers, and economic level changes to plan water supply resources and distribution systems. Zoning is recommended to enforce and establish land use patterns which insure adequate resources and systems. (Grden-North Carolina)

A FRAMEWORK FOR ECONOMIC PLANNING OF WATERSHED DRAINAGE,
Manitoba Univ., Winnepeg. Agassiz Centre for Water Studies.
G. A. Norton, and J. A. MacMillan.
Research Report No. 6, 1972. 63 p, 2 fig, 8 tab, 45 ref.

Descriptors: *Canada, *Watershed management, Drainage, *Drainage areas, *Drainage basin, *Project planning, *Project benefits, Drainage district, Watersheds, Drainage effects, Drainage programs, Drainage engineering, Administration, Feasibility, Project purposes, Water conservation, Water resources development.
Identifiers: Interlake Area(Manitoba), Public investment, Public project expenditures, Manitoba(Canada).

A theoretical framework for drainage planning synthesizing biological, engineering, economic and institutional concepts; the relationships among drainage inputs, resource modification, and economic welfare; and evaluation of impacts of drainage expenditures for the Interlake Area of Manitoba, Canada, are objectives for this study on a farm level economic evaluation of drainage. Efficiency criterion show changes in private income that occur per unit of public project expenditure and distribution criterion identify effects on income groups and their geographic location. Results show farmers believe drainage is beneficial due to the Provincial Government's drainage subsidy program, and some communities are quite dependent on their infrastructure drainage components. Such information aids in watershed management and in the allocation of public funds among resource expenditure categories. When deciding whether to drain a watershed, information concerning future demand for food, desirability of drainage (opportunity cost of providing food in other ways), the land's suitability for drainage, and profitability of drainage is needed. The formulation of a decision process based upon a comprehensive evaluation method is often constrained by existing institutional structures. Institutions with a favorable impact on welfare and the ability to view the watershed as part of an ecosystem constitute a favorable structure. (Grden-North Carolina)

FLOOD PLAIN INFORMATION-NEUSE AND TRENT RIVERS AND JACK SMITH CREEK, NEW BERN, NORTH CAROLINA.
Army Engineer District, Wilmington, N.C.
May, 1969. 50 p, 10 fig, 11 plates, 2 tab.

Descriptors: Floods, *Flood damage, Tidal effects, *Saline water barriers, *Hurricanes, *Flood control, Flood peak, Flood flow, *North Carolina.
Identifiers: *Tidal floods, Hurricane 'Ione', Standard Project Tide Flood, Intermediate Regional Tide Flood, *New Bern(N.C.), Neuse River(N.C.), Trent River(N.C.), Neuse River Estuary(N.C.).

While New Bern, North Carolina, is subject to both fresh-water flooding and salt-water tide flooding, abnormal rises in tides in the Neuse River estuary are the primary causes of flood damage. Approximately 57% of New Bern is vulnerable to flooding, due to low elevations ranging from 10 to 15 feet above mean sea level. The greatest tide flood was caused by Hurricane 'Ione' in 1955. Flood waters rose to 10.6 feet above mean sea level, accompanied by wind gusts up to 80 miles per hour and a rainfall of 12.23 inches in 24 hours. Analysis indicates that an Intermediate Regional Flood of the tide type would be about 1.4 feet higher than the Hurricane 'Ione' tide flood. A Standard Project Tide Flood would be about 2.4 feet higher than the Intermediate Regional Tide Flood. A flood-tide-barrier project across the Neuse River estuary and located 18 miles below New Bern was authorized for construction by

ongress in 1965 to provide against hurricane-tide ooding in New Bern and vicinity. By 1969 how-ver, no funds were appropriated for the project. he barrier would be a 10,400-foot-long, dredge ill structure, with side slopes of 1 vertical to 30 orizontal, a crest elevation of 16 feet above mean ea level, and a crest width of 50 feet. When con-tructed, it would reduce the elevation of a tide lood equal to the 1955 record tide flood from 10.6 eet mean sea level to about 5.4 feet mean sea evel. Reduction of the Intermediate Regional Tide lood would be 6.2 feet, from 12.0 feet mean sea evel to about 5.8 feet mean sea level. (Hoffman-lorth Carolina)
V74-07073

LOOD PLAIN INFORMATION-NEUSE RIVER ND BUFFALO CREEK, SMITHFIELD, ORTH CAROLINA.
rmy Engineer District, Wilmington, N.C.
ugust, 1971, 58 p, 9 fig, 13 plates, 15 tab.

Descriptors: Floods, *Flood damage, *Dams, River regulation, *Flood control, Flood peak, lood profile, Flood flow, *North Carolina.
dentifiers: Falls Lake(N.C.), Standard Project lood, Intermediate Regional Flood, Neuse iver(N.C.), Buffalo Creek(N.C.), Smithfield(N.C.).

Smithfield, North Carolina lies in the middle of the Neuse River drainage basin. Neuse River and Buf-alo Creek converge on the northern edge of town; ogether they form the western and northern town imits. Approximately 56%, or 1,265 acres, of the own is subject to flooding from major floods on hese streams. This area includes the town's water reatment and sewage treatment plants. Analysis ndicates that Intermediate Regional Floods would ttain depths of about 19 feet above bankfull on he Neuse River and about 10 feet above bankfull n Buffalo Creek. This would result in the flooding f 485 acres and 40 structures within the town imits. Standard Project Floods would generally be 8 to 19 feet higher than Intermediate Regional Floods, resulting in flooding of the entire flood lain and the 830 structures located on it. Maps, rofiles and cross sections detail the extent of past loodings and possible future flooding. With this nformation, minimum floor levels for buildings or control of flood damage can be determined. Falls Lake, to be located 47 miles upstream from Smithfield on the Neuse River, will control 63% of he drainage area above Smithfield. The project will have a maximum regulating effect on flood tages at Smithfield of about 3.5 feet. (Hoffman-North Carolina)
W74-07074

FLOOD PLAIN INFORMATION: BURDENS AND TWO BOTTLE CREEKS AT RESEARCH TRIANGLE AREA, DURHAM COUNTY, NORTH CAROLINA.
Army Engineer District, Wilmington, N.C.
June, 1972. 21 p, 7 fig.

Descriptors: *Floods, *Flood damage, *Flood profiles, Flood peak, Flood flow, *North Carolina.
Identifiers: Intermediate Regional Flood, Standard Project Flood, Burdens Creek(N.C.), Two Bottle Creek(N.C.), Research Triangle Area(N.C.).

Burdens Creek is a main tributary of Northeast Creek. It rises in the south central part of Durham County and flows in a southwesterly direction through the Research Triangle Park, North Carolina. This report covers Burdens Creek from its confluence with Northeast Creek to N.C. Highway 54, a distance of 2.12 miles. Also included is Two Bottle Creek, a tributary of Burdens Creek. Two Bottle Creek enters Burdens Creek 1.34 miles from Northeast Creek. The study covers the .53 mile section south of N.C. Highway 54. No flood discharge or stage records are available for either creek. Determination of flooding potential in the Burdens Creek and Two Bottle Creek area is therefore based on data on streams with similar geographical and physiographical characteristics. Maps, profiles and cross sections delineate the extent of possible flooding. At the present time land-use along the creeks is 20% agricultural and 80% woodland. The only facilities that would be affected by flooding are highway bridge crossings. The Intermediate Regional Flood would flood one highway crossing and the Standard Project Flood would overflow five. (Hoffman-North Carolina)
W74-07075

FLOOD PLAIN INFORMATION - GLADE CREEK, VINTON, VIRGINIA.
Army Engineer District, Wilmington, N.C.
December, 1971. 35 p, 5 fig, 11 plates, 7 tab.

Descriptors: Floods, *Flood profiles, *Flood damage, Flood peak, Flood flow, *Virginia.
Identifiers: *Intermediate Regional Flood, *Standard Project Flood, Glade Creek(Va.), *Vinton(Va.).

Records pertaining to floods and flood damage along Glade Creek in Vinton, Virginia are extremely scarce. Based on an analysis of intense rainfall data, it was estimated that floods have occurred at a rate of nearly 1 every 3 years. Contour maps, profiles and cross sections indicate the extent of past flooding and potential future flooding. A Standard Project Flood would cause flood stages from about 12 to 20 feet higher than bankfull stages, depending on location. This would flood approximately 420 structures within a 585 acre area. An Intermediate Regional Flood would cause flood stages from about 4 to 11 feet higher than bankfull stages, also depending upon location. This would flood approximately 100 structures within a 388 acre area. (Hoffman-North Carolina)

STUDY DESIGN. SURFACE DRAINAGE PROGRAM, MADISON, ST. CLAIR, MONROE AND RANDOLPH COUNTIES, ILLINOIS.
Southwestern Illinois Metropolitan Area Planning Commission, Collinsville.
Available from the National Technical Information Service as PB-222 487; $6.25 in paper copy, $1.45 in microfiche. Final report. No SWIL-MAPC 73-11. June, 1973. 74 p, 4 fig. HUD-Ill-P 317-2-275.

Descriptors: *Flood control, Surface drainage, *Surface runoff, *Watershed management, *Comprehensive planning, River basin development, Drainage, Runoff, Urban runoff, *Illinois, Water control, Abatement, Flood damage, Storms, Watersheds, Drainage area, Drainage effects, Water quality, Environmental control, Environmental effects, Regional development.
Identifiers: *Surface drainage program, *Illinois, Madison County(Ill), St. Clair Co.(Ill), Monroe Co.(Ill), Randolph Co.(Ill).

This comprehensive drainage and flood abatement planning program provides techniques and guidelines needed to formulate and implement solutions for drainage problems found in the 2,375 square miles within the political boundaries of Madison, St. Clair, Monroe and Randolph Counties, Illinois, which (except for Randolph) comprise part of the St. Louis Metropolitan Area. Political boundaries are disregarded in order to consider total watershed surface drainage planning. The Planning Area lies within the basins of the Mississippi, the Kaskaskia and Mary's Rivers divided into ten sub-basins. Urbanized centers range in size from small outlying communities with less than 500 to conglomerate urbanized areas with populations exceeding 150,000 in the northwestern quadrant. A detailed description of methodology, a description of work activities and information required, and a detailed model of the plan development process are provided. Various planning and engineering tasks to be carried on during the program are outlined in terms of objectives, scope and content description, input, output, staff skills needed, and time element. Cost estimates, flow charts of work activities and scheduling, and other information are provided. An effort will be made to coordinate this program with related water resources activities and programs of other agencies. (Grden-North Carolina)

STATE FLOOD CONTROL PROGRAM.
Arizona Water Commission, Phoenix.
Report No 3, March 1973, 40 p. 5 fig, 6 tab.

Descriptors: *Building codes, *Zoning, *Project planning, *Flood control, Cost analysis, Floods, Flood plain zoning, Alluvial fans, Arizona, Flood damage, Civil engineering, Check structures, Flood plains, Water management(Applied), Water policy, Hydraulic structures, Dams.

Since much of the land which Arizonans use to live and work is subject to frequent flooding, a comprehensive flood control program is required. Floodplains and alluvial fans are the two principal landforms subject to inundation which support the vast majority of the population. A two-fold program is required to meet the flood control needs of Arizona. The first phase, involving the physical protection of development which has already been established in floodprone areas, identified these areas and proposes flood control measures which will cost in the excess of $400 million. The second phase of the Arizona flood control program must protect areas not yet developed, by proper zoning, building regulations, and planning. The first of these considerations is emphasized. A total of 47 projects are identified and a short description and recommendation for each is given. Legislative recommendations and acts associated with the flood control program proposition are presented in an appendix. The economics, method of payment and costs of the projects are included. HAWAII'S STATEWIDE LAND CLASSIFICATION PROVES ADAPTABILITY AS LAND USE AND ENVIRONMENTAL CONCERNS CHANGE,
Hawaii State Land Study Bureau, Honolulu.
H. L. Baker.
In: Hawaii Univ., Honolulu, Water Resources Research Center, Water Resources Seminar Series No. 2, December 1972, p 77-81,

Descriptors: *Hawaii, *Land classification, *Land use, *Water quality, Zoning, Decision making, Urbanization, Agriculture, Productivity, Land development, Economics, Planning.
Identifiers: *Land types, *Land categories, Oahu(Hawaii), Maui(Hawaii).

To meet the challenge of growing demands on its limited land resources Hawaii has created a statewide land classification system which inventories the suitability of existing resources for agricultural suitability and productivity. The system groups land into homogeneous units known as land types,

describes their physical conditions and environment, delineates the land type units utilizing areal photos and rates land according to its productivity under alternative uses. While the study appears to have been initially developed to handle problems in agricultural development, such elements as slope, stoniness, depth of soil and drainage are also useful in making urban development decisions. As a result, a classification system of urban land has arisen from data collected under the statewide survey. The existing system has already proved to be a useful tool in the development of statewide zoning, local community development, and in recent re-evaluation of specific urban-use suitability of lands within the urban zone as defined under the State Land Use Law. PROBLEMS IN DISTRIBUTION OF WATER RESOURCES IN THE ARID ZONE OF THE AMUDAR'YA RIVER BASIN (VOPROSY RASPREDELENIYA VODNYKH RESURSOV V ARISNOY ZONE (NA PRIMERE AMUDAR'I)),
Akademiya Nauk SSSR, Moscow. Institut Vodnykh Problem.
A. A. Bostandzhoglo.
Vodnyye Resursy, No 5, p 55-67, 1973. 1 fig, 10 tab, 7 ref.

Descriptors: *Water resources, *Water distribution(Applied), *Arid lands, *Irrigation, Irrigation systems, Irrigated land, Water utilization, Agriculture, Cotton, Mathematical studies, Optimization, Economics.
Identifiers: USSR, *Soviet Central Asia(Amudar'ya River basin).

The major water user in Soviet Central Asia today and in the years ahead is irrigated agriculture, which will soon cover 7 million ha in the Kirgiz, Tadzhik, Uzbek, and Turkmen Republics. Land suitable for irrigation in Soviet Central Asia is about 26 million ha, including 13.5 million ha in the Syrdar'ya basin and 12.5 million ha in the Amudar'ya basin. Land cropped to cotton is about 2.8 million ha, representing more than 95% of all cotton produced in the USSR. Water resources in basins of Soviet Central Asian rivers in an average water year are about 120 cu km, including 80 cu km in the Amudar'ya system and 40 cu km in the Syrdar'ya system. River runoff in the Syrdar'ya basin can be used to irrigate 3 to 3.5 million ha, and river runoff in the Amudar'ya basin, 5 to 5.2 million ha. Based on investigations in the Amudar'ya basin and use of mathematical programming techniques, a working method was proposed and a solution obtained for an optimization problem on water-resource distribution among different water users. Results of optimization computations were compared with data obtained earlier in a general program for complex use of water resources of the Amudar'ya River. Procedures recommended for distribution of limited water resources can be used to solve similar problems for any region where irrigation merits prior attention. (Josefson-USGS)

Akademiya Nauk SSSR, Moscow. Institut Vodnykh Problem.
V. Ye. Prival'skiy.
Vodnyye Resursy, No 5, p 17-28, 1973. 2 fig, 23 ref.

Descriptors: *Lakes, *Water level fluctuations, *Statistical methods, Statistical models, Stochastic processes, Forecasting, Inflow, Evaporation, Circulation, Equations
Identifiers: *USSR(Caspian Sea).

A method is presented for optimal linear extrapolation of regular random processes based on their parametric models. A method is described for constructing these models, based on estimates of correlation and partial correlation functions of the process. The problem of forecasting level fluctuations of a closed water body from a water-balance equation is examined within the framework of the theory of random processes, and a long-range forecast is made of level fluctuations of the Caspian Sea to the year 2000, provided the present level of irretrievable water losses in the sea basin is maintained. An approximate stochastic model was constructed of fluctuations of visible evaporation from the sea surface for 1890-1969. Changes in stochastic models of inflow and visible evaporation were found to have little effect on the results of the long-range forecast. The need to construct a physical model that relates level fluctuations of the Caspian to large-scale air and ocean circulation processes and their effects is noted. (Josefson-USGS)

AGANA SMALL BOAT HARBOR, AGANA, GUAM (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Corps of Engineers, Honolulu, Hawaii. Pacific Ocean Div.
Available from the National Technical Information Service as EIS-PI-73-0847-F; $4.75 in paper copy, $1.45 in microfiche. February 23, 1973. 39 p, 4 fig.

Descriptors: *Environmental effects, *Harbors, *Aquatic habitats, Construction, Aquatic life, Reefs, Wastes, Oil spills, Water supply, Fish, Wildlife, Navigation, Coastal structures, Shore protection.
Identifiers: *Environmental Impact Statements, *Guam(Agana).

The project under consideration is the construction of a small boat harbor in Agana, Guam. Implementation of the proposed plans will alter the existing shallow reef. The proposed harbor would improve boating conditions and enhance recreational uses. The impact upon marine life will be limited to construction periods. No rare or endangered species nor any areas of historical significance will be affected. Some of the adverse environmental effects are various short-term impacts during construction, use of 40 acres of reef flat habitat, and possible conflicts of use among boaters, surfers, and fishermen. Three alternatives; alternative sites, alternate harbor configuration, or no action at all. The responsibilities for control of harbor pollution from fuel and oil spills and ship wastes rest with the local interests. The following protected uses will come from the harbor: industrial water supply, propagation of fish and other aquatic life, esthetic enjoyment, recreation, and navigation. (Daniels-Florida)

dentifiers: *Environmental impact statement, Lewes(Del).

he feasibility was evaluated of restoring and stailizing a portion of the shoreline of Lewes, elaware, by providing beach erosion control easures resulting in a protective and recreational each adequate to meet the area's present and fuure needs. The proposed plan consists of beach ill, periodic nourishment, sand fence and dune rass. The beach fill will be dredged from oosevelt Inlet. Implementation of the plan would revent storm damage, improve the beach's apearance, and satisfy recreational beach use deand. Disturbance of bottom sediments would ause a temporary increase in turbidity and bacerial counts in overlying waters which would not esult in any significant effect on fishery esources, as the seasonal dredging would not inerfere with shellfish or finish reproduction. Conurrence and approval of the plan by numerous ederal and state agencies affirms the plan as an nvironmentally sufficient method of repairing the resent beach erosion problem. (Silber-Florida)

CAPITAL COST MINIMIZATION OF DRAINAGE NETWORKS,
Duke Univ., Durham, N.C. Dept. of Civil Engineering.
J. S. Dajani, and Y. Hasit.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol. 100, No. EE2, Proceedings paper No. 10448, p 325-337, April 1974. 3 fig, 2 tab, 18 ref.

Descriptors: *Drainage systems, *Networks, *Sewers, Costs, *Environmental engineering, Computers, Linear programming, Optimization, Model studies, Hydraulics, Sanitary engineering, Economics, Pipes, Flow design, Size, Systems analysis.
Identifiers: Separable-convex programming, Mixed-integer programming, *Cost minimization.

Three mathematical programming models for the optimization of drainage networks are presented and compared. The models suggest a feasible design methodology for selecting pipe size and slope combinations for a given network layout; the methodology produces the minimum cost design under given assumptions. The three models are based on two extensions of linear programming: separable-convex and mixed-integer programming. The former produces a continuous range of diameters while the latter limits the solution to discrete commercially available sizes. It is shown that while the former can be formulated with pipes flowing full, the latter must allow for partial flow. A solution which combines both these techniques is shown to produce a minimum cost system with partially-full flows and commercially available diameters. This solution requires less computer time than those based strictly on mixed-integer programming. An example seven-link drainage network has been designed by the three alternative model formulations and the results are presented. Mixed-integer programming coupled with convex-separable programming presents itself as a feasible design and optimization tool for drainage networks. (Bell-Cornell)

NETWORK APPROACH TO MANAGEMENT OF CONJUNCTIVELY OPERATED GROUND WATER - SURFACE WATER SYSTEMS,
Illinois Univ., Urbana. Dept. of Civil Engineering.
A. S. Hamdan.
Available from the National Technical Information Service as PB-231 769 $13.00 in paper copy, $1.45 in microfiche. Ph.D Thesis, 1974 187p, 26 tab, 36 fig, 125 ref, 2 append. OWRR A-059-ILL(1) 14-31-0001-3813.

Descriptors: *Algorithms, *Illinois, Networks, *Conjunctive use, Water management(applied), Model studies, Costs, Water allocation, Planning, Forecasting, *Optimum development plans.
Identifiers: Management planning, *Network analysis, Optimum design, *Kaskaskia River Basin(Ill).

The approach involves modeling a problem as a network and solving it by network-based solution algorithms. The network model of a water resources system consists of nodes and directed arcs. The nodes represent supplies where water is originated, uses where water is consumed, and intermediate nodes where water is conserved. Linear unit 'costs' (representing actual costs or some function of returns) are imposed on appropriate network arcs. Any other constraints on the amount of water to be allocated from a particular supply to a particular use are also imposed as bounds on appropriate network arcs. A network model and the out-of-kilter Algorithm were used to determine optimal plans to meet the water supply requirements in the Kaskaskia River Basin in South-Central Illinois, over a planning period of 50 years starting in 1970, using local surface and ground water sources and a source of water import.

PLANAR AND AXISYMMETRIC BOTTOM WITHDRAWAL FROM A DENSITY-STRATIFIED RESERVOIR,
Wisconsin Univ., Madison. Dept. of Civil and Environmental Engineering.
J. C. Ho.
Available from the National Technical Information Service as PB-231 768 $15.50 in paper copy, $1.45 in microfiche. Ph.D. Thesis, 1973. 230 p, 48 fig, 3 tab, 42 ref, 8 append. OWRR B-080-WIS (1) 14-31-0001-3948.

Descriptors: Model studies, Engineering, Equations, *Resevoir releases, *Density currents, *Stratification, *Withdrawal, Flow, *Mathematical models, *Stratified flow.
Identifiers: Viscous flow, Transition flow, Sinks.

This study deals with theoretical and experimental investigations on selective withdrawal of a viscous, non-diffusive linearly stratified fluid from the bottom of a reservoir. Two-dimensional planar and axisymmetric flows are considered in the mathematical treatment. A model is developed to describe planar, bottom withdrawal. A solution to the governing differential equations is attempted using a momentum integral technique. Accordingly, the horizontal momentum equation is integrated across the withdrawal layer. Fourteen laboratory experiments were conducted on a tank 15 cm. wide, 60 cm. high and 600 cm. long to verify the mathematical model. A density-stratified fluid is produced by slowly releasing into the experimental reservoir, successive thin layers of salt solution of decreasing density. Horizontal velocity profiles are measured by photographing the displacement of an initially vertical dye streak. Experimental results confirm the predicted growth of the withdrawal layer and other theoretical findings, such as the maximum horizontal velocity in the withdrawl layer. An axisymmetric bottom withdrawal model is developed. The mathematical treatment is similar to that of the planar model. Twenty laboratory experiments were conducted on a tank in the shape of a quadrant 153 cm. in radius and 57 cm. high. Experimental data confirm the predicted growth of the withdrawal layer and other theoretical findings.

MANAGEMENT OF SOUTH WESTLAND TERRACE PODOCARP FOREST UNDER A SELECTION LOGGING SYSTEM,
New Zealand Forest Service, Harihari.
R. K. Gover.
N.Z.J. For. Vol 17, No 2, p 256-265, 1972. Illus.
Identifiers: Dacrydium-Cupressinum, Degradation, Forests, Logging, *Management, Mineral, *New Zealand(Westland), Nutrients, *Podocarp forests, Scarification, Soils, Terrace, Waterlogged.

Selection management began on the morainic podocarp forests of State tenure in south Westland(New Zealand) in 1963 in an effort to conserve forest structure and to provide a timber source in perpetuity. The area of these forests is 14,500 ha. During the first 7 yr of the initial cutting cycle (prescribed as 30 yr) some 710 ha were worked. Past clearfelling practices on these terraces caused severe soil degradation. The soils are naturally characterized by water logged mineral horizons, hardpan formations, lack of structure, severe leaching, acidity and extreme nutrient deficiency. Under the selection system, however, this degradation is kept to a minimum by retention of forest structure. Machines used, and extraction methods employed, are governed by stand condi-

tions. Mechanical damage to residual trees is kept to a minimum, rarely exceeding 5%, and machine scarification of the ground improves seedbed conditions. The effect heavy machinery is having on increment, through compaction of shallow feeding roots of rimu (Dacrydium cupressinum), is not certain at this stage. Ponding in localized areas also causes root damage to rimu, and subsequent mortality is rapid. Selection logging may eventually be extended to replace clearfelling practice in hill country forests. --Copyright 1973, Biological Abstracts, Inc.

INSTRUMENTATION FOR ENGINEERING MANAGEMENT OF A MULTI-PURPOSE RIVER BASIN SYSTEM (TRINITY RIVER BASIN, TEXAS) REAL-TIME ENGINEERING MANAGEMENT OF A MULTI-PURPOSE RIVER BASIN SYSTEM,
Texas Univ., Austin. Center for Research in Water Resources.
Q. W. Martin, E. F. Gloyna, and W. G. Lesso.
Availability from the National Technical Information Service as PB-231 867, $6.00 in paper copy, $1.45 in microfiche. Completion Report CRWR-98, December 1973. 216 p, 31 fig, 22 tab, 75 ref. OWRR B-079-TEX (2). 14-01-0001-3337.

Descriptors: *Instrumentation, Data acquisition, On-site data collection, *Texas, Automatic control, Economic feasibility, Sampling, *Reservoir operation, River basins, Waste discharges, *River systems, Linear programming, Systems analysis, *Multiple purpose reservoirs, Management, Monitoring, Algorithm.
Identifiers: *Trinity River Basin(Tex), Dynamic systems operation, Water quality monitoring network.

The goal was to determine the conceptual requirements of future data acquisition and monitoring instrumentation systems for the efficient operation and management of a highly developed river basin system. The Trinity River Basin in Texas is selected as an example system for specific recommendations. The complexity of the entire Trinity River system is evaluated and the feasibility of using a real-time data acquisition system on the Trinity River and its tributaries is considered. The current state of the art in management instrumentation is evaluated to ascertain the extent of practical feasibility and applicability on both the micro- and macro-scale environments, i.e., the Dallas-Fort Worth area and the entire Trinity River Basin, respectively. An algorithm was developed for finding the optimal management policies for the dynamic operation of a system of multipurpose reservoirs, tertiary wastewater treatment plants, wastewater retention basins, and navigation locks and dams. This management procedure is designed to interface with a real-time water quality monitoring system so that operating policies can be adjusted to reflect changing environmental conditions.

DEVELOPMENT OF AN AGRICULTURAL DRAINAGE GUIDE,
Soil Conservation Service, Berkeley, Calif.
G. L. Dickey, and W. R. Johnston.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 16, No 1, p 97-99, January-February, 1973. 6 fig, 6 ref.

Descriptors: *Drainage, *Subsurface drainage, Tile drainage, Drainage systems, Drainage engineering, Drainage area, Drainage programs, *Design, *California.
Identifiers: *Drainage guide, Fresno County(Calif).

A simplified procedure for field investigation and design of subsurface drainage systems was developed for western Fresno County, California. Data were collected to a depth of 20 feet or more in deep soil in order to analyze the drainage problem. Standard soil surveys to the depth of 5 feet are of little value in determining drain depth requirements in deep soils; however, a correlation was found between 0 to 5-feet soil characteristics and the drainage coefficient. Existing drainage systems are needed for study and evaluation. This allows a drainage guide to be developed on actual drain performance. (Skogerboe-Colorado State)

SHALLOW DRAIN PERFORMANCE IN A HEAVY SOIL,
Agricultural Research Service, Brawley, Calif. Imperial Valley Conservation Research Center.
L. F. Hermsmeier.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 16, No 1, p 92-94, January-February, 1973. 3 fig, 5 tab.

Descriptors: *Drainage, *Subsurface drainage, Tile drainage, Drainage systems, Drainage engineering, Drainage area, Drainage programs.

Shallow drains installed at a 4-foot depth and 200-foot spacing in a clay and loamy clay soil removed only from 12 percent to 7.2 percent of the salt added by the irrigation water during four cropping seasons over a 2-1/2 year period. The small amount of salt removed by the drains, when combined with salt removed from the soil by the natural drainage, was sufficient to maintain a favorable salt balance. However, during the sugarbeet cropping season when only 7.2 percent of the salt added by the irrigation water was removed by the drains there was an unfavorable salt balance in the field. Shallow drains can provide the means for removing sufficient salt from the soil to maintain a favorable salt balance when combined with natural drainage and good irrigation practice. HERBIVOROUS FISH FOR AQUATIC PLANT CONTROL,
Waterways Experiment Station., Vicksburg, Miss.
E. O. Gangstad, J. J. Raynes, and R. M. Burress.
Available from the National Technical Information Service as AD-765 437; $4.75 in paper copy, $1.45 in microfiche. Aquatic Plant Control Program, Technical Report 4, June 1973. 150 p, 9 fig, 47 tab, 90 ref.

Descriptors: *Aquatic weed control, *Biocontrol, *Carp, *Herbivores, Aquatic plants, Arkansas, Florida, Georgia, Albama, California, Spawning, Stocking, Algae, Hatching, Fish genetics, Breeding, Fish, Fish reproduction, Fish harvest, Fish diets.
Identifiers: Israeli carp, White amur, Ctenopharyngodon idella, Hypophthalmichthys molitrix, Grass carp, Chinese carp, Indian carp, Catla catla, Labeo rohita, Cirrhina mrigala, Mylopharyngodon piceus, India.

Efficiency of white amur fish (Ctenopharyngodon idella) as a biological control agent of aquatic weed populations in natural habitats is determined and effects of space and plant nutrients resulting from destruction of weeds evaluated. Research was conducted in Arkansas, Florida, Georgia, Alabama, and California, and India. The artificial diploid gynogenesis method undoubtedly will be useful in selection of heterosis combinations. Such heterosis will evidently be possible in crossing of the 'topcross' type. In the preliminary study, spawning was successful during May after water temperatures reached 75F, little success was attained after water temperatures reached 87F. The white amur fish appears promising as an efficient agent for converting troublesome aquatic plant growth into a useful product, i.e., fish protein. Effects at various stocking rates on channel catfish and striped bass, and aquatic plants were determined. Benefits are shown of using white amur where biological methods of weed control are preferable to chemical methods. Apparently white amure do not pose a competitive threat for food organisms eaten by gamefish. Feasibility of successful hybridization of Chinese carp with Indian carp and vice versa indicates that hybrids of selected desirable qualities could probably be produced. The nutritional preferences are described. (Jones-Wisconsin)

POTENTIAL OF WESTLAND'S MORAINIC SOILS FOR FOREST MANAGEMENT,
New Zealand Forest Service, Hokitika.
R. J. Coker.

N Z J For. Vol 17, No 2, p 224-231, 1972. Illus.
Identifiers: Deposits, *Forest management, *Morainic soils, *New Zealand(Westland), *Pleistocene, Podocarps, Soils.

More than 160,000 ha of lowland areas of the West Coast of the South Island of New Zealand consist of soils derived from outwash gravels or deposits of Pleistocene age. Over half this area is State forest land-much of it derelict following colonial-type exploitation of the high volume indigenous forests it once carried. Fires, excess surface water, lack of seed trees, and exposure have contributed to poor regeneration of podocarps, and to a large extent these areas are wastelands with no definite management policy. Management of the remaining well-forested terraces is being mastered by selection logging techniques which allow production without further contributing to management problems. An evaluation of species on the better sites in Mahinapua State Forest, which was planted with exotics during the late 1920s and early 1930s, indicates that these soils have potential for exotic production forest provided that only better sites are utilized and and a silvicultural regime is adopted which maximizes diameter growth.--Copyright 1973, Biological Abstracts, Inc.

THE AGE DYNAMICS AND THE ECONOMIC SELECTION CUTTINGS IN BROAD LEAVED DARK CONIFEROUS FORESTS OF THE WATER PROTECTIVE SHELTERBELT OF THE UFA RIVER WITHIN THE SVERDLOVSK REGION, (IN RUSSIAN),
E. P. Smolonogov.
Tr Inst Ekol Rast Zhivotn Ural Fil Akad Nauk SSSR. 77 p 117-134, 1970.
Identifiers: Age, *Coniferous forests, *Cuttings(Broad-leaf), *Economics, *Forests, Maturity, Mortality, Rivers, Shelterbelt, Stands, *USSR(Ufa River), Volume, Water.

In the shelterbelt of the Ufa River, USSR, there are about 6,500,000 m3 of mature and overmature wood. In 1953, regeneration cuttings were started in these forests. The change in the forest areas and in the mean stand volumes according to age classes for 1956-1966 s shown. Wood losses for that period amounted to 1,480,000 m3. On the basis of age structure dynamics, the standing volume and stand yield tables, a calculation was made of the magnitude of the natural mortality of the stands. Economic-selection cuttings are recommended, the intensity of which is based on the phases of quantitative maturity, natural maturity and renovation maturity of forests.--Copyright 1973, Biological Abstracts, Inc.

4B. Groundwater Management

GROUNDWATER GEOLOGY OF FORT VALLEY, COCONINO COUNTY, ARIZONA,
R. H. DeWitt.
In: Hydrology and Water Resources in Arizona and the Southwest, Proceedings of the 1973 meetings of the Arizona Section-AWRA, and the Hydrology Section-Arizona Academy of Science, May 4-5, 1973, Tucson, Arizona, p 41-43, (1973). 1 fig, 2 ref.

Descriptors: *Perched water, *Clays, *Groundwater, *Geohydrologic units, *Fractures(Geologic), Geology, Sandstones, Sedimentary rocks, Faults, Alluvium, Igneous rocks, Conglomerate rocks, Aquifers, Water table, Infiltration, Runoff, Recharge, Watersheds(Basins), Surface drainage, Limestones, Reservoirs, *Arizona, Impervious soils, Water wells, Water yield.
Identifiers: Interflow.

All groundwater in Fort Valley is presently found in perched aquifers. The regional water table in the area is estimated to lie at a depth of approximately 1750 feet. Groundwater reservoirs are perched on impermeable clay zones located at the base of alluvial units. Groundwater is also found in highly fractured volcanic zones overlaying impermeable clay zones. Perched aquifers also occur in interflow zones above either impermeable clays or unfractured volcanics. Groundwater in Fort Valley is the result of infiltration or runoff and from precipitation. This recharge water infiltrates the alluvium or fractured volcanic rocks until an impermeable zone is reached where it becomes perched groundwater. Greatest well yields come from these recharge aquifers; their reliability is largely dependent on precipitation and runoff. Most wells in the Fort Valley area supply adequate amounts of water for domestic use. (Mastic-Arizona)

QUALITY OF WELL WATERS OF JAIPUR DISTRICT,
Udaipur Univ. (India).
K. V. Paliwal, and A. P. Gandhi.
Annals of Arid Zone, Vol 11, Nos 1 and 2, p 41-49, March and June 1972. 6 tab, 25 ref.

Descriptors: *Irrigation wells, *Dissolved solids, *Water quality, *Groundwater, *Salinity, Hardness(Water), Water analysis, Water chemistry, Water properties, Water resources, Saline water, Saline water systems, Salts, Sodium, Boron, Electrical conductance, Ions, Anions, Cations, Cation adsorption.
Identifiers: *India(Rajasthan).

Chaksu Panchayat Samiti of the Jaipur district of India is a dry region in need of groundwater for irrigation. This study examines this water in terms of water quality in an attempt to determine its suitability to that end. Ninety-two wells were analyzed for the pertinent ions in solution and for electrical conductivity. The waters were classified in terms of total dissolved solids, sodium absorption ratio, boron and bicarbonate content. Boron class and salinity-SAR groups are determined. The waters have a wide concentration rage but are, for the vast majority of the samples, extremely saline with a high SAR. Their indiscriminate use in agriculture is not indicated, although controlled and managed irrigation is possible. Cation/anion ratios should be used as indications of water quality in the evaluation of irrigation water. (Muller-Arizona)

APPLICATION OF GEOCHEMISTRY TO THE SEARCH FOR CRUDE OIL AND NATURAL GAS,
Research Council of Alberta, Edmonton.
B. Hitchon.
In: Introduction to Exploration Geochemistry, Applied Publishing Ltd, Calgary, Alberta, Canada, Chapter 13. p 509-545, 1974. 17 fig, 5 tab, 128 ref.

Descriptors: *Geochemistry, *Exploration, *Oil fields, *Oil, Investigations, Water chemistry, Water circulation, Groundwater movement, Surveys, Organic matter, Chemical analysis, Canada.

Geochemistry may be applied at several stages during the exploration of sedimentary basins for crude oil and natural gas. During the initial stages, when few wells have been drilled and no commercial accumulations discovered, proper application of modern geochemical techniques provides reliable information on the petroleum generating potential of the basin and allows selection of the major source rock groups. Once hydrocarbons have been discovered it is important to classify the crude oils and natural gases into geochemical families having distinctive sources, hydrologic histories and timing of generation, migration and accumulation. In this manner geochemically related hydrocarbons may be sought in unexplored areas and different stratigraphic units. In the final stage of exploratory sophistication computer modeling of all available geolocal, geophysical, geochemical and hydrologic data may be used to seek out commercial accumulations. Practical application of geochemistry to the search for crude oil and natural gas can only be accomplished by extensive multicomponent analysis of fluids and rocks, together with a knowledge of hydrodynamics and a thorough understanding of the basic geology of the sedimentary basin, coupled with computer modeling of the geological, geophysical, geochemical and hydrologic history of the basin. PUBLIC GROUNDWATER SUPPLIES IN ADAMS COUNTY,
Illinois State Water Survey, Urbana. Hydrology Section.
D. M. Woller.
Bulletin 60-1, 1973. 21 p.

Descriptors: *Groundwater, *Water wells, *Aquifer characteristics, *Illinois, Data collections, Hydrologic data, Hydrogeology.
Identifiers: *Adams County(Ill).

All available information on production wells used for public groundwater supplies in Adams County, Illinois, is presented. Systems and wells described furnish water for drinking or general domestic use in: (1) incorporated municipalities; (2) unincorporated communities where 10 or more separate lots or properties are being served or are intended to be served; (3) state-owned parks and memorials; and (4) state-owned educational, charitable, or penal institutions. Descriptions are included for groundwater supplies of 8 municipalities, 2 subdivisions, and 1 state park in Adams County. Consolidated bedrock aquifers, principally the Keokuk-Burlington limestone, are tapped as a primary source of both private and municipal supplies throughout much of the entire county. The estimated production of all municipal wells finished in limestone aquifers of the county was 250,000 gpd in 1970. Water from the limestone varies in iron content from 0.0 to 3.6 mg/liter and from 68 to 348 mg/liter in hardness. The towns of Golden and Liberty aerate to remove hydrogen sulfide; none of the towns removes iron or softens the water. (Knapp-USGS)

VARIABLES AFFECTING WELL SUCCESS IN A KENTUCKY LIMESTONE AQUIFER,
Kentucky Univ., Lexington. Dept. of Geology.
J. T. Johnson, and J. Thrailkill.
Journal of Hydrology, Vol 20, No 4, p 327-333, December 1973. 1 fig, 1 tab, 12 ref.

Descriptors: *Water wells, *Water yield, *Water quality, Hydrogeology, Karst hydrology, Statistical methods, Stratigraphy, Surface-groundwater relationships, Limestones, Water levels, *Kentucky, Topography, Structural geology.

Variables significantly affecting groundwater supply in the Centerville Quadrangle, Kentucky were those directly related to lithology (wellhead stratigraphy and well-bottom stratigraphy) and those interpreted as being strongly influenced by lithology (well depth, wellhead elevation, and well-bottom elevation). In addition, wells judged adequate for water supply were closer to surface streams and bottomed closer to stream level than dry holes. Adequate wells were also closer to synclinal axes than dry holes. There was no signifi-

cant difference between holes and adequate wells in their distance from sinkholes or regional structural position. Wells producing water with H2S differed from adequate wells only with regard to variables related to lithology. Saline-water wells were more abundant in areas distant from surface streams as well as in unfavorable lithology. The ten variables studied were examined using nonparametric statistical tests (the Mann-Whitney U and the Chi-square tests). (Knapp-USGS)

RECORDS OF GROUND-WATER LEVELS IN WYOMING, 1940-1971,
Geological Survey, Cheyenne, Wyo.
B. H. Ringen.
Wyoming State Water Planning Program Report No 13, 1973. 479 p, 25 fig, 2 ref.

Descriptors: *Hydrologic data, *Water wells, *Water levels, *Wyoming, *Data collections, Water level fluctuations.

The U.S. Geological Survey, in cooperation with city, state, and other Federal agencies, has measured the depth to water periodically in a large number of wells in Wyoming since 1940. This report publishes, in a single volume, groundwater-level measurements that have been made in Wyoming in the period 1940-71 by the U.S. Geological Survey. Water-level measurements by other agencies in several of the same wells measured by the U.S. Geological Survey have been included, where available, to provide greater detail in a record, or to increase the length of a record. Generally, water-level measurements are for wells with a sufficient number of measurements to show a trend of fluctuations. (Knapp-USGS)

HYDROLOGIC CONDITIONS IN THE LAKELAND RIDGE AREA OF POLK COUNTY, FLORIDA,
Geological Survey, Tallahassee, Fla.
A. F. Robertson.
Florida Bureau of Geology Report of Investigation No 64, 1973. 54 p, 23 fig, 6 tab, 49 ref.

Descriptors: *Hydrogeology, *Florida, *Water levels, *Withdrawal, Water yield, Karst hydrology, Limestones, Water wells, Water quality, Saline water intrusion, Surface-groundwater relationships.
Identifiers: Lakeland(Fla).

In the Lakeland ridge area of Florida there has been an increase in groundwater pumpage from about 11 billion gallons in 1950 to 27 billion gallons in 1970. Decline in artesian water levels due to this pumpage is most pronounced in the southern part of the area of investigation where water levels have declined 50 feet or more in the last 20 years. The hazard of upward movement of water of poor quality is increased by the declines in freshwater level. Current water analyses reveal no widespread changes in quality of groundwater that can be correlated with water-level decline. The water levels of some lakes in the area were lower in June 1970 than in June 1961. A widespread zone of solution features in the limestone of the Floridan aquifer occurs at about 450 feet below mean sea level in the northeast part of the area of investigation and at about 650 feet below mean sea level in the south part of the area. Most wells open to this zone yield several thousand gpm with relatively small drawdowns. (Knapp-USGS)

Identifiers: Sullivan County(Ind), Busseron Creek(Sullivan County-Ind).

In the Busseron Creek watershed (Sullivan County, Indiana), surface waters are poor in both quality and quantity. Shallow wells in unconsolidated deposits and in Pennsylvania sandstones supply most of the rural domestic water needs, but most wells produce less than 10 gal/min. At least 6 potential sandstone aquifers of Pennsylvania age exist at depths ranging from 10 to 600 ft in thicknesses ranging from 1 to 104 ft. Although these sandstone bodies are considered as sheet sands, they are lenticular and mostly confined by shale above and below. Hence recharge of these aquifers is minimal, except where the sandstone body intersects the bedrock surface and is recharged by groundwater moving downward through the unconsolidated deposits. These sandstones are finely grained and well cemented. Their porosity ranges from 11 to 50%, calculated from electrical logs of oil and gas test holes. Their permeability coefficient is very low, ca. 0.04 gal/day/sq ft. Recorded well water production from sandstone averages less than 4 gal/min. Thus, the sandstones are poor aquifers and cannot furnish sufficient water for a small municipality, but may be used successfully by individual households. Deeper sandstones should be investigated. PUBLIC GROUNDWATER SUPPLIES IN BOND COUNTY,
Illinois State Water Survey, Urbana. Hydrology Section.
D. M. Woller.
Bulletin 60-3, 1973. 9 p.

Descriptors: *Groundwater, *Water wells, *Aquifer characteristics, *Illinois, Data collections, Hydrologic data, Hydrogeology, *Water supply, Potable water.
Identifiers: Bond County(Ill).

All available information on production wells used for public groundwater supplies in Bond County, Illinois, is presented. Systems and wells described furnish water for drinking or general domestic use in: (1) incorporated municipalities; (2) unincorporated communities where 10 or more separate lots or properties are being served or are intended to be served; (3) state-owned parks and memorials; and (4) state owned educational, charitable, or penal institutions. Descriptions are included for groundwater supplies of 3 municipalities in Bond

County. These are preceded by brief summaries of the groundwater geology of the county and the development of groundwater sources for municipal use. Unconsolidated sand and gravel deposits associated with the valleys of the East Branch of Shoal Creek and Beaver Creek are tapped as the sources for the three municipal supplies in Bond County. At Greenville, Mulberry Grove, and Pocahontas, there are presently 9 municipal wells tapping these aquifers to depths ranging from 31 to 74 ft. Their reported yields range from 12 to 250 gpm depending primarily upon the type of well and the permeability, thickness, and areal extent of the sand and gravel unit tapped by each well. Production from these wells was estimated to be 335,000 gpd in 1972. Analyses of water they produce indicate that the iron content ranges widely (from 0.0 to 36 mg/liter) and the hardness from 80 to 508 mg/liter. Groundwater for all the municipal supplies is chlorinated and fluoridated. In addition, water for Mulberry Grove and Pocahontas is aerated, settled, and filtered for iron removal, and at Pocahontas the pH is adjusted. (Knapp-USGS)

RELATIONSHIP BETWEEN LOGGING ACTIVITIES AND SALMON PRODUCTION,
Alaska Dept. of Fish and Game, Juneau.
A. P. Kingsbury.
Available from the National Technical Information Service as COM-73-11630; $5.00 in paper copy, $1.45 microfiche. National Marine Fisheries Service Report No. NOAA 73090605, April 1973. 59 p, 13 fig, 1 tab, 33 ref, 10 append. 5-24-R.

Descriptors: *Sedimentation, *Lumbering, *Salmon, *Productivity, Bottom sediments, Pink salmon, Fry, Streams, *Alaska, Spawning, Dissolved oxygen, Seasonal, Gravels, Fish eggs, Road construction, Streamflow.

Effects of logging and road building on stream flow, water temperature and debris on salmon egg and fry production were assessed quantitatively and additional data obtained on sediment content of spawning gravel, intra-gravel, dissolved oxygen and salmon abundance. Studies were conducted at 108 Creek and Kadashan Creek in southeastern Alaska. Spawning bed sediment and dissolved oxygen and pink salmon survival data were assembled and are discussed in relation to logging and road building. Fine sediment in three 108 Creek study areas increased somewhat irregularly over the first six years of the study and did not change appreciably in the following three years. Analysis of the relationship between amount of fine sediment and dissolved oxygen content within the gravel in the streams was inconclusive. Decreases in fine sediments were usually associated with high stream flow and high spawner density. Estimates of overwinter survival of pink salmon were too imprecise and are affected by too many factors for use as a measure of land use effectson pink salmon production. Intra-gravel sediment and dissolved oxygen data were highly variable within and between Kadashan Creek study areas. Effects of logging and roading on the pink salmon production were difficult to demonstrate. (Jones-Wisconsin)

EFFECT OF GRAZING ON RUNOFF FROM TWO SMALL WATERSHEDS IN SOUTHWESTERN WISCONSIN,
Forest Service (USDA), La Crosse, Wis. Watershed Lab.
R. S. Sartz, and D. N. Tolsted.
Water Resources Research, Vol 10, No 2, p 354-356, April 1974. 3 fig, 2 tab, 1 ref.

Descriptors: *Rainfall-runoff relationships, *Grazing, *Water yield, Land use, *Small watersheds, Hydrograph analysis, *Wisconsin.

Storm runoff from two small open pasture watersheds was measured for 11 years; during the first 7 years both were grazed, and during the last 4 years only one was grazed. Their runoff behavior was similar when both were grazed, but by the third year after cessation of grazing, runoff from the ungrazed watershed had dropped sharply. The ungrazed/grazed ratio for mean total flow had dropped from 1.17 to 0.10 and for mean peak flow from 0.82 to 0.03. After 3 years without grazing a heavy mat of bluegrass blanketed the ground, and soil bulk density was significantly lower. (Knapp-USGS)

CONTROL OF GRADING PRACTICES IN THE CITY AND COUNTY OF HONOLULU,
Honolulu City and County Dept. of Public Works, Hawaii.
R. Chun.
In: Hawaii Univ., Honolulu, Water Resources Research Center, Water Resources Seminar Series No. 2, December 1972, p 85-88,

Descriptors: *Erosion control, *Grading, *Legislation, *Hawaii, Control, Rockslides, Landslides.
Identifiers: *Honolulu(Hawaii).

Early grading operations ordinances in the City and County of Honolulu may have been the result of early subdivision planning which had little or no concern for potential landslides which might result, and which lead to events threatening the safety of human lives and caused severe property damages. The existing ordinance presently controlling grading activities was passed in 1955. Its primary feature was the adding of control over grubbing and stockpiling operations. Most recent changes in regulations are concerned with broader environmental concerns, including drainage and erosion control plans, sediment control, and broader planning requirements which provide for explicit consideration of alternative plans that would minimize grading. Geological Survey, Menlo Park, Calif.
D. F. Goerlitz, and L. M. Law.
Journal of the Association of Official Analytical Chemists, Vol 57, No 1, p 176-181, 1974. 1 fig, 2 tab, 21 ref.

Descriptors: *Chlorinated hydrocarbon pesticides, *Bottom sediments, *Suspended load, *Chromatography, *Insecticides, Adsorption, Sorption, Analytical techniques, *Pollutant identification.

Chlorinated hydrocarbon insecticides in suspended sediment and bottom material were extracted with acetone-hexane solvent, with the extractants added separately. Co-extractives, including polychlorinated biphenyls and polychlorinated naphthalenes, were isolated by adsorption chromatography. Sulfur is removed by precipitation. Mean recoveries from 8 spiked samples ranged from 75% to 99% for 9 chlorinated hydrocarbon insecticides. An average recovery of 97.9% was obtained for bottom material samples contaminated with chlorinated hydrocarbons. (Knapp-USGS)

Descriptors: Water pollution sources, *Oil spills, Chemicals, *Remote sensing, *Aerial photography, Cloud cover, *Pollutant identification, Weather data.
Identifiers: *Sub-optimum weather, Hazardous materials.

Multi-band aerial photography was acquired during specified conditions of cloud cover and reduced visibility considered to be representative of a nearly infinite range of sub-optimum weather conditions. (For aerial photography, optimum is defined as clear skies and greater than 15 miles visibility.) Basic techniques were derived from an earlier study designed to yield strategic spill prevention surveillance. (Welch, et al. 1972) Results indicated that only one film tested, a high sensitivity color positive film, provided consistently interpretable results. Rapid access techniques were also evaluated leading to recommendations for a tactical system providing a capability for both real-time and near real-time system update during sub-optimum aerial photographic conditions. Identifiers: Pentachlorophenol, Chlorine compounds.

In a sensitive and reliable procedure for the routine determination of pentachlorophenol (PCP) in waters, the PCP is extracted from the preserved sample with benzene and thence into a potassium carbonate solution. The addition of acetic anhydride to the aqueous solution produces PCP acetate which is extracted with hexane and analyzed by electron capture gas-liquid chromatography. Typical PCP concentrations determined in lake waters, sewage, and a pulp mill effluent are presented, along with the retention times of 17 other phenolic acetates. The new procedure can detect concentrations of PCP as low as 0.01 ppb per liter of water. (Brown-IPC)

Descriptors: *Water analysis, Rivers, *Indiana, Surface waters, Water temperature, Conductivity, Iron, Lead, Sodium, Zinc, Dissolved oxygen, Chlorides, Fluorides, Hydrogen ion concentration, *Pollutant identification, *Dissolved solids.
Identifiers: *Wabash River(Ind), *Lost Creek(Ind), Vigo County(Ind).

The surface waters of Lost Creek and the Wabash River were sampled February-May 1972 at several sites in Vigo County, Indiana. Dissolved and total concentrations of Fe, Pb, Na, and Zn were measured. The river stage, water temperature, specific conductance, pH, and concentrations of chloride and fluoride ions and dissolved oxygen were also determined. Fluoride, Fe, Pb, and Zn concentrations were higher in the Wabash River than in Lost Creek, whereas the pH and Na concentration were higher in Lost Creek than in the Wabash River. (Brown-IPC)

Identifiers: Health, Drinking water standards, Cadmium-Organic complexes, Storrs(Conn).

sewage treatment plant and household drink-
water supplies in the Storrs, Connecticut area
e been monitored for the cadmium content.
mium was not present in concentrations above
drinking water standard of 10 mg/l and there-
, does not appear to pose a serious water pol-
on problem at this time in these places. Tenfold
centrations by evaporation were used for
lyses by an Atomic Absorption Spec-
hotometer in order to be well above sensitivity
ts. Controls, cadmium spiked in the waters and
age gave 90% plus recoveries by this
nique. In addition to the possibility that cadmi-
may not be present in water supplies to begin
, the absence of cadmium could be due to the
ence of trace amounts, less than 1 mg/l, of
ides and the formation and precipitation of ex-
ely insoluble complex-breaking sulfide com-
nds. It is recommended that ferrous sulfide be
sidered for addition to conventional sewage
tment so as to make sulfide ions readily availa-
to react with certain heavy metals present, like
mium, thus removing them from waters. A
rature review is presented on the health effects
race amounts of cadmium present in the en-
nment and bases for toxicity criteria on cadmi-
are quantitatively presented. (Helfgott-Con-
ticut)

on spectrophotometry, *Bioaccumulation,
uscle, Liver, Brain, Brain, Kidneys, Gastric
ntents, Organic mercury.

ne gram of muscle, liver, brain, kidney, and gas-
ic content of fish, or about half of the organ
eighing less than 2 g was homogenized in a
osphate-buffer solution (pH 8.6, 1/16 M), and
alyzed for inorganic mercury by cold vapor
omic absorption photometry. Weight of fish and the level of total mercury are independent of the inorganic mercury percentage. Comparing the values in the muscle, both inorganic mercury percentages and levels of total mercury are elevated in the liver and kidney. The total mercury content in the liver, excluding the data on fish from the Japan Sea, is also significantly correlated with body weight but this is not seen in the case of the kidney. The data on the brain are difficult to interpret both regarding the level of total mercury and the inorganic mercury percentage. The level of total mercury of the gastric content is markedly higher in greenlings from the Japan Sea than in other fishes from the South China Sea, which means a difference in the mercury level in the habitat, and may contribute to the differing relationships between body weight and the total mercury level in the muscle and liver. The pattern of bodily distribution changes depending on the chemical form of mercury. In the case of inorganic mercury, three significant correlation coefficients are found, that is, 'kidney' vs 'muscle' and 'liver', and 'liver' vs 'brain'. There is a different pattern for organic mercury. The distribution pattern of total mercury is similar to that of organic mercury. (Holoman-Battelle)

MASS AND CHARGE TRANSFER KINETICS AND COULOMETRIC CURRENT EFFICIENCIES. PART VIII. SINGLE-SCAN VOLTAMMETRY OF VANADIUM(V) - VANADIUM(IV) IN THE PRESENCE OF CHROMIUM, MANGANESE AND IRON, AND THE KINETIC PARAMETERS OF THE VANADIUM SYSTEM, AT PLATINUM ELECTRODES PRE-TREATED BY FIVE METHODS,

Exeter Univ. (England). Dept. of Chemistry.
E. Bishop, and P. H. Hitchcock.
Analyst, Vol 98, No 1169, p 563-571, August 1973. 6 fig, 1 tab, 7 ref.

Descriptors: *Kinetics, Heavy metals, Cations, Electolytes, Electrochemistry, Chromium, Manganese, Iron, Electric currents, Efficiencies, Zeta potential.
Identifiers: *Platinum electrodes, *Single scan voltammetry, *Charge transfer, *Mass transfer, *Vanadium, Ionic interference, Pretreatment methods, Coulometric currents, Electrochemical reactions.

Continuing the earlier examination of the vanadium system alone, under various conditions and with various electrode pre-treatments, the effect of neighboring steel-forming d-block elements has been investigated. Chromium(VI) at pH 4.0 suppresses the vanadium(V) reduction wave, and the degree of suppression is quantitatively proportional to the chromium(VI) concentration. Activated electrodes are deactivated by dipping them in a chromium(VI) solution, and remain so even when well washed thereafter, so that chromium(VI) as well as chromium(III) is absorbed strongly on platinum. In 2.0 M sulphuric acid, chromium(VI) and vanadium(V) are reduced at the same rate. Manganese(VII) in acetate buffer gives a fast, well separated wave, but the separation is not as good in 2.0 M sulphuric acid; slowing the vanadium(V) reduction by using an oxidized electrode effects no improvement: the manganese wave is similarly affected. Addition of chromium(VI) to the manganese - vanadium mixture at pH 4 suppresses the manganese wave only slightly, even when the vanadium wave is completely suppressed. In 2.0 M sulphuric acid, the manganese wave is undistorted and chromium and vanadium are simultaneously reduced. Iron(III) in 2.0 M sulphuric acid does not interfere, but the separation of the vanadium and iron waves is not good. Iron(II) can, however, act as a potentiostatic intermediate. The kinetic parameters of the vanadium system are reproducible in acetate buffer, but only when the electrode is fouled in 2.0 M sulphuric acid. Pattern theory and diffusion-corrected Lewartowicz methods give results that agree. The charge-transfer kinetic parameters are shown to be potential dependent in acidic media. The results are compared with those in earlier reports. The generation current efficiency for vanadium(IV) in acetate buffer was computed. (See also W74-07557) (Holoman-Battelle)
W74-07558

A NEW COLORIMETRIC PROCEDURE FOR THE DETERMINATION OF BENOMYL,

Norges Landbrukshoegskole, Vollebekk. Chemical Research Lab.
J. Kvalvag.
Bulletin of Environmental Contamination and Toxicology, Vol 10, No 3, p 137-139, September 1973. 1 tab, 4 ref.

Descriptors: *Colorimetry, *Pollutant identification, Fungicides, Aqueous solutions, Hydrolysis, Separation techniques, Fruit crops, Vegetable crops, Pesticide residues.
Identifiers: *Benomyl, Metabolites, 2-Aminobenzimidazole, Cleanup, Sodium hypochlorite, Sample preparation.

A colorimetric procedure for the combined determination of the fungicide benomyl and metabolites hydrolyzable to 2-aminobenzimidazole is described. The prodcedure is based on the intense blue color that appears when hypochlorite or hypobromite is added to an aqueous solution of 2-aminobenzimidazole. An extraction, hydrolysis, and cleanup prodecure described elsewhere is used. The final evaporation is halted when sufficient ethyl acetate has evaporated to leave an essentially aqueous solution. This solution is poured into a 10 ml centrifuge tube, the beaker is washed with 3 ml hot water, and this is added to the solution in the tube. After cooling, the volume is adjusted to 5 ml and part of the contents is transferred to an optical cell. Measurement is made at 560 nm against water, and the sample discarded if absorbance is higher than 0.015. Two drops of sodium hypochlorite are added to an acceptable solution, and the cell is placed quickly in the colorimeter compartment. The absorbance is compared with a standard curve. If the uncertainty span is confined to three times the absorbance mentioned above, the limit of detection is slightly above 2 micrograms/ml 2-aminobenzimidazole which corresponds to 0.5 ppm benomyl in a 50-g sample based on a 5 ml final volume. In order to check precision of the method four different crops were fortified with 2 ppm of benomyl and analyzed. (Mortland-Battelle)

MULTIPLE ORGANOCHLORINE PESTICIDE RESIDUES IN JAPAN,
Kitakyushu Municipal Inst. of Public Health (Japan).
M. Suzuki, Y. Yamato, and T. Watanabe.
Bulletin of Environmental Contamination and Toxicology, Vol 10, No 3, p 145-150, September 1973. 3 fig, 3 tab, 14 ref.

Descriptors: *Pesticide residues, *Soils, *Gas chromatography, Aldrin, Dieldrin, Endrin, DDE, DDT, Vegetable crops, Soil analysis, DDD.
Identifiers: BHC, *Japan(Kyushu district), Sample preservation, Sample preparation, Isomers.

Organochlorine pesticide residues were analyzed in agricultural soil of the Kyushu district in Japan. Soil samples were taken 15 cm deep, stored at -30C, then air dried, pulverized, screened in a 20-mesh sieve, and mixed. For analysis, one hundred grams of dry soil was mixed with a 0.70 volume of water in a high speed mixer and deactivated for 30 min. After this treatment, 200 ml of acetonitrile was added and blended at a high speed for 5 min. An extract was filtered, and the filtrate was poured into a 1 liter separatory funnel, shaken with 100 ml of n-hexane for 5 min., and partitioned with 600 ml distilled water by shaking for 1 min. Then the n-hexane layer was washed twice with 100 ml distilled water. The n-hexane layer was dried. The column was rinsed twice with approximately 5 ml of n-hexane, and washings were mixed into the layer. The dried n-hexane solution was applied to a gas chromatograph equipped with a tritium foil electron capture detector. Gas chromatographic determination was carried out by combining three different columns. The typical multiple organochlorine pesticide residues in soil are given. Alpha-, beta-, gamma-, and delta-BHC were detected in all 99 soil samples. Considerable residual amounts of aldrin, dieldrin and endrin and high residual levels of DDT and its related compounds were detected. (Mortland-Battelle)

Descriptors: *Yeasts, *Marine fish, *Pathogenic fungi, *Isolation, Nutrient requirements, Fish, Hosts, Temperature, Vitamins, Speciation, Cultures, Methodology, Herrings.
Identifiers: *Psychrophilic fungi, Culture media, Deuteromycetes, Candida scotti, Debaryomyces hansenii, Candida tropicalis var. lambica, Cryptococcus diffluens, Cryptococcus laurentii, Torulopsis famata, Torulopsis sake, Trichosporon pullulans, Rhodotorula glutinis, Rhodotorula mucilaginosa, Rhodotorula infirmo-miniata, Whiting, Skate, Haddock, Halibut, Flounder, Lemon sole.

Yeasts were isolated from marine fish using low incubation temperatures. The isolates were screened for their ability to grow at 4 C and 30 C. Isolates growing at 4 C but not at 30 C were considered to be psychrophilic and were selected for further study. Approximately 25 percent of the isolates were in this category. The isolates comprised the following genera: Candida, Cryptococcus, Debaryomyces, Rhodotorula, Torulopsis and Trichosporon. Rhodotorula infirmo-miniata accounted for 50 percent of the isolates and Trichosporon pullulans 10 percent. Other species were present in numbers below the 10 percent level. The distribution of the species between the two sample areas is discussed. The vitamin requirements and optimum growth temperatures of the isolates were assessed. (Holoman-Battelle)

SOLVENT EXTRACTION OF SULFUR FROM MARINE SEDIMENT AND ITS DETERMINATION BY GAS CHROMATOGRAPHY.
University of Southern California, Los Angeles, Environmental Engineering Program.
K. Y. Chen, M. Moussavi, and A. Sycip.
Environmental Science and Technology, Vol 7, No 10, p 948-951, October 1973. 4 fig, 2 tab, 14 ref.

Descriptors: *Sulfur, *Solvent extractions, *Separation techniques, *Sediments, *Gas chromatography, Colorimetry, Soil analysis, Pollutant identification,
Identifiers: Comparative techniques, Sample preservation, Sample preparation, Detection limits.

The feasibility of elemental sulfur extraction and analytical determination by gas chromatography (gc) is examined. To get maximum response from the gc, various experiments were performed using different parameter settings. The operating conditions at which optimum responses for sulfur were obtained were: injection port temperature - 220 C, oven column temperature - 190 C, EC detector temperature - 265 C, and gas flow - 84-90 ml/min. At these settings, after injection of standards or extracts, the predominant sulfur species eluted were S4, S6, and S8. The S8 species exhibits the largest area and peak height. The recovery of sulfur from sediment was carried out initially with a sediment sample of unknown sulfur content. The purpose was to evaluate the efficiency of different solvents in recovering sulfur and to evaluate their suitability for subsequent determinations by both colorimetry and chromatography. Only benzene and toluene exhibited high recovery efficiencies and showed consistent results in both methods. The detection limit of the method described was at the picogram level, unmatched by other known methods. Neither the coefficient of variation nor mean values for sulfur were significantly different in comparisons between the gc method and a standard colorimetric method. (Mortland-Battelle)

THE BACTERIAL FLORA OF THE ATLANTIC SALMON (SALMO SALAR L.) IN RELATION TO ITS ENVIRONMENT,
Torry Research Station, Aberdeen (Scotland).
R. W. Horsley.
Journal of Applied Bacteriology, Vol 36, No 3, P 377-386, September 1973. 4 fig, 3 tab, 29 ref.

Descriptors: *Atlantic salmon, *Aerobic bacteria, *Pollutant identification, Methodology, *Bioindicators, *Water quality, Estuarine environment, Fungi, Aquatic environment, Rivers, Coasts, Water analysis, Fishing, Pseudomonas, Enteric bacteria, Yeasts.
Identifiers: Skin, *Heterotrophic bacteria, Gills, Marine environment, Viable count, Swab technique, Sampling technique, Animal tissues, Salmo salar, Culture media, Moraxella, Acinetobacter, Flavobacterium, Cytophaga, Bacillus, Vibrio, Aeromonas, Coryneform bacteria, Micrococcaceae, Enterobacteriaceae, Chromobacterium spp, Actinomycetes.

The aerobic flora of the skin of 56 Atlantic salmon from coastal, estuarine and river waters was analyzed quantitatively; 50 skin and 33 gill samples were analyzed qualitatively. The water at each sampling station was also analyzed. The principal genera on the skin and gills were Moraxella, Flavobacterium, Cytophaga and Pseudomonas; members of Acinetobacter, Bacillus, Aeromonas, Vibrio, the Enterobacteriaceae, Micrococcac and some coryneforms were also present. The flora was similar to that of the skin, w reflected that of the environment. (Holoman-B telle)

MOINA SP. (CLADOCERA: MOINIDAE) IN SEWAGE PLANT, WELLINGTON, REFERR TO MOINA TENUICORNIS SARS, 1896 (NOT
Wellington City Corp. (New Zealand). Wo Dept.
I. L. Vidal.
New Zealand Journal of Marine and Freshwa Research, Vol 7, No 3, p 253-259, September 19 1 fig, 1 tab, 6 ref.

Descriptors: *Systematics, *Water quali *Ecology, *Waterfleas, Water temperature, A kalinity, Hydrogen ion concentration, Dissolv solids, Biochemical oxygen demand, Orga matter, Sewage lagoons, Nitrates, Phosphor Speciation, Physiological ecology, Crustacea Scenedesmus, Chlamydomonas, Coliform Habitats.
Identifiers: *Moina, *New Zealand, Microtiniu Cryptomonas.

A species of Moina from sewage ponds at Gle side, Wellington, New Zealand, is identifi ble/with Moina tenuicornis Sars, 1896, and disti guishable from Moina australiensis Sars, 18 sensu stricto, in having rectangular sculpturing the ephippium, ungrouped setae on the hind ma gin of the carapace, and in lacking a permane supra-ocular depression. Because of wide vari tion in some diagnostic characters, possibly bo taxa are conspecific. Some physical and chemic characteristics of the habitat are tabulated, sinc little is known of the ecological requirements these morphologically similar species. Using mea values as a guide, the Glenside population Moina tenuicornis favors a temperature in th vicinity of 20 C, a very slightly alkaline pH, a di solved oxygen content in excess of 6 mg.liter, dissolved solid content of about 270 mg/liter, which about half is organic and exerts a BOD sub of about 60 mg/liter, and suspended organic solid of about 150 mg/liter. SUMMARY OF THE STATE OF THE ART IN RADIOCHROMATOGRAPHY,
Oslo Univ. (Norway). Inst. of Physics.
S. Prydz.
Analytical Chemistry, Vol 45, No 14, p 2317-2326, December 1973. 12 fig, 2 tab, 54 ref.

Descriptors: *Reviews, *Carbon radioisotopes, *Tritium, Radiochemical analysis, *Radioactivity techniques, Computers, Prices, Films, Cameras.
Identifiers: *Radiochromatography, Film registration, Fluorography, Detectors, Luminescence, Photon detector, Scintillators, Image intensifiers, Scanners, Beta camera, Spark chamber, Beta particles.

Film registration in radiochromatography is discussed. Low-temperature fluorography gives

e lowest detection limits, 3.0 and 0.06 nCi-day/sq for tritium and radiocarbon, respectively. Vari- s detectors for one- and two-dimensional anning, comprising windowless gas-flow GM de- ctors, solid state detectors, and vacuum- erated channel electron multipliers are treated. e luminescence detection method, applying intillators in the chromatograph and a scanned oton detector, is discussed. For tritium, the ter method is about 30 times more efficient than M detection. Two radio-labels may be counted nultaneously using pulse height discrimination. e beta camera, the spark chamber, and the pos- ility of using image intensifiers are also scussed. The application of a computer to in- ease the signal-to-noise ratio and, hence the sen- ivity, of scanners is mentioned. A comparison the sensitivities of the available detection chniques and an appendix giving prices and chnical details of the commercially available anners are included. (Mortland-Battelle)

escriptors: *Chemical analysis, *Poultry, ethodology, Colorimetry, rsenicals(Pesticides).
entifiers: *Arsenic, *Chemical recovery, nimal tissues, Organoarsenicals, Arsenic trioxe, Dry ashing, Liver, Kidneys, Roxarsone, Arnilic acid, Nitarsone, Carbarsone, Arnobenzene.

study was conducted to establish whether or not senic recovery from animal tissue is independent arsenic source. Control chicken liver and kidey tissues were fortified with 1.0 or 2.0 ppm arnic from arsenic trioxide, roxarsone, arsanilic id, nitarsone, or carbarsone. The tissue samples ere dry ashed and total arsenic was determined olorimetrically. Arsenic recovery for the ornoarsenical-fortified tissue samples is essenlly complete for all drugs tested. Mean recovees ranged from 98 to 109 percent of the theoretil amount expected. (Holoman-Battelle)

escriptors: *Pollutant identification, *Soil analys, Methodology, *Pesticide residues, Carbamate esticides, Solvent extractions, Insecticides, Soil ontamination, Water pollution sources, *Gas hromatography, Soils, Loam, Peat, Chemical nalysis.
dentifiers: *Carbofuran, Electron capture gas hromatography, Chemical recovery, Metabolites, Detection limits, Landrin, Propoxur, Bux, Acid mmonium acetate.

A method is presented for determining carbofuran esidues in soils that gives improved recovery, specially in weathered soils, and allows quantitaion of as little as 0.1 ppm without cleanup. The oil is extracted with 0.5 M acid ammonium cetate and the carbamate in the extract is determined by electron capture gas chromatography as the dinitrophenyl ether. A systematic study was conducted to optimize extraction conditions. In tests of soils fortified with 1 ppm carbofuran, using optimized extraction conditions, recoveries varied with soil type, ranging from 61 percent in a peat to 92 percent in a silt loam. Recoveries of the metabolites 3-hydroxy- and 3-ketocarbofuran from field soils were at least as efficient as by HCl extraction. In addition to carbofuran, other methylcarbamate insecticide residues that may be determined by this method include Landrin, propoxur, and Bux. (Holoman-Battelle)

OBSERVATIONS ON THE GAS CHROMATOGRAPHY OF KELTHANE (DICOFOL),
Food and Drug Administration, Washington, D.C. Div. of Chemistry and Physics.
N. F. Ives.
Journal of the Association of Official Analytical Chemists, Vol 56, No 6, p 1335-1338, November 1973. 4 fig, 12 ref.

Descriptors: *Degradation(Decomposition), *Gas chromatography, Mass spectrometry.
Identifiers: Gas liquid chromatography, *Kelthane, *Sample preparation, Dichlorobenzophenone, Infrared spectrophotometry, Electron capture detector.

Problems associated with the GLC of Kelthane (dicofol) are discussed. The contribution of inlet glass wool to the decomposition of dicofol to p,p'-dichlorobenzophenone is investigated and steps to minimize the problem are suggested. An impurity of the technical material, which eluted immediately after dicofol, was isolated and tentatively identified as 1,1-bis(p-chlorophenyl)-1,2,2,2-tetrachloroethane by infrared and mass spectrometry. REDUCTION IN MERCURY CONTENT OF FISH PROTEIN CONCENTRATE BY ENZYMATIC DIGESTION,
Massachusetts Inst. of Tech., Cambridge. Dept. of Nutrition and Food Science.
M. C. Archer, B. R. Stillings, S. R. Tannenbaum, and D. I. C. Wang.
Journal of Agricultural and Food Chemistry, Vol 21, No 6, p 1116-1117, November/December 1973. 1 tab, 10 ref.

Descriptors: *Mercury, *Reduction(Chemical), *Digestion, Proteins, Separation techniques, Enzymes, Centrifugation, Fish.
Identifiers: *Fish protein concentrate, *Proteolysis, Sample preparation, Swordfish, Pacific hake.

The effect of proteolytic digestion on the distribution of mercury in fish protein concentrate (FPC) has been investigated. A two- to sevenfold concentration of mercury in the insoluble FPC fraction and a corresponding reduction of mercury level in the soluble FPC fraction was achieved after proteolysis. The following commercial enzyme preparations were used: Pancreatin, B grade (porcine pancreas), Calbiochem; Pronase, B grade (Streptomyces griseus), Calbiochem; and Monzyme PA-I (Bacillus subtilis), Monsanto. FPC samples were prepared from either Pacific hake (Merluccius productus) or swordfish (Xiphias gladius). Ten percent slurries of FPC were digested for periods of 1 and 6 hr at 50 C with Monzyme at pH 8.8 and with Pronase and Pancreatin at pH 8.5. After digestion for 1 or 6 hr, the reaction was stopped by pouring the mixture into two 50-ml centrifuge tubes and spinning down the residue at 4 C for 5 min and 5090 X g. The residue was suspended in distilled water and recentrifuged. The clear supernatants were combined and freeze-dried after most of the water was removed by flash evaporation at a bath temperature of 40 C. The residue was also freeze-dried. The soluble and insoluble fractions were then analyzed for mercury content. (Mortland-Battelle)

KAEMPFEROL (3,5,7,4'-TETRAHYDROXYFLAVONE) AS A CHROMOGENIC REAGENT FOR TIN(IV),
Delhi Univ. (India). Dept. of Chemistry.
B. S. Garg, and R. P. Singh.
Microchemical Journal, Vol 18, No 5, p 509-519, October 1973. 8 fig, 3 tab, 14 ref.

Descriptors: *Spectrophotometry, *Aqueous solutions, Methodology, *Pollutant identification, Color reactions, Chemical reactions, Chelation, Acidity, Temperature, Time, Cations, Anions, Heavy metals, Organic compounds, Alkaline earth metals, Halides.
Identifiers: *Tin, *Chromogenic reagents, *Kaempferol, Metal chelates, Ionic interference, Sensitivity, Precision, Chemical concentration, Ethanol, Absorption spectra, Rare earth elements.

Tin(IV) forms a deep yellow chelate with the ligand kaempferol in aqueous ethanolic medium. This color reaction has been investigated in terms of using it for the spectrophotometric determination of tin. Those parameters studied were acidity, ethanol, time and temperature, reagent concentration. With the method used, the sensitivity of the color reaction 0.0029 microgram of Sn/sq cm is identical to log I sub o/I equals 0.001, at 430 nm in 0.1 N HCl medium and Beer's law is obeyed up to 3.6 ppm of tin. Several complexing anions do not interfere and they have been used for masking some of the cations which interfere in the determination. (Holoman-Battelle)

MICRODETERMINATION OF RESORCINOL IN PRESENCE OF PHENOL,
Pakistan Council of Scientific and Industrial Research Lahore.
M. Sarwar, and K-U. Butt.
Mikrochimica Acta, No 5, p 679-682, 1973. 2 tab, 12 ref.

Descriptors: *Phenols, *Volumetric analysis, *Aqueous solutions, Water analysis.
Identifiers: *Resorcinol, N-bromosuccinimide, Accuracy.

A displacement titration method using N-bromosuccinimide as the titrant has been devised for estimation of resorcinol in phenol. One ml of the resorcinol test solution is placed in a 50-ml Erlenmeyer flask. One ml of potassium iodide and 0.5-1.0 ml of fresh starch is added. The solution is titrated against 0.01 N solution of N-bromosuccinimide added dropwise from a microburette. The end point is reached when a bluish color appears and persists for 30 seconds. A similar procedure is repeated for the estimation of resorcinol in phenol. The method is very simple, rapid, and accurate. (Mortland-Battelle)

GAS CHROMATOGRAPHIC STUDIES OF MIXED-LIGAND COMPLEXES OF DIVALENT CATIONS,
Hewlett-Packard Co., Avondale, Pa. Avondale Div.
C. A. Burgett.
Journal of Chromatographic Science, Vol 11, No 11, p 611-614, November 1973. 5 fig, 1 tab, 6 ref.

Descriptors: *Cations, *Gas chromatography, *Solvent extractions, Iron, Cobalt, Nickel, Gravimetric analysis, Mass spectrometry, Separation techniques.
Identifiers: *Ligands, Thermogravimetric analysis, Thermal stability, Divalent cations, Chromatograms, Metal complexes, Metal chelates.

Volatile complexes of iron(II), cobalt(II) and nickel(II) are prepared by solvent extraction using the mixed-ligand system 1,1,1,2,2,6,6,7,7,7-decanfluoro-3,5-heptanedione, H(FHD), di-n-butylsulfoxide, (DBSO). The composition of the extracted species is reported to be M(FHD)2. DBSO. Thermogravimetric analysis of the complexes is reported. The complexes were eluted from the gas chromatographic column without decomposition as determined by mass spectrometric detection. Separation of iron(II) and cobalt(II) from nickel(II) was readily achieved; however, iron(II) and cobalt(II) were not separated. (Mortland-Battelle)

NUMERICAL ANALYSIS OF HANSENULA, PICHIA AND RELATED YEAST GENERA,
Heriot-Watt Univ., Edinburgh (Scotland). Dept. of Brewing and Biological Sciences.
I. Campbell.
Journal of General Microbiology, Vol 77, No 2, p 427-441, August 1973. 4 fig, 1 tab, 53 ref.

Descriptors: *Systematics, *Speciation, *Numerical analysis, *Yeasts.
Identifiers: Data interpretation, Debaryomyces, Pichia, Wingea, Endomycopsis, Hansenula, Pachysolen, Schwanniomyces, Lipomyces, Ambrosizyma, Brettanomyces, Citeromyces, Dekkera, Ladderomyces.

Numerical analysis of published standard descriptions of the eight species of Debaryomyces, 48 species of Pichia, and the single species of Wingea failed to distinguish separate genera. It is proposed that they be combined as a single genus Pichia of 41 species, three of which were formerly allocated to the genus Endomycopsis. The genus Hansenula, of 20 species including Pachysolen tannophilus and three former species of Endomycopsis, is closely related to the genus Pichia and is distinguished only by the ability of Hansenula species to assimilate nitrate. In the genus Schwanniomyces the number of species is reduced from four to two, and in Lipomyces, from three to one. (Little-Battelle)

RESIDUES OF ATRAZINE, CYANAZINE, AND THEIR PHYTOTOXIC METABOLITES IN A CLAY LOAM SOIL,
Ontario Ministry of Agriculture and Food, Guelph. Pesticides Residue Lab.
G. J. Sirons, R. Frank, and T. Sawyer.
Journal of Agricultural and Food Chemistry, Vol 21, No 6, p 1016-1020, November/December 1973. 6 fig, 2 tab, 11 ref.

Descriptors: *Clay loam, *Pesticide residues, *Degradation(Decomposition), *Triazine pesticides, Persistence, Phytotoxicity, Soil analysis, Herbicides, Methodology, Solvent extractions, Chemical analysis, Chemical reactions.
Identifiers: *Metabolites, *Coulson conductivity detector, Quantitative analysis, Chemical recovery, Atrazine, Cyanazine, Electrolytic conductivity gas chromatography, Deethylated atrazine, Deisopropylated atrazine, Cyanazine amide, Gas liquid chromatography.

The degradation of 2-chloro-4-ethylamino-6-isopropylamino-s-triazine (atrazine) and 2-chloro-4-(1-cyano-1-methylethylamino)-6-ethylamino-2-triazine (cyanazine) was investigated in Perth clay loam soil. Atrazine and cyanazine were applied at rates of 1, 2, and 3 lb/A of active ingredients as pre- and postemergence treatments. Soil was sampled from plots after 0, 2, 3.5, 5, and 12 months at 0-2.5, 2.5-5, and 5-10 in. depths. Atrazine, cyanazine, and their phytotoxic metabolites were extracted with a 65 percent acetonitrile-water mixture and quantitated on a Coulson conductivity detection system. Presented data indicate that atrazine is converted into deethylated atrazine (2-chloro-4-amino-6-isopropylamino-s-triazine) as a major and deisopropylated atrazine (2-chloro-4-amino-6-ethylamino-s-triazine) as a minor phytotoxic metabolite and that cyanazine is changed to deisopropylated atrazine as a major phytotoxic metabolite. Cyanazine amide (2-chloro-4-(1-carbamoyl-1-methylethylamino)-6-ethylamino-s-triazine) was found. It is proposed that the hydrolysis precedes the microbiological degradation to the deisopropylated atrazine. (Holoman-Battelle)
W74-07585

DETERMINATION OF MEAN CELL SIZE OF TETRAHYMENA IN GROWING CULTURES,
University Coll. of Wales, Aberystwyth.
G. A. Morrison, and A. L. Tomkins.
Journal of General Microbiology, Vol 77, No 2, p 383-392, August 1973. 7 fig, 1 tab, 4 ref.

Descriptors: *Cultures, *Populations, *Particle size, *Volume, Growth rates, Cytological studies, Aqueous solutions.
Identifiers: *Coulter counter, *Counting, Tetrahymena pyriformis, Size.

In this study of the actions of certain inhibitors on the growth of Tetrahymena pyriformis in deep culture it was necessary to make concomitant measurements of the number of mean cell size of the living organisms in a culture at intervals. To accomplish this, a Coulter model A was fitted with a 280 micrometer orifice tube to detect decreases in the conductance of a small volume of an aqueous electrolyte. When the setting correspond to detection of every particle, the total count was obtained. The counts at a number of different threshold settings were used to obtain a distribution of particle volume curve and hence to calculate the mean particle volume (electronic volume). The results show that the diluting solution can have an optimal colligative concentration in which there is initially no change of the measurement; in suboptimal concentrations there is initial increase followed by a decrease to a value somewhat less than that prevailing at the moment of dilution (95 percent), whereas in superoptimal concentrations there is initial decrease followed by an increase. If the initial decrease is severe the subsequent increase restores the value to only 80 percent of the original. The measurements of electronic volume, and of its changes reflect the corresponding mean cell volume, and changes of it, estimated by photographic methods. The changes can be accounted for by changes of balance between the elasticity of the cell walls and the osmotic pressure across the walls. (Little-Battelle)

ECOLOGY AND PRODUCTIVITY OF STRIP-MINE AREAS IN MERCER COUNTY, PENNSYLVANIA,
Grove City Coll., Pa. Dept. of Biology.
F. J. Brenner.
Available from the National Technical Information Service as PB-231 559, $4.00 in paper copy, $1.45 in microfiche. Pennsylvania Institute for Research on Land and Water Resources, University Park, Penn., Completion Report, March 1974. 70 p, 35 fig, 12 tab, 15 ref. OWRR A-029-PA(1), 14-31-0001-4038.

Descriptors: *Strip mines, *Ecology, *Aquatic life, *Fish populations, Water chemistry, Plankton, Reclamation, *Pennsylvania, Productivity, Recreation, *Land reclamation, Wildlife.
Identifiers: *Mercer County(Penn), Recreational development.

Abandoned strip mines were surveyed in Mercer County, Pennsylvania during 1971 and 1972. The general ecology of each strip mine site was determined and the water chemistry of each pool was analyzed. The majority of the strip mine pools within Mercer County are supporting aquatic life. The data on water chemistry, plankton surveys and age and growth of fish populations indicate that these areas offer considerable potential for recreational development. The results of this preliminary study will provide an excellent basis for further research on the fish and wildlife potential of these sites. Furthermore, this research suggests that cooperation between the mine operator, land owner and an ecologist could result in reclamation procedures beneficial for fish and wildlife populations.

CHEMICAL AND BIOLOGICAL PROBLEMS IN THE GRAND CANYON,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
G. C. Slawson, Jr., and L. G. Everett.
In: Hydrology and Water Resources in Arizona and the Southwest, Proceedings of the 1973 meetings of the Arizona Section - AWRA and the Hydrology Section, Arizona Academy of Sciences, May 4-5, 1973, Tucson, Arizona, p 63-72, (1973). 1 fig, 6 tab, 1 ref.

Descriptors: *Water quality, *Biological properties, *Colorado River, Water pollution sources, Chemicals, Bacteria, Pollutants, Tributaries, Public health, Sampling, Salinity, Sediments, Water quality standards.
Identifiers: *Grand Canyon National Park.

Chemical and bacteriological water quality in the Grand Canyon was investigated to determine possible health hazards to river users. Water quality is a function of both time and location and in general, the quality of water in the main river channel is relatively stable and appears to be within acceptable standards. Extreme temporal variability was noted in tributary streams, as a result of summer rains and flooding in the side canyons, and definite health hazards are present during these periods. A more intensive water quality monitoring program is called for to determine the sources of the contamination and to protect and preserve the quality of the Grand Canyon experience. (Mastic-Arizona)
W74-07093

DISSOLVED-SOLIDS DISCHARGE TO THE OCEANS FROM THE CONTERMINOUS UNITED STATES,
Geological Survey, Washington, D.C.
D. K. Leifeste.
Circular 685, 1974. 8 p, 1 fig, 2 tab, 6 ref.

Descriptors: *Dissolved solids, *Rivers, *United States, Data collections, Hydrologic data, Erosion, Water quality, Path of pollutants, Solutes, Oceans.

Dissolved-solids data from 54 river basins for 1966-69 were used to compute the amount of dissolved material contributed to the oceans from the conterminous United States. About 264,000,000 tons are discharged annually. The Gulf of Mexico receives the largest load, about 183,000,000 tons, of which about 157,000,000 tons are contributed by the Mississippi River. The Atlantic Ocean

receives about 37,500,000 tons, and the Pacific Ocean about 43,400,000 tons. Average yearly yields range from 26 to 231 tons per square mile and average about 100 tons per square mile. (Knapp-USGS)
W74-07162

SOURCE AND BUDGET OF SULFATE IN PRECIPITATION FROM CENTRAL ALBERTA, CANADA,
Research Council of Alberta, Edmonton.
P. W. Summers, and B. Hitchon.
Journal of the Air Pollution Control Association, Vol 23, No 3, p 194-199, March 1973. 6 fig, 1 tab, 8 ref.

Descriptors: *Sulfates, *Air pollution, *Path of pollutants, *Chemistry of precipitation, *Precipitation(Atmospheric), Snowfall, Rainfall, *Canada, Meteorology.
Identifiers: Alberta(Canada).

Rain, hail, and snow samples collected in central Alberta were analyzed for sulfate and chloride content. The mean values of sulfate concentration in rain and hail collected in the region of sulfur extraction gas plants were 2.7 mg/liter and 2.9 mg/liter, respectively. The mean value of the sulfate content of a large number of hail samples collected from one severe storm for a major SO2 source was 0.6 mg/liter. Several snow samples collected in Alberta and southern British Columbia had a mean sulfate content of less than 0.5 mg/liter. Most of the sulfate found in central Alberta precipitation is of local industrial origin. By comparing the sulfate deposition in precipitation around one isolated gas plant with the known SO2 emission rate, a local atmospheric sulfur budget was derived. The summertime convective storms are a very efficient mechanism for removing the SO2 from the atmosphere; between 32% and 46% of the sulfur emitted as SO2 arrives at the ground as sulfate sulfur within a radius of 25 miles of the source. In contrast snow is a very inefficient removal mechanism; in winter less than 2% of the sulfur emission is deposited in the snowfall near the source. (Knapp-USGS)

GEOLOGIC ASPECTS OF WASTE SOLIDS AND MARINE WASTE DEPOSITS, NEW YORK METROPOLITAN REGION,
State Univ. of New York, Stony Brook. Marine Sciences Research Center.
M. G. Gross.
Geol Soc Am Bull. Vol 83, No 11, p 3163-3176, 1972. Illus.
Identifiers: Carbon, Copper, Geologic aspects, Lead, Metropolitan areas, *New York Bight, Silver, *Solid wastes, *Waste disposal.

Waste solids from the New York metropolitan region were a major source of sediment to adjacent ocean areas from 1964-1968. The annual discharge of solids (excluding refuse and floatable debris) to the New York Bight averaged 4.6 million metric tons per yr: 76% from dredged wastes, 12% from construction and demolition rubble, 7.6% from solids in waste chemicals and 4.3% from sewage sludges. Waste containing deposits covered 160 km sq of New York Harbor and more than 50 km sq of continental shelf in New York Bight. The continental shelf area used for waste disposal received no other sediment in quantities sufficient to bury the waste deposits. Waste disposal operations were the largest sediment transport and depositional process active in the mid-Atlantic region. Production of waste solids in the metropolitan region exceeded sediment yields per unit area of any other major drainage basin in the new England-Middle Atlantic area.--Copyright 1973, Biological Abstracts, Inc.

COMPARISON OF CONDITIONAL STABILITY CONSTANTS OF NORTH CAROLINA HUMIC AND FULVIC ACIDS WITH CO(II) AND FE(III),
Geological Survey, Denver, Colo.
R. L. Malcolm.
In: Environmental Framework of Coastal Plain Estuaries; 18th Annual Meeting of Southeastern Section of the Geological Society of America, April 10-11, 1969, Columbia, S C: Geological Society of America, Inc, Memoir 133, p 79-83, 1972. 1 tab, 5 ref.

Descriptors: *Cobalt, *Iron, *Humic acids, *Fulvic acids, *Estuaries, Chelation, Organic compounds, *North Carolina.
Identifiers: *Metal-organic complexes.

Both humic and fulvic acid fractions of soil and sediment organic matter form stable water-soluble complexes and perhaps chelates with ions of Co(II) and Fe(III). The conditional stability constants (log K values) for these complexes were determined at a constant ionic strength of 1.0 in KC1. The conditional stability constants were 4.0 (pH 4.5) and 6.6 (pH 6.0) for fulvic acid-Co(II) complexes; 6.0 (pH 4.5) and 8.3 (pH 6.0) for humic acid-Co(II) complexes; 5.4 (pH 4.5) and 5.6 (pH 6.0) for fulvic acid-Fe(III) complexes; and 6.8 (pH 4.5) and 7.2 (pH 6.0) for humic acid-Fe(III) complexes. Humic acid-metal complexes may be as important as fulvic acid-metal complexes in geochemical transport of metal ions because they form water-soluble complexes with metal ions, they are more abundant in nature than fulvic acids, and they form more stable metal-organic complexes than corresponding fulvic acid-metal complexes. Fulvic acids form stable complexes with Co(II) in marine and simulated estuarine waters with conditional stability constants of 4.9 and 5.3, respectively; therefore, the formation of metal-organic complexes may be an important factor in considering natural processes in estuarine and marine environments. INTERDISCIPLINARY MODELING IN THE ANALYSIS OF THE SALINITY PROBLEMS OF THE SAFFORD VALLEY,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
A. B. Muler.
Water Resources Bulletin, Vol 10, No 2, p 245-255, April 1974. 6 fig, 9 ref.

Descriptors: *Water quality control, Saline water intrusion, *Groundwater, *Irrigation, *Economic efficiency, *Management, Water resources development, Hydrology, Rivers, Social aspects, Aquifers, Agriculture, Cotton, Alfalfa, Model studies, Systems analysis, *Arizona, *Salinity.
Identifiers: Interdisciplinary modeling, Safford Valley(Ariz).

In recent years, there have been significant declines in the quality of groundwater used for irrigation in the Safford Valley, Arizona. Reports of changes over a few weeks from freshwater to brine incited an investigation of the Valley's salinity situation. An interdisciplinary approach was chosen in which the physical, social and economic systems in the Valley were modeled in the classical methods of each field; then a composite flow relationship model was constructed to examine the interrelationship of these systems and identify multiple aspects of the salinity change in the area. The hydrologic study, salinity modeling, and economic analysis are discussed, as well as interdisciplinary implications. The composite model shows that, based on salinity trends, the Valley's principal agricultural crop--cotton--will remain economical to cultivate for a significant time beyond the model's limit of prediction. Alfalfa, however, should go out of production in large areas of the Valley by 1990 and not be under economical cultivation by 2040. The sociologic model, based on the cluster analysis of questionnaire data, shows an awareness of the salinity problems of the area but little concern over them. Interdisciplinary model-based salinity control recommendations are made. (Bell-Cornell)

NONLINEAR PROGRAMMING IN RIVER BASIN MODELING,
Calgary Univ. (Alberta). Faculty of Business.
M. B. Bayer.
Water Resources Bulletin, Vol 10, No 2, p 311-317, April 1974. 3 tab, 31 ref.

Descriptors: *Water quality control, *Model studies, *River basins, Linear programming, *Dynamic programming, Costs, Optimization, Treatment facilities, Biochemical oxygen demand, Dissolved oxygen, Standards, Streams, Systems analysis, *Oregon.
Identifiers: *Nonlinear programming, *Willamette River(Ore).

Since the real world is seldom linear, nonlinear programming is theoretically the ideal method for obtaining solutions for complex water quality problems. The use of nonlinear programming in river basin water quality modeling is explored. Ap-

plications recently reported in the literature, along with the author's experience with nonlinear programming, are reviewed. Several difficulties which still exist in applying the method are discussed. Computational results obtained using linear, dynamic, and nonlinear programming to solve a river basin water quality optimization problem are compared. Data are from Liebman's simplified version of the Willamette River system in Oregon. The water quality models have objective functions with continuous first partial derivatives, and several inequality and variable bound constraints. Results obtained are the efficiencies of treatment plants and the total cost of building or expanding the treatment plants to accommodate specified BOD loads and stream DO standards. Compared are a linear and nonlinear program of Bayer, a dynamic program of Liebman, and a linear program of ReVelle. (Bell-Cornell)

A SYSTEMS ANALYSIS OF WATER QUALITY SURVEY DESIGN,
Clemson Univ., S.C. Coll. of Engineering.
L. C. Wilcox.
Available from the National Technical Information Service as AD-768 865; $3.00 in paper copy, $1.45 in microfiche. Department of the Army Annual Report, U.S. Army Medical Research and Development Command, Washington, D.C., August 1973. 38 p, 5 fig, 1 tab, 4 appen. DADA 17-72-C-2152.

Descriptors: *Water quality, *Surveys, *Design, *Systems analysis, *Industrial wastes, *Monitoring, Pollutants, *Data collections, Simulation analysis, Sewers, Networks, Effluents, Measurement, Sites, Water sampling, Topography, Mathematical models, Resources.
Identifiers: Information management, Munitions manufacture.

In a three-year project, the design of water quality surveys is being investigated by an interdisciplinary team using systems analysis. The first year's progress in formulating and implementing models for munitions manufacturing processes, site topology, measurement resources and a resource matching program is reviewed; included also is a survey of current data handling procedures and recommendations for improvements. The surveys being studied are 15 days long and designed to characterize pollutant types and levels at the site being monitored. Resources available for data collection are limited and a 'best' sampling and analysis program must be chosen to maximize data collection. Moreover, the sites being surveyed are large and include processes with a variety of potential pollutants. Therefore, this investigation seeks to provide an information management system. Each principal process associated with munitions manufacture is modeled to provide a pollutant load as a function of production level. These process models, plus a topological model of the plant site which defines the sewer network, produce the steady-state pollutant load at each point in the sewer network and at the plant effluent points. These are combined with a model defining the United States Army Environmental Health Agency's resources available for measurement, sampling, and analysis. This gives an indication of performance and utilization of resources. Thus, the available personnel, equipment, and services available to USAEHA can be used to a maximum degree, insuring maximum useful information. (Bell-Cornell)

Descriptors: *Water quality control, *River basins, *Management, *Thermal pollution, *Organic wastes, Optimization, Biochemical oxygen demand, Dissolved oxygen, Water temperature, Standards, Dynamic programming, Mathematical modeling, Systems analysis.
Identifiers: *Nonlinear programming, Cost minimization.

Basin-wide water quality management is considered. A river system receives thermal and organic wastes, and at-source treatment is imposed. The related water quality standards are: minimum DO concentration; maximum allowable BOD concentration; maximum allowable stream temperature; and allowable rise in stream temperature. A general dynamic mathematical model representing the spatial distribution and temporal change of temperature and BOD and DO concentration is presented. Temperature effects on BOD and DO concentrations are also given. The model is highly nonlinear in nature. The optimal management problem involving the model is solved by a recently developed nonlinear programming technique, the generalized reduced gradient (GRG) method. The objective is to minimize the costs incurred when certain levels of water quality standards are to be achieved. Comparison of results obtained by the GRG method vs. dynamic programming, and of results using a more realistic mathematical model vs. a simple model is presented. The analysis procedure can be applied to designing new and examining existing water quality programs, and to study the influence of alternate policies and constraints. (Bell-Cornell)

RADIATION SAFETY PROBLEMS IN THE OPERATION OF ATOMIC ELECTRIC POWER STATIONS, (IN RUSSIAN),
I. G. Arkhangel'skaya, M. A. Baranov, N. V. Beskrestnov, M. S. Egorova, and N. G. Gusev
Gig Sanit. Vol 37, No 4, p 59-63. 1972. (English summary).
Identifiers: Atomic energy, *Electric power plants, Environmental, Operations, *Radiation safety, *USSR.

Radiation safety of both the personnel of atomic electric power stations (AEPS) and the population living in its vicinity was studied. Investigations performed at the Novovoronezhskaya and Beloyarskaya AEPS showed the yearly average irradiation level of the personnel to be within 50% of the maximal permissible doses in the USSR. The pollution levels of the environment, such as the atmosphere, plants, water, etc., serve as a radiation background and are determined by the global falls. Experience of the first 15 yr operation of AEPS in the USSR proves them to be quite safe in respect to irradiation of both the personnel of AEPS and the population of the neighboring territories. Some problems still exist in the construction of large AEPS in the vicinity or within the boundary of large towns.—Copyright 1973, Biological Abstracts, Inc.

Identifiers: Streeter-Phelps equations.

e self-purification capacity of receiving waters discharged pulp and paper mill effluents is ally evaluated with the aid of the Streeter-elps equations, based on the assumption that mineralization process is a monomolecular ction. An analysis of these equations indicates t they cannot be applied under extreme oxygen iciency, i.e., under anaerobic conditions, ause they would yield negative values for the centration of oxygen in plots of dissolved ox-n and hence of BOD changes. A modified tem of equations is presented which takes into ount the effect of oxygen concentration on the eralization process. (Stapinski-IPC)

ntifiers: Kraft mills, Howe Sound(B.C.).

od- and leaf-inhabiting marine fungi were col-ed from two depths near the effluent outlets of raft pulp mill in Howe Sound, B.C. Other sites ich were not directly affected by pulp mill ef-ents were also sampled. All groups of fungi w poorly on baits which rested on the bottom the mill. At 30 cm depth, Phycomycetes were lated as frequently from the mill as from control s. Of the Fungi imperfecti, Monodictys agica was isolated more frequently, but erion maritimum less frequently from the mill than from control sites. Phialophora fastigiata s found solely around the mill discharge site. comycetes were rarely found on panels sub-rged near the mill. Hydrographic measurements wed that the water temperature at the mill sam-site was not affected by the effluent. Salinity l pH were generally lower at the mill than at trol sites and may have been responsible in t for the observed distributional differences. itt-IPC)

A PRELIMINARY DESCRIPTION OF THE PHYSICO-CHEMICAL CHARACTERISTICS AND BIOTA OF THREE STRIP MINE LAKES, SPENCER COUNTY, INDIANA,
Saint Meinrad Coll., Ind. Dept. of Biology.
M. W. Coe, and D. V. Schmelz.
Proceedings of the Indiana Academy of Science, Vol 82, p 184-188, 1972. 4 tab, 14 ref.

Descriptors: Lakes, *Strip mine lakes, *Aquatic life, Water properties, *Water chemistry, *Lake stages, *Aquatic productivity, *Indiana, Missouri, Illinois, United States, Water quality.
Identifiers: Spencer County(Ind).

Three strip mine lakes about 30 years old in Indiana were compared for chemical, physical, and biological characteristics. One of the three was relatively fertile both in organism density and number of genera; the other two were rather sterile. Differences may be explainable by variations in area/volume ratios, basin slopes, and watersheds. The lakes resembled strip mine lakes studied in Missouri and Illinois and can be considered to be in the alkaline stage of recovery. All results reinforced the theory that each strip mine lake is modified chemically, physically, and biotically at its own rate. (Brown-IPC)

WATER POLLUTION ASPECTS OF STREET SURFACE CONTAMINANTS,
URS Research Co., San Mateo, Calif. Environmental Systems Div.
J. D. Sartor, G. B. Boyd, and F. J. Agardy.
Journal of Water Pollution Control Federation, Vol 46, No 3, p 458-467, March 1974 (Part 1). 1 fig, 7 tab, 4 ref.

Descriptors: *Urban runoff, *Water pollution sources, Water quality, Urban hydrology, Organic matter, Heavy metals, Path of pollutants, Storm water.

Materials commonly found on street surfaces contribute to urban pollution when washed into receiving waters by storm runoff. A study was performed that provides a basis for evaluating the significance of this source of water pollution relative to other pollution sources. The study was designed to include information from communities having a broad range of sizes, geographical locales, and public works practices. Information was developed for major land use areas within the cities. In general, street runoff was/a greater pollutant than sanitary wastewater, at least during storms. The major constituent of street surface contaminants is inorganic, mineral-like matter, similar to common sand and silt. The quantity of contaminant material existing at a given test site depends on the length of time elapsed since the site was last cleaned, either intentionally by sweeping or flushing or by rainfall. A great portion of the overall pollutional potential is associated with the fine solids fraction of the street surface contaminants. Current street cleaning practices are essentially for aesthetic purposes and, even under well-operated and highly efficient street sweeping programs, their efficiency in the removal of the dust and dirt fraction of street surface contaminants is low. Catch basins as they are normaliy used are reasonably effective in removing coarse inorganic solids (coarse sand and small gravel) from storm runoff, but are ineffective in removing fine solids and most organic matter. EROSIONAL LOSSES OF S-TRIAZINE HERBICIDES,
Pennsylvania State Univ., University Park. Dept. of Soil Chemistry.
J. K. Hall.
Journal of Environmental Quality, Vol 3, No 2, p 174-180, April-June 1974. 4 fig, 2 tab, 15 ref.

Descriptors: *Soil erosion, *Runoff, *Herbicides, *Path of pollutants, *Pesticide residues, Pesticides, Alfalfa, Corn(Field).
Identifiers: *Atrazine.

Erosional losses of two chloro-s-triazines, atrazine and GS13529, were evaluated in 1970 and 1971 from field runoff plots planted to corn and situated on Hagerstown silty clay loam of 14% slope. Losses of a methoxy-s-triazine, GS14254, were assayed in 1971 and 1972 from an alfalfa stand. Herbicides were applied premergent to corn and to dormant alfalfa only once during the initial growing season or initial season of evaluation of two rates, 2.2 and 4.5 kg/ha. Total losses of atrazine during the first and most critical season at the respective rates were 5.0% and 4.8% of that applied; 87% to 93% of this loss resulted within the first month following application. One month after application an average of 35.3% of the applied atrazine remained; five months later an average level of 11.8% was residual. Recovery of GS13529 ranged from 65.5% to 9.8% for the same time period. Runoff losses of GS14254 from alfalfa were inconsequential. Little runoff was obtained from this cropping system, no sediment was ever collected and runoff concentrations of the herbicide were extremely small. Total losses of this herbicide for the year were 0.02 and 0.03% for the respective application rates. (Knapp-USGS)

LAND DISPOSAL OF WASTE GASES: III. SORPTION PATTERNS FROM BURIED GAS INJECTION PIPES,
Arizona Agricultural Experiment Station, Phoenix.
S. Miyamoto, A. W. Warrick, and R. J. Prather.
Journal of Environmental Quality, Vol 3, No 2, p 161-166, April-June 1974. 7 fig, 7 ref.

Descriptors: *Soil disposal fields, *Sorption, *Gases, Air pollution, Soil chemical properties, Waste disposal, *Path of pollutants, *Pipes.
Identifiers: Gas disposal.

The advancement of sorption fronts resulting from the injection of reactive gases into soils through

buried porous pipes was analyzed mathematically and verified experimentally. The sorption front advances in ellipsoidal patterns with faster rates above the pipes in a homogeneous profile. The useful volume of soil is larger for corrugated surfaces than for plane surfaces. The corrugated surface is formed with the highest elevation directly over an injection pipe and the lowest point midway between pipes. When a shallow sorptive layer overlies a nonreactive material, the shape of the front is not circular but extends towards the midpoint between parallel pipes where the most water would infiltrate. The sorption fronts determined experimentally by injecting a dry air and nitrogen dioxide mixture into a small soil tank agreed well with the predicted positions based on an instantaneous reaction. W74-07422

RELATIVE MOVEMENT OF BROMIDE AND NITRATE THROUGH SOILS,
Agricultural Research Service, Durant, Okla. Water Quality Management Lab.
S. J. Smith, and R. J. Davis.
Journal of Environmental Quality, Vol 3, No 2, p 152-155, April-June 1974. 3 fig, 4 tab, 14 ref.

Descriptors: *Leaching, *Path of pollutants, *Nitrates, *Bromides, Biodegradation, Nutrients, Anion exchange, Soils.

Miscible displacement experiments were conducted with eight different surface soils (0-15 cm depth) and their associated subsoils (61-76 cm depth). Results indicate that the movement of bromide relative to that of nitrate is identical in subsoils but variable in surface soils. Differences in relative movement of the two anions may be attributed to microbial activity involving nitrate. With the exception of 5% anion sorption in a Greenville subsoil, anion exclusion values ranged from 5% to 39%, indicating the anions were moving 1.05 to 1.64 times as fast as they would if they had been uniformly associated with all the soil water. The results support the view that bromide has utility for following the potential path of nitrate movement through soils. (Knapp-USGS)
W74-07423

VOLATILITY OF DDT RESIDUES IN SOIL AS AFFECTED BY FLOODING AND ORGANIC MATTER APPLICATIONS,
Agricultural Research Service, Riverside, Calif. Soil and Water Conservation Research Div.
W. F. Spencer, M. M. Cliath, W. J. Farmer, and R. A. Shepherd.
Journal of Environmental Quality, Vol 3, No 2, p 126-129, April-June 1974. 4 tab, 22 ref.

Descriptors: *DDT, *Degradation(Decomposition), *Flooding, *Organic matter, *Pesticide removal, Pesticide residues, Soil chemistry, DDE, DDD, Water pollution control, *California.
Identifiers: Coachella Valley(Calif).

Flooding with and without organic matter additions was evaluated as a means of preferentially degrading residual DDT and thereby changing the ratio of the various isomers and metabolites volatilizing from the soil surface. Flooding for a 7-week period, either with or without manure or alfalfa meal applications, effectively degraded DDT isomers, primarily to the respective DDD isomers, but had little effect on DDE isomers. Both flooding and organic matter decreased the volatility even when soil concentrations were not affected, apparently because of increased adsorption of the compounds by added organic matter or by organic matter in the soil altered by flooding. Minor changes in vapor concentration ratios were accomplished by flooding and organic matter additions, but regardless of treatment, the major constituent evaporating from the surface was DDE. To accomplish significant changes in volatilization patterns, it will be necessary to use such management practices before a major part of the DDT has been degraded to DDE. However, flooding and organic matter treatments will ultimately decrease the total quantity of DDE volatilizing from residual DDT in soils over long time periods because of their effectiveness in degrading DDT to DDD instead of DDE. (Knapp-USGS)
W74-07424

METHYLMERCURY FORMATION IN MERCURY-TREATED RIVER SEDIMENTS DURING IN SITU EQUILIBRATION,
Wisconsin Univ., Madison. Dept. of Soil Science.
L. W. Jacobs, and D. R. Keeney.
Journal of Environmental Quality, Vol 3, No 2, p 121-126, April-June 1974. 2 fig, 4 tab, 26 ref.

Descriptors: *Mercury, *Bottom sediments, Rivers, *Wisconsin, Heavy metals, Poisons, Path of pollutants, Translocation, Bed load, Sediment transport.
Identifiers: *Methyl mercury, Wisconsin River, Fox River(Wis).

Methylmercury (MeHg) production in and Hg loss from sediments treated with mercuric chloride (HgC12) or phenylmercuric acetate (PhHgAc) were studied in two environmentally different river sites (one each on the Wisconsin and Fox rivers). Bulk sediment was collected from each river site, treated with approximately 1, 10, or 100 ppm Hg (oven-dry basis) as HgC12 or PhHgAc, and returned to the river site with untreated controls for 2, 4, or 12 weeks of equilibration with the aquatic environment. After retrieval, the sediments were analyzed for total Hg. Hg losses from stationary sediments were minimal and sediment transport is probably the major source of Hg movement in a river system. In both sediments, more MeHg was produced from PhHgAc than from a similar concentration of HgC12, and MeHg concentration increased as the Hg treatment with either compound was increased. The MeHg concentration increased as the Hg treatment with either compound was increased. The MeHg concentrations found in the Wisconsin River sediments were substantially higher than in the Fox River sediments with a similar Hg treatment. The large differences in MeHg production between these two sediments may be partially attributed to their chemical dissimilarities. The Wisconsin River sediment is acidic and contains more organic materials compared to the Fox River sediment which is more alkaline and contains larger amounts of sulfide sulfur. (Knapp-USGS)

LOSSES OF INORGANIC NITROGEN FROM AQUATIC SYSTEMS,
New York State Coll. of Agriculture and Life Sciences, Ithaca. Dept. of Agronomy.
D. R. Bouldin, R. L. Johnson, C. Burda, and C--W. Kao.
Journal of Environmental Quality, Vol 3, No 2, p 107-113, April-June 1974. 1 fig, 11 tab, 15 ref.

Descriptors: *Nitrogen, *Ponds, *Denitrification, *Ammonia, Sediments, Evaporation, Nitrates, Nitrogen cycle, *New York, Nitrogen compounds.

Loss of NH4 and NO3 from solution was followed over a 2-month period in 6 ponds with the objective of investigating the mechanisms and magnitude of losses of inorganic nitrogen. Biological immobilization of nitrogen was small in relation to the total amount added. Losses of NH4 ranged from 2% to 38% per day. A model based on concentration of ammonium N and water pH was consistent with the experimental data, and the results were in agreement with the hypothesis that the major avenue of NH4 loss was by NH3 volatilization across the air-water interface. Nitrate losses ranged from 7% to 15% per day. The results were consistent with the hypothesis that nitrate loss was primarily by denitrification in the bottom sediments. Models for loss of both ions were derived. The models are based on general chemical and physical parameters which are not peculiar to the ponds studied (that is, depth of water, water pH, and a reduced zone of sediments underlying a thin oxidized layer of sediment). The results suggest that volatilization and denitrification are mechanisms which may account for appreciable losses of N from many bodies of water. (Knapp-USGS)

Descriptors: *Path of pollutants, *Pesticides, *Runoff, *Mathematical models, Model studies, Rainfall-runoff relationships, Translocation, Erosion, Pesticide kinetics.
Identifiers: Pesticide runoff.

A mathematical model of the dynamic, single-rainfall-event type describes pesticide runoff as a function of pesticide and soil properties, agricultural practices, watershed characteristics, and climatic factors. The conceptual structure of the model includes source term effects, loss of pesticide from the soil surface during runoff producing rainfall events because of mass transfer from soil surface into the moving runoff film and pickup of sediment containing pesticide particulates. DISPERSION OF CONTAMINATED SEDIMENT BED LOAD,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
H. W. Shen, and H. F. Cheong.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY11, p 1947-1965, November, 1973. 15 fig, 2 tab, 6 ref.

Descriptors: *Bed load, *Dispersion, *Erosion, *Sedimentation, Hydraulics, Water pollution sources, Radioactivity, Sediment transport, *Path of pollutants.

Dispersion of instantaneously released contaminated bed sediments is analyzed within the framework of a Lagrangian probabilistic model. The time and space concentration distributions, with the parameters computed on the basis of the same rate of mass movement and a constant rate of spread, approach Gaussian form asymptotically. A procedure is suggested for deriving approximations to the envelopes of the distribution curves parameterized by either the time or distance. The method is also applicable when the shape factor of the particle step length distribution takes on nonintegral values greater than one. Where the normality approximation is satisfactory, the critical duration for a given degree of pollution varies in direct proportion to the square root of the distance from the source. Graphical results for the critical time limits for the absorption of radiation from contaminated particles for different positions of the subject are also presented. (Skogerboe-Colorado State)

escriptors: *Sulfates, *Sulfur, Sulfur compunds, *Gypsum, Inorganic compounds, Leaching, Water pollution sources.

terest has developed in the use of elemental sulr as a means of maintaining an adequate supply sulfur where leaching is a problem. Studies ere conducted with gypsum, finely divided elental sulfur, and prilled sulfur on a Wagram amy sand and a Georgeville silty clay loam to termine the levels of sulfate sulfur resulting om additions of these sources. Sulfate contents the 0 to 15-, 15 to 30- and 30 to 45-cm depths ere determined at various times over aperiod of 0 days after the different sulfur sources were aped in October. Almost all of the sulfate, that ded sypsum and that resulting from the oxidan of elemental sulfur, had been leached from e top 45 cm of the Wagram soil 180 days after apcation. There was essentially no movement of lfate, however, in the Georgeville soil. Very litoxidation of prilled sulfur appeared to be occurg in either soil. (Skogerboe-Colorado State)

ntifiers: Federal Water Pollution Control Act.

at discharges from electric generating plants, th fossil-fueled and nuclear, have become own as thermal pollution because of their tenncy to adversely affect aquatic ecology. Courts plying common law doctrines have universally emed such discharges to be pollution. A subntial number of state pollution statutes include at in the definition of pollution, and the Federal ater Pollution Control Act amendments will quire each state to establish thermal pollution ndards. A recent case defined refuse as including thermal discharges, thereby allowing enforcement against such discharges under the Rivers and Harbors Act. Control in the future over thermal discharges will be accomplished through licensing requirements at both the state and federal level. In addition, comprehensive power plant siting legislation can force pre-selection planning to avert or minimize harm from waste heat discharges. Another method of preventing thermal heat from becoming thermal pollution is to incorporate beneficial uses of the discharge into the powerplant's operation. The potential beneficial use of thermal discharges is limited only by technological imagination. Florida's Aquaculture Law is an example of a legal framework for encouraging this type of development, providing authority to lease submerged lands for aquaculture purposes. (Ritchie-Florida)

A STUDY OF THE MOVEMENT OF PHOSPHOROUS IN THE LITTLE RIVER ESTUARY, N.S.W.,
Australian Atomic Energy Commission Research Establishment, Lucas Heights.
M. S. Giles.
Report AAEC/TM-616, October 1972. 22 p, 7 fig, 2 tab, 16 ref.

Descriptors: *Absorption, *Radioisotopes, *Phosphorus, *Estuaries, Phytoplankton, Chlorophyll, Zooplankton, Dissolved oxygen, Nuclear wastes, Movement, Tritium, Tracers, Food chains, Metabolism, Photosynthesis, *Australia.
Identifiers: Little River(N.S.W.), Phosphorus-32.

Knowledge of the physical and biological modes of dispersion of radioactivity and of how released radioactivity can progress through food chains, sometimes with a concentration factor, is necessary in order to determine the rates at which the various steps in this cycle occur so that dispersion or concentration may be predicted. The estuary of the Little River, N.S.W. was mapped and measurements made of phytoplankton productivity, phosphorus content, chlorophyll-a content, zooplankton biomass, salinity, temperature, and oxygen content. Phosphorus-32 and hydrogen 3 were injected into the estuary and the rate of phosphorus-32 movement into the phytoplankton and zooplankton calculated. Soluble P-32 in the estuary moved rapidly into the phytoplankton with a turnover time of about two hours. Phosphorus-32 incorporated into the phytoplankton was found to be dispersed and diluted in the same way as tritiated water released at the same time. Movement of P-32 into the zooplankton was much slower. During a tidal phase of the estuary, P-32 taken up by the phytoplankton (comprising at least 90% of the total isotope released) was flushed from the system. During the same phase P-32 in the zooplankton was retained in the estuary. (Jones-Wisconsin)

GROUND-WATER FLOW PATTERNS IN CONFINED AQUIFERS AND POLLUTION,
Iowa State Water Resources Research Inst., Ames.
D. Kirkham, and R. R. Van der Ploeg.
Journal of the American Water Works Association, Vol 66, No 3, p 192-197, March 1974. 9 fig, 13 ref. OWRR B-019-IA(6).

Descriptors: *Flow nets, *Artesian aquifers, *Groundwater movement, *Path of pollutants, Aquifers, Aquifer characteristics, Hydrogeology, Steady flow.
Identifiers: Confined aquifers.

A flow net may be made for an arbitrarily shaped, confined aquifer from which water is drawn by means of a well. A knowledge of the shape of the aquifer and the hydraulic head on the boundaries of the aquifer, which are not impervious, is required. Flow nets for a number of elliptical-shaped confined aquifers, by which naturally occurring aquifers may be approximated, are presented. At points in the aquifer where the velocities are low (streamlines far apart), a source of pollution will not be as dangerous as an equal source placed at a location in the pumped aquifer where the velocities are high (streamlines close together). The theory is valid for any shape of aquifer and any diameter of well for any location of the well in the aquifer. The steady-state results indicate approximately what happens under non-steady-state conditions. (Knapp-USGS)

Descriptors: *Thermal pollution, *Ice cover, *Rivers, *Melting, Thermal powerplants, Mixing, Water temperature, Heated water, Path of pollutants, Dispersion.
Identifiers: Ice prevention, Ice control.

The increase in water temperature in natural streams due to waste heat disposal from thermal powerplants leads to extensive ice-free reaches during winter periods. The surface heat exchange between water and the atmosphere can be expressed, for most practical purposes, as a linear function of the water temperature. Using this approximation, a closed-form solution of the one-dimensional unsteady convection-diffusion equation was developed to predict temperature distributions in streams and the lengths of ice-free reaches downstream from the thermal discharge sections. Descriptors: *Water quality, *Sediment yield, *Soil conservation, Land management, *Iowa, Pesticides, Contour farming, Terracing, Farm management.

To evaluate the influence of the level-terrace conservation practice on water, sediment, and plant nutrients discharged in surface runoff and base flow, data obtained from this watershed were compared with data obtained from a 33.6-ha contour-planted corn-cropped watershed near Treynor, Iowa. The quality of water discharged from the 157.5-ha diversified conservation-farmed watershed in southwestern Iowa was within acceptable limits for potable water except for the levels of ammonia, inorganic phosphorus, and coliform. Total coliform levels exceeded the established criteria on two occasions, and fecal coliform once during the 2-year study. Nutrient concentration was high occasionally, but the nutrient quantities discharged from the watershed were low, showing the effectiveness of the level-terrace system in controlling surface runoff and erosion. Atrazine residue in the runoff and sediment was detected in only one sample. Even though several chlorinated hydrocarbon and organophosphate compounds had been applied to the watershed, none was detected in runoff or sediment. A comparison of the data from the 33.6-ha contour-farmed watershed with the data from the 157.5-ha well-planned conservation watershed showed the benefits and necessity of controlling runoff and erosion to prevent loss of agricultural chemicals. DISTRIBUTION AND CHEMISTRY OF PHOSPHORUS IN AN ALBAQUALF SOIL AFTER 82 YEARS OF PHOSPHATE FERTILIZATION,
Missouri Agricultural Experiment Station, Columbia.
C. W. Kao, and R. W. Blanchar.
Journal of Environmental Quality Vol 2, No 2, p 237-240, April-June 1973. 2 fig, 3 tab, 25 ref. OWRR A-031-MO(3) 14-31-0001-3225.

Descriptors: *Phosphates, Phosphorus, *Phosphorus compounds, Groundwater, Water pollution sources, *Distribution, *Path of pollutants, Soils, Loan.
Identifiers: *Albaqualf soils).

The distribution of P in a fertilized and unfertilized Mexico silt loam soil was measured. After 82 years of P fertilization, the added P was found in Ap (0-23 cm), smaller amounts in the A and B, and B2 (23-86 cm), and large amounts in the B3 and upper C (86-137 cm) horizons. In the fertilized soil the distribution of P, particularly inorganic and available, was similar to that of original P in the soil profile. The P adsorption capacities of fertilized and unfertilized soils were similar. These data indicated that the soil fertilized with P for 82 years had nearly double the total P content, but the ability of the soil to adsorb additional P was the same. Ion products indicated that the P level in the soil solution was controlled by the solubility of strengite.

REACTIONS OF CHLORAMINES WITH ACTIVE CARBON,
Greeley and Hansen, Chicago, Ill.
R. C. Bauer, and V. L. Snoeyink.
Journal Water Pollution Control Federation, Vol 45, No 11, p 2290-2301, November 1973. 8 fig, 12 ref.

Descriptors: *Chemical reactions, *Activated carbon, *Nutrient removal, Ammonia, Nitrogen compounds, Chlorination, Chlorine, Hydrogen ion concentration.
Identifiers: *Chloramines, Monochloramine, Dichloramine, Chlorine residual, Trichloramine.

The purpose of this study was to determine the nature of the NH2Cl-active carbon and NHC12-active carbon reactions. These reactions are of importance if carbon is to be used to eliminate combined residual chloride from an effluent and if it is to aid in the oxidation of NH3-N to N2. The tests were performed in small-scale batch systems with pH control being used to maintain either NH2Cl or NHC12 as the predominant species in the C1-NH3 solution. NHC12-N is readily oxidized by carbon to N2. NH2C1-N is reconverted to ammonia by fresh carbon; however, carbon that has an accumulation of surface oxides, which develop through reaction of free and combined chlorine with carbon, will partially oxidize NH2C1-N to N2. Identifiers: *Zectran, *Photodecompositio *Photoproducts, *Fate of pollutan Photochemistry, Infrared spectra, NMR spect Mass spectra, Degradation products, Thin lay chromatography, 4-Dimethylamino-3 5-dimeth phenol, 4-Hydroxy-2 6-dimethyl-N-methyl benz mide, 4-Monomethylamino-3 5-xylyl-N-meth carbamate, Infrared spectrophotometry, Samp preparation.

The photodecomposition of 4-dimethylamino-3, xylyl-N-methyl carbamate (Zectran) in aerat and degassed solution has been carried out. Thr major photoproducts were detected and chara terized to be: 4-dimethylamino-3,5-dimeth phenol, 4-hydroxy-2,6-dimethyl-N-methyl benz mide and 4-monomethylamino-3,5-xylyl-N-meth carbamate. The phenol and benzamide produc suggest that one of the pathways of photodecor position of Zectran is via a photo-Fries rearrang ment. The ortho-benzamide (5-dimehylamino-4, dimethyl-2-hydroxy-N-methyl benzamide) whi could also be expected to occur in a photo-Fri reaction, was not observed. The excitatio wavelength was greater than 296.7 nm, i.e. radi tion available in the solar spectrum. Thus t products observed in this study may be expecte to occur in the environment as a result of the a tion of sunlight on Zectran. (Holoman-Battelle)

Environmental Science and Technology, Vol No 10, p 945-948, October 1973. 8 fig, 6 ref.

Descriptors: *Oily water, *Separation technique Dispersion, Surfactants, Stabilization, Emulsions Analytical techniques, Turbidity, Oil, Distribu tion, Photography, Microscopy.
Identifiers: *Light transmittance, *Microscopi photography, Ballast water, Droplet size, Crud oil, Bunker C oil.

aightforward techniques to determine the state dispersion - i.e., quantity and droplet size distution - for oily ballast waters are outlined. Oil ncentrations were determined by using light nsmittance through an ultrasonically emulsed, surfactant-stabilized sample, while oil plet size distributions were directly measured ng a microscopic photography cell. When these hniques were applied to actual deballasting erations, it was confirmed that oily ballast rifiers for crude oil tankage must be able to han- oil fines that are as small as microns in diame- along with very high levels of oil contamination ich may exceed 10 percent on occasion. The centration of crude and Bunker 'C' oil (10-5000 n) in distilled water samples was reproducibly asured on a turbidity meter. The instrument sisted of a light source, sample holder cell, an asonic emulsifier, and a photocell. Transmitted t was used to make the measurement. Since put was sensitive to the oil type, calibration ves have been obtained with standards duced from Kuwait, and Venezuela crudes and nker 'C'. The droplet size distribution apatus consists of a small transparent flow cell in. wide by 3/8 in. mounted on a microscope form. Photographs are taken of the sample am while it flows through the cell. The optical tem consists of a direct light source nsmitted through the sample cell), microscope rel and reflex camera. The microscope and light rce have been mounted to a shock-insulated form to facilitate field use. (Mortland-Battelle)

VITRO FORMATION OF NITRATE REDUCSE USING EXTRACTS OF THE NITRATE DUCTASE MUTANT OF NEUROSPORA ASSA, NIT-1, AND RHODOSPIRILLUM BRUM,
kland Univ., Rochester, Mich. Dept. of Biologi- Sciences.
A. Ketchum, and C. L. Sevilla.
rnal of Bacteriology, Vol 116, No 2, p 600-609, vember 1973. 6 fig, 3 tab, 25 ref.

scriptors: *Laboratory tests, Biochemistry, ay, Nitrates, Molybdenum, Hydrogen ion contration, Fungi, Bacteria.
ntifiers: *Nitrate reductase, *Biosynthesis, ell extracts, *In vitro synthesis, Neurospora ssa, Rhodospirillum rubrum, Subcellular coments, Enzyme activity, NADPH-nitrate reduce, FADH2-nitrate reductase, MVH-nitrate uctase, Mutants, Sample preparation, Bacterial siology.

vitro formation of reduced nicotinamide nine dinucleotide phosphate (NADPH)-nitrate uctase (NADPH: nitrate oxido-reductase, EC 6.2) has been attained by using extracts of the ate reductase mutant of Neurospora crassa, 1, and extracts of either photosynthetically or erotrophically grown Rhodospirillum rubrum, ich contribute the constitutive component. The vitro formation of NADPH-nitrate reductase is racterized by conversion of the flavin adenine ucleotide (FAD) stimulated NADPHochrome c reductase, contributed by the N. ssa nit-1 extract from a slower sedimenting m (4.5S) to a faster sedimenting form (7.8S). e 7.8S NADPH-cytochrome c reductase peak ncides in sucrose density gradient profiles with NADPH-nitrate reductase, FADH2-nitrate uctase and reduced methyl viologen (MVH)ate reductase activities which are also formed vitro. The constitutive component from R. rum is soluble (both in heterotrophically and otosynthetically grown cells), is stimulated by the addition of 0.0001 M Na2MoO4 and 0.01 M NaNO3 to cell-free preparations, and has variable activity over the pH range from 3.0 to 9.5. The activity of the constitutive component in some extracts showed a threefold stimulation when the pH was lowered from 6.5 to 4.0. The constitutive activity appears to be associated with a large molecular weight component which sediments as a single peak in sucrose density gradients. However, the constitutive component from R. rubrum is dialyzable and is insensitive to trypsin and protease. These results demonstrate that R. rubrum contains the constitutive component and suggests that it is a low molecular weight, trypsin- and protease-insensitive factor which participates in the in vitro formation of NADPH nitrate reductase. DISTRIBUTION AND STANDING CROPS OF CHIRONOMID-LARVAE IN SHIOZU BAY OF LAKE BIWA (IN JAPANESE),
M. Hiro, and M. Sato.
Jap J Limnol, Vol 33, No 2, p 21-28, 1972, Illus, English summary.
Identifiers: Bays, *Chironomid larvae, Chironomus-plumosus, Distribution, *Japan(Lake Biwa), Phaenopsectra, *Standing crops.

The distribution pattern and the standing crops of chironomid-larvae were investigated at Shiozu Bay of Lake Biwa (Japan). The bottom was sampled 4 times through the year; April, Aug., Oct., 1968 and Jan., 1969. Phaenopsectra sp. B, Phaenopsectra sp. C, Procladius sp. B and so on were dominant species next to Chironomus plumosus. Most species lived in the mud, some of them in gravel, and are distributed on bottoms shallower than 30 m. None were found on the sand bottom. Phaenopsectra sp. B is very widely distributed from the lake-side to a depth of about 60 m. The number of investigations for sampling by a bottom sampler are 2.3-3.8 times for C. plumosus and 46.2-66.3 times for Phaenopsectra sp. C, in 50% confidence limits, respectively. C. plumosus was dissected for the examination of food habit. In the 5 examples, some algae were recognized in the alimentary canal.--Copyright 1973, Biological Abstracts, Inc.

LAUNDRY DETERGENTS AND ENVIRONMENTAL QUALITY,
Indiana Univ., Bloomington. Poplars Research and Conference Center.
R. S. Howe, J. G. Morris, and H. W. Poston.
Occasional Papers No 2, May 1973. 25 p, 8 fig, 9 tab, 15 ref.

Descriptors: *Detergents, *Phosphates, *Sewage treatment, *Laundering, Formulation, Safety, Effluents, Illinois, Standards, Legislation, Prices, Capital costs, Operating costs, Judicial decisions.
Identifiers: *Chicago(Ill), Nonphosphate detergents, Cleaning ability, Phosphorus removal costs.

The laundering effectiveness, public hazards, and costs between a public policy requiring a laundry product reformulation and treatment measures to reduce phosphates discharged into the environment are compared. Detergents having different phosphate levels are evaluated with respect to safety, cleaning ability, and effect on phosphate effluent level. Reports, including those of the Chicago Board of Health and the Food and Drug Administration, indicate that no additional health hazards are created by use of non-phosphate detergents. Similarly, comparison of alternative detergent formulations reveal comparable soil removal abilities. Chicago consumers' response to the nonphosphate detergents provides another indicator of acceptable performance. Surveys in other jurisdictions having legislated against detergents having high phosphate levels indicate favorable responses. Examination of effluent data in these areas also indicates improvements in water quality. In Erie County, New York, for example, a reduction of phosphate contents to zero percent between 1970 and 1972 has resulted in total phosphate and biochemical oxygen demand reductions of 44 and 48% respectively. Evaluation of consumer price fluctuations indicates no significant relationship with policy change. Overall, product reformulation appears to have lower direct cost in compliance with effluent standards requiring phosphorus concentrations of less than 1.0 mg/l. (Schroeder-Wisconsin)

BIOCHEMISTRY OF SELECTIVE TOXICITY AND BIODEGRADABILITY: COMPARATIVE O-DEALKYLATION BY AQUATIC ORGANISMS,
Illinois Univ., Urbana. Dept. of Entomology.
L. G. Hansen, I. P. Kapoor, and R. L. Metcalf.
Comp Gen Pharmacol Vol 3, No 11, p 339-344. 1972.
Identifiers: Aquatic animals, Biochemistry, DDT, *Dealkylation, Degradability, *Gambusia-Affinis, Larvae, Minnow, Mosquito, Snails, *Toxicity, *Biodegradation.

Female Gambusia affinis have a greater capacity for O-dealkylation of p-nitrophenyl ethers and DDT analogues and the formation of acid-labile conjugates than do mosquito larvae, fat-head minnows, or 2 species of pulmonate snails. The p-nitrophenyl ethers are O-de-ethylated most readily by all species, while the DDT analogues are O-demethylated most readily. Fish absorb the greatest amount of insecticide in a 24 hr period; the excretion rate is highest in Gambusia and lowest in the minnow. The toxicity of DDT analogues correlates with metabolism data, except in snails, which are naturally tolerant to chlorinated hydrocarbons.--Copyright 1973, Biological Abstracts, Inc.

THE PREDICTED INFLUENCE OF KRAFT MILL EFFLUENT ON THE FISHERY RESOURCES,
Oregon State Univ., Corvallis. Sea Grant Marine Advisory Program.
H. F. Horton, and L. P. Parrish.
In: Multi-disciplinary Study of Water Quality Relationships. A Case Study of Yaquina Bay, Oregon, Oregon Agricultural Experiment Station, Special Report 348, February 1972. p 33-64, 3 fig, 11 tab. WP-00107.

Descriptors: *Estuarine fisheries, *Water pollution effects, *Economic impact, Sport fishing, Recreation, Pulp wastes, Lethal limit.
Identifiers: *Yaquina Bay(Ore.).

Biological losses to recreational fishing caused by kraft mill effluent (KME) were examined for Yaquina Bay, Oregon. An angler survey conducted to determine principal sports fishes and invertebrates and their distribution in the bay found white seaperch to be the most important of the total estimated catch, followed by starry flounder and pile seaperch. Bioassays were conducted to determine the 48 and 96-hour median tolerance limit value of KME for each species. The maximum allowable KME for each species tested, computed with an application factor of 1/10 of the 48-hr median TL was: white seaperch 1.7%, striped seaperch 1.7%, starry flounder 2.5%, English sole 1.9% and kelp greenling 3.1%. Using each of these test elements and an earlier prediction of KME concentration the impact of several alternative waste disposal methods and sites on the fishing resource was estimated. Additional data is necessary to better apply bioassay results to various water quality situations which should include better knowledge of the avoidance reaction of estuarine fish to various dilutions of KME. Tests must also be comducted on the impact of KME on the food chain and on the taste of fish. (See also W74-07142) (Schroeder- Wisconsin)

EFFECTS OF MAN-MADE WORKS ON THE HYDRAULIC, SALINITY, AND SHOALING REGIMENS OF ESTUARIES,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Div.
H. B. Simmons, and F. A. Herrmann, Jr.
In: Environmental Framework of Coastal Plain Estuaries; 18th Annual Meeting of Southeastern Section of the Geological Society of America, April 10-11, 1969, Columbia, S C: Geological Society of America, Inc, Memoir 133, p 555-570, 1972. 15 ref.

Descriptors: *Estuaries, *Water circulation, *Sedimentation, *Water control, *Environmental effects, Dams, Dredging, River training, Flood control, Levees, Reservoir operation, *Salinity, Streamflow, *Southeast U.S.
Identifiers: Shoaling regimens.

Within the relatively recent past, many works of man have been constructed in estuaries and in their freshwater tributaries in the interest of improving navigating conditions, or regulating the river flow for hydroelectric power generation and flood control. In some cases such works have produced major and sometimes undesirable changes in the hydraulic, salinity, and shoaling characteristics of the estuaries involved. The undesirable effects have in some cases been so drastic that the overall effects may have been detrimental rather than beneficial. The works of man have influenced the hydraulic, salinity, and shoaling regimens in the passes of the Mississippi River, the lower Savannah River, and Charleston Harbor. The histories of these changes strongly recommend that any proposed changes should be thoroughly evaluated by all practicable means before their implementation to insure that the proposal will be beneficial to the system as a whole. Available from the National Technical Information Service as PB-231 767 $4.00 in paper copy, $1.45 in microfiche. Completion Report, February 1974, 91p, 44 tab. OWRR B-027-VA (1).

Descriptors: *Nitrogen *Phosphorus, *Carbon, Detritus, Budgeting, *Salt marshes, Waterquality, *Eutrophication, *Virginia, Estuaries, Tidal effects, Path of pollutants.
Identifiers: Ware Creek(Va), Carter Creek(Va).

Annual nitrogen, phosphorus and carbon budgets for two Virginia salt marshes were determined by monthly measurements of water discharge and constituent concentrations over tidal cycles. Considering all three forms of phosphorus measured (total, dissolved organic and orthophosphate) there was a net loss from the estuary to the marshes. The data reveal a loss of particulate phosphorus of estuarine origin to marsh sediments and mineralization of this phosphorus in the marshes with subsequent export of dissolved inorganic and organic phosphorus back to the estuary. Nitrogen flux data show a loss of nitrate and nitrite to the marshes. Particulate nitrogen is imported to the marshes where it is mineralized and returned to the estuary as ammonia and dissolved organic nitrogen. The magnitude of nitrogen export suggests significant fixation of atmospheric nitrogen by marsh flora with subsequent export as dissolved species. Carbon flux data show significant contributions of both particulate and dissolved organic carbon to the estuary from the marshes. Estimates of export, based on marsh grass productivity, suggest a loss of 36 and 49% of a years primary production on the marshes as detritus for Ware and Carter Creeks respectively.

Descriptors: *Standing crops, *Biological communities, *Primary productivity, *Nutrients removal, Periphyton, *Eutrophication, *Tertiary Treatment, Simulation analysis, Biomass, Chlorophyll, Nitrogen phosphorus, Carbon, Waste water treatment, Filtration, Coagulation, Activated carbon, Absorption, *Simulation analysis, Water pollution effects.
Identifiers: Systems Simulation, Laboratory models(Streams).

Accelerated eutrophication caused by man continues to be a major water pollution problem. A controllable laboratory system has been designed, composed of several model streams established under comparable environmental conditions. The streams were used in studying the effects, during six experiments, of various conventional tertiary nutrient removal schemes upon the standing crop biomass, phytopigments, primary productivity and community structure, of autotrophic periphyton communities. Ferric chloride coagulation-precipitation, breakpoint chlorination, and activated carbon absorption with dual media filtration was used for removal of phosphorus, nitrogen, and carbon respectively. All types of tertiary treatment methods studied resulted in varying increases in the above biological parameters. Single nutrient removal methods caused greater increases than double or triple nutrients removal methods. These results indicate that using accepted methods for nutrient removal may not prevent algal productivity resulting in more rapid eutrophication.

EXTRACELLULAR PRODUCTS OF ALGAE IN FRESHWATER,
University Coll. of North Wales, Menai Bridge. Marine Science Labs.
G. E. Fogg.
Ergeb Limnol. 5. p 1-25. 1971.
Identifiers: *Algae, Amino acids, Carbohydrates, Enzymes, Extracellular products, Glycolic acid, Growth, Light, Oligotrophic conditions, *Organic compounds, Peptides, Phosphates, Photosynthesis, Saccharides, Sexual, Toxins, Vitamins, *Reviews, *Carbon compounds.

A review of the available information suggests that the liberation from healthy algal cells of organic substances in soluble form is a general phenomenon. Especially under oligotrophic and light-inhibited conditions a substantial proportion of the C fixed in photosynthesis is liberated extracellularly as glycollic acid or polysaccharides and these probably form an important energy source for other aquatic organisms. Other substances excreted include carbohydrates, amino acids, peptides, organic phosphates, volatile substances, enzymes, vitamins and other growth promoting substances, sexual substances, inhibitors and toxins, many of which may exert important effects in natural ecosystems.--Copyright 1973, Biological Abstracts, Inc.

ONOMIC DAMAGES FROM RESIDENTIAL E OF MINERALIZED WATER SUPPLY,
vironmental Protection Agency, Washington, C. Economic Analysis Div.
P. Tihansky.
ter Resources Research, Vol 10, No 2, p 145- , April 1974. 8 fig, 5 tab, 38 ref.

scriptors: *Water quality, *Domestic water, amages, Public health, Scaling, Corrosion, onomics, Abrasion, *Costs, Plumbing, mputer programs, Clogging.

usehold appliances and personal items in con- t with water supplied municipally or from vate sources are subject to physical damages m chemical and other constituents of the water. onomic losses are calculated for a typical sehold and aggregated to the national and in- idual state levels. The types of physical nages expected and the associated water quali- determinants were identified, and the physical ects were then translated into economic losses. mage functions were formulated to predict like- impacts of water quality changes on each sehold unit affected. A computer program ed on these functions was designed to estimate al damages per typical household and to ag- gate them over selected regions. The program s applied to state-bystate data describing water ply sources and socioeconomic parameters. al annual damages to U.S. residents in 1970 re estimated to be in the range $0.65-$3.45 bil- , the mean being $1.75 billion. The mean trans- es to $8.60 per person annually. States having highest total damages were California ($230 lion) and Illinois ($164 million). On a per capita is, Arizona ($22.53) and New Mexico ($18.58) ked highest, whereas South Carolina ($1.15) Oregon ($1.73) were at the other end of the ctrum. When per capita damages were com- ed by source of water supply, private wells re highest at an average of $12.34, treated undwater was next at $11.20, and treated sur- e water was last at $5.83. LCANIC AIR POLLUTION: DELETERIOUS FECTS ON TOMATOES,
waii Agricultural Experiment Station, Honolu-

A. Kratky, E. T. Fukunaga, J. W. Hylin, and R. Nakano.
Journal of Environmental Quality, Vol 3, No 2, p 138-140, April-June 1974. 2 fig, 3 tab, 6 ref.

Descriptors: *Air pollution, Volcanoes, *Hawaii, *Air pollution effects, *Tomatoes, Hydrogen ion concentration, Chlorides, Sulfates, Rainfall, Morbidity, Phytotoxicity.
Identifiers: *Volcanic air pollution.

From the winter of 1969-70 to the summer of 1973, severe yield and quality reductions related to volcano eruptions occurred on field grown tomatoes in the Kona district on the Island of Hawaii. Symptoms included blossom drop, poor fruit set, hollow, small, and almost seedless fruits, and a less luxuriant appearance. A definite atmospheric haze was caused by fumes from active and degassing vents located 75 km away and associated with Kilauea Volcano. Tomato plants under plastic rainshelters grew normally. Rainwater was acidic (pH 4.0) and contained appreciable quantities of Cl and SO4 plus 27 detectable organic compounds. When tomato leaf discs were immersed in rainwater samples, more Ca, Mg, and K were leached from these acidic samples then from less acidic rainwater samples and the distilled water controls. In a pollen germination medium containing rainwater, pollen germination and tube lenghts decreased as the pH of the rainwater decreased. The rainwater samples from a single heavy rainfall were less acidic than from cumulative samples of lighter rainfalls. (Knapp-USGS)

NUTRIENT CYCLING AND PRODUCTIVITY OF DYSTROPHIC LAKE-BOG SYSTEMS (PART B),
Notre Dame Univ., Ind. Dept. of Biology.
R. W. Greene.
Available from the National Technical Information Service as COO-1770-4; $5.25 in paper copy, $1.45 in microfiche. Report COO-1770-4, March 1973. 62 p, 2 fig, 24 tab, 39 ref. AEC AT (11-1)-1770.

Descriptors: *Cycling nutrients, *Productivity, *Dystrophy, *Bogs, Baseline studies, Phosphorus, Cations, Ions, Metabolism, Calcium, Lime, Iron, Organic matter, Predation, Midges, Zooplankton, Mosses, Food webs, Alkalinity, *Indiana.
Identifiers: *Lake-bog systems, Chaoborus americanus, Sphagnum.

Baseline data were collected on several different bog-lakes. Total phosphate determinations were done on material trapped in the sediment collectors placed throughout the water column. It was suggested that if the bog lakes were permanently meromictic, then perhaps all vertical transport (especially through the monimolimnion) is by biological transport. In general, alkalinity is increased throughout the water column following liming, and slowly drops back to normal values in a matter of weeks. To gain some insight into iron cycling and abundance at various depths, total iron analyses were done on material caught in sediment traps throughout the water column. It was found that both calcium and iron were bound to the large-molecule organic fraction, but differed in extent. The predatory potential of the Chaoborus populations is a function of two behavioral responses: the functional response of individual predators and the numerical response of the predator populations. Any input of alkaline earth cations into one bog studied will rapidly be sequestered by Sphagnum of the bog mat. As a result the main cause of increased productivity due to artificial alkalinization is the chemical effect which increases the buffering capacity and therefore the available carbon in the system. (Jones-Wisconsin)

SEASONAL ABUNDANCE AND VERTICAL DISTRIBUTION OF CRUSTACEAN ZOOPLANKTON IN A COLOURED DYSTROPHIC LAKE IN NORTHEASTERN ONTARIO,
Atomic Energy of Canada Ltd., Chalk River (Ontario). Environmental Research Branch.
J. W. McMahon.
Available from the National Technical Information Service as AECL 4312; $1.00 in paper copy, $1.45 in microfiche. Atomic Energy of Canada, Ltd., Report AECL-4312, January 1973. 26 p, 12 fig, 1 tab, 22 ref.

Descriptors: *Distribution, *Crustaceans, *Zooplankton, Dystrophy, *Canada, Copepods, Daphnia, Seasonal, Spatial distribution, Temporal distribution, Dominant organisms.
Identifiers: Diaptomus reighardi, Cyclops bicuspidatus, Bosmina coregoni, Daphnia catawba, Upper Bass Lake(Ontario), Chalk River(Ontario).

Information is provided on abundance and species numbers of net zooplankton present in one of the numerous colored-water lakes lying within the eastern limits of the Precambrian Shield. Weekly plankton samples were collected at 10 stations in upper Bass Lake, Ontario. Twelve species of crustacean plankton were identified, consisting of seven copepods and five cladocerans. Maximum observed abundance, seasonal and vertical distribution were also noted. Histograms show vertical distribution and weekly abundance of the different species. The calanoid copepod Diaptomus reighardi, the most abundant crustacean was found in the plankton throughout the year. Several species of Cladocera were present, Bosmina coregoni and Daphnia catawba being the second and third most dominant crustacea in the zooplankton community. Four dominants were noted consisting of Diaptomus reighardi (29.5%), Cyclops bicuspidatus (15.2%), Daphnia catawba (19.2%) and Bosmina coregoni (22.4%). Tropocyclops prasinus, while not dominant, accounted for 5% of the total crustacean population. The ratio of total Copepoda to total Cladocera for each of the three years remained constant with the copepods accounting for approximately 60% of the zooplankton. (Jones-Wisconsin)
W74-07467

SOME ASPECTS OF THE TEMPERATURE, OXYGEN AND NUTRIENT DISTRIBUTIONS IN MONTEREY BAY, CALIFORNIA. ANNUAL REPORT, PART 1, 1973,
Moss Landing Marine Labs., Calif.
W. M. Smethie, Jr.
Available from the National Technical Information Service as COM-73-11648; $4.25 in paper copy, $1.45 in microfiche. Technical Publication 73-1, 1973. 97 p, 29 fig, 12 tab, 41 ref, 2 append. NOAA SGP2-94.

Descriptors: *Bays, *Temperature, *Dissolved oxygen, *Nutrients, *Distribution, *California, Water circulation, Upwelling, Tides, Photosynthesis, Nitrates, Phosphates, Ammonia, Outfall sewers, Tidal effects, Seasonal, Oceanography, Physical properties, Chemical properties, Dispersion.
Identifiers: *Monterey Bay(Calif.), Flushing.

Seasonal changes, seasonal cycles, upwelling, general water movement, nutrient-oxygen relations and salinity were surveyed in Monterey Bay. Three oceanographic periods occur in the bay: The Davidson Current period November to February, upwelling period February to September, and oceanic period from September to November. Seasonal variations were similar for the canyon area of the bay and nearshore areas. Over the head of Monterey Submarine Canyon, daily variations of physical and chemical parameters can be as large as seasonal variations. Upwelling apparently occurred in the submarine canyon during all months except perhaps March and April 1972. The average ratio of delta apparent oxygen utilization: delta nitrate: delta phosphate was 279:14:1 by atoms of O, N, and P and is in good agreement

with the expected O:N:P ratio of 276:16:1. Rates of carbon fixation were estimated from phosphate uptake, nitrate uptake, and oxygen production rates. Nitrate was observed to be the limiting nutrient. Residence time of water during upwelling was estimated to average 3 to 8 days in the northern and southern ends of the bay. Ammonia concentrations were highly variable with time and showed no seasonal trend. (Jones-Wisconsin)
W74-07469

NUTRITIVE IMPORTANCE AND STRUCTURE OF DETRITUS,
A. G. Rodina.
Available from the National Technical Information Service as NRC TT1625, $3.00 in paper copy, $1.45 in microfiche. National Research Council of Canada, Ottawa, Technical Translation 1625, 1972. 11 p, 4 fig, 35 ref. Translated from Biologicheskie Resursy Vodoemov. Puti ikh Rekonstruktsii i Ispol'zovaniya Izdatel'stvo 'Nauka, Moscow 1966, p 35-42.

Descriptors: *Nutrients, *Detritus, *Benthic fauna, Productivity, Bacteria, Microorganisms, Proteins, Vitamins.
Identifiers: *Structure of detritus.

The common characteristic of detritus is its heterogeneity. The sources, components, and nutritional value of detritus in various waters are discussed. The development of fluorescent techniques makes it possible to investigate its structure. Detritus consists of a complex conglomeration of organic substances serving as substrate for development of an immendsely rich microorganism population. Every minute particle is saturated with bacteria and contains live microalgae, various protozoans, and rotifers; a detrital particle is a seat of high bacteriological activity at the water-particle interface. The structure of detritus is closely related to the nature of the water body, the development of life in it, and the time of year. Rivers carry mostly detritus digested by bacteria, broken up into minute particles by water, and containing large quantities of live microscopic algae. The absorption of dissolved and colloidal material by organic and inorganic particles is of great importance in the alteration of detritus and for the development of microorganisms in it. Different origins of detritus and predominance of either plant or animal remains determine the development of its bacterial processes, which, in turn, determines its pH. Detritus is a source of proteins, vitamins, and other biostimulants in the nutrition of aquatic animals. (Jones-Wisconsin)
W74-07471

FIELD AND EXPERIMENTAL STUDIES ON THE SYSTEMATICS AND ECOLOGY OF ULVA CURVATA AND ULVA ROTUNDATA,
North Carolina Univ., Chapel Hill. Dept. of Botany.
C. F. Rhyne.
Available from the National Technical Information Service as COM-73-10783, $3.00 in paper copy, $1.45 in microfiche. University of North Carolina, Sea Grant Publication UNC-SG-73-09, March 1973. 123 p, 26 fig, 5 tab, 167 ref.

Descriptors: *Marine algae, *Systematics, *Estuaries, Life history studies, *Bioindicators, Salt marshes, Eutrophication, Cytological studies, Water pollution effects, Biorhythms, Ecology, *North Carolina.
Identifiers: *Ulva curvata, *Ulva rotundata, Eastern U.S. coasts, Calico Creek(N.C.).

With its sessile habit, simple morphology and handling ease in culture, Ulva and similar macrobenthic algae may be especially useful as indicators of nutrient pollution in eutrophication of marine and estuarine environments. To understand their taxonomy and ecology, Ulva curvata (marsh-like habitats) and Ulva rotundata (more saline habitats) were studied. To establish distribution of U. curvata, mating studies were carried out with plants from the principal research site in Calico Creek, North Carolina and material from Georgia and New Jersey. Male and female gametes released from thalli obtained at each locality mated with gametes from Calico Creek material and produced viable zygotes which germinated normally. Life cycle of U. curvata was demonstrated in field and laboratory studies to involve an alternation of isomorphic gametophyte and sporophyte generations. While all nuclear phases and growth forms appear to be connected to one another by meiosis and syngamy, somatic diploidization of female plants leading to parthenosphorophytes is frequent. Germination, early development, thallus growth, reproduction and senescence were investigated under laboratory conditions to account for life history and ecological adaptations of U. curvata observed in the field. These studies demonstrate that Ulva can serve as important indicators of eutrophication. (Jones-Wisconsin)
W74-07473

AN INVESTIGATION OF THE PHYSICAL IMPACT OF SEWAGE OUTFLOW ON A RIVER-ESTUARINE ENVIRONMENT,
Naval Academy, Annapolis, Md.
D. D. Wagner.
Available from the National Technical Information Service as AD-769 514, $3.50 in paper copy, $1.45 in microfiche. A Trident Scholar Project Report No 50, May 1973. 69 p, 9 fig, 5 tab, 30 ref, 3 append.

Descriptors: *Mathematical models, *Waste dilution, *Estuaries, *Rivers, Dispersion, Physical properties, *Maryland, Currents(Water), Outfall sewers, Tidal effects, *Chesapeake Bay, Nutrients, Computer programs, Density stratification, Salinity, Convection.
Identifiers: Eastport(Md.), Severn River(Md.), River-estuarine environment.

The possible physical impact of sewage discharges into the Severn River from the treatment plant located in Eastport, Maryland is described. Problems result because the system does not behave entirely in either a riverine or esturine manner. Using the classification of a river-estuarine environment, which incorporates characteristics of both rivers and estuaries, allows design of a numerical flushing model that predicts excess sewage concentrations in the river-estuary. Several runs were conducted with the model to determine the impact of the sewage. A buoyant plume model of the behavior of the sewage upon introduction to the receiving water indicates dilution to a 3% sewage concentration by the time the waste reaches the surface. Bottom currents were investigated and compared with surface flows to assess their effect on dispersion of the contaminants. Finally, a tidal flushing model was constructed that predicts a uniform sewage pollution excess over the conditions of the Chesapeake Bay of approximately .05% throughout the Severn. Effects of various environmental changes are discussed as predicted by modification of the numerical model. Under present circumstances, no detrimental physical impact on the environment was shown to exist. (Jones-Wisconsin)

THE PLANKTON OF PONDS ENRICHED WITH WASTES FROM BEET SUGAR FACTORIES,
Polish Academy of Sciences, Krakow. Zaklad Biologii Wod.
K. Kyselowa.
Acta Hydrobiologica, Vol 15, No 1, p 51-88, 1973. 7 fig, 5 tab, 60 ref.

Descriptors: *Sewage lagoons, *Plankton, Sugar beets, *Food processing industry, Phytoplankton, Zooplankton, Self-purification, Chlamydomonas, Euglena, Euglenophyta, Biochemical oxygen demand, Wastes, Stagnant water, Rotifers, Crustaceans, Cyanophyta, Biomass, Eutrophication, Succession, Systematics, Waste treatment.
Identifiers: *Sugar beet processing wastes, *Poland

The effect of sugar factory effluents on waste ponds in Poland was investigated by characterization of phyto- and zooplankton populations. Phytoplankton was represented by 293 systematic units, consisting of 241 species with varieties and forms. Certain taxons were determined from the Cyanophyceae, Euglenophyceae, Cryptophyceae, Flagellata apochromatica, Volvocales, Chlorococcales and Conjugales. In the zooplankton 63 species and 33 higher systematic units were determined. The succession of individual groups of plankton followed in four stages whose length was affected by the concentration of wastes. Stage I (heterotrophy) showed the beginning of development of Volvocales and Euglenophyceae and an almost total lack of zooplankton. It was a period of high biochemical and chemical oxygen demand and of oxygen deficit. Stage II (hyperautotrophy) was characterized by the appearance of Chlorococcales and Cryptophyceae with growing numbers of zooplankton (mainly rotifers). It was correlated with a further decrease in biochemical and chemical oxygen demand and with a high oxygen content. In the IIId (transition stage), a decrease in algal numbers and an increase in Cladocera were observed. Stage IV was characterized by stabilization of the chemical conditions and by the formation of phyto- and zooplankton communities characteristic of normally utilized ponds. (Jones-Wisconsin)

UTILIZATION OF ERTS-1 DATA TO MONITOR AND CLASSIFY EUTROPHICATION OF INLAND LAKES,
Bendix Aerospace Systems Div., Ann Arbor, Mich.
P. E. Chase, and V. E. Smith.
Available from the National Technical Information Service as N-73-18331, $5.50 in paper copy, $1.45 in microfiche. Report No BSR 4010, February 1973. 70 p, 35 fig, 2 tab, 40 ref, NAS 521810.

Descriptors: *Satellites(Artificial), *Remote sensing, *Eutrophication, Classification, Lakes, Algae, Detritus, Monitoring, Color, Water quality, Trophic level, *Michigan, Baseline studies, Data transmission, Computers, Spectrophotometry, Technology.
Identifiers: *ERTS-1, Computer compatible tapes, Imagery interpretation, Spectral bands, Oakland County(Mich.).

Preparation phase accomplishments and accomplishments during the initial review of Earth Resources Technology Satellite (ERTS-1) are described. The capability of ERTS-1 to resolve different sizes and shapes of lakes in each MSS band is necessary to correlate ERTS-1 data to lake water color. Water quality data collected over the past three years have been tabulated and compared for the purpose of classifying four Michigan lakes as to relative trophic level. Although all four are mildly to moderately eutrophic, they can be arranged in a series of increasing enrichment. Further study of these lakes is being carried out by the Cranbrook Institute of Science. The 'baseline'

a on water quality have been considered care-
ly in setting up the water analysis procedures
concurrent ERTS and ground monitoring of
es. Any such monitoring program must be a
mpromise between expediency and data yield,
ce full coverage of all the lakes within two
irs of the ERTS overflights is highly desirable.
ien computer compatible tapes are available,
image density patterns on selected lakes can be
npared to their bathymetry and to low altitude
agery to determine whether variations in water
or are recorded by ERTS. (Jones-Wisconsin)

scriptors: *Seeds, *Grasses, *Germination,
ant growth, *North Carolina, Nutrients, Soil
perties, Salinity, Mathematical models, Salt
rshes, Estuaries, Nitrogen, Phosphorus, Potas-
m, Iron, Bank stabilization, Storage.
ntifiers: *Spartina alterniflora, Propagation,
t marsh cord grass.

rtina alterniflora is the dominant plant of inter-
l zone of bays and estuaries along nearly all the
t coast of North America. Effect of seed
rces and storage treatments on viability of its
d and seed plant performance in North
rolina estuaries is reported. Under favorable
ditions, S. alterniflora produces large quanti-
of viable seed. Seed should be collected from
prous stands and stored overwinter submerged
stuarine or sea water at temperatures around 2-
Field experiments have shown that direct
ding can be effective in establishing new stands
dredge spoil material. Results indicate tissue
centrations of several nutrients and several soil
perties are significantly associated with varia-
ns in yield and height of S. alterniflora. The im-
tance of Mn and S in both the yield and height
ations and Fe in the height equation suggest in-
tigation into influence of chemical effects of
erlogging of the marsh soil. Increased growth
S. alterniflora in response to applications of fer-
er indicates that the productivity of some salt
rshes is limited by nutrient supplies. Nitrogen
P fertilizers were shown to enhance growth of
dlings and transplants artificially established on
dge spoil. (Jones-Wisconsin)

dies of ice organisms near Barrow, Alaska
wed that the shore-fast ice is a habitat for a
tively complex assemblage including diatoms,
nented and non-pigmented dinoflagellates and
ellates, and ciliates. Samples were collected,
d measurements made and laboratory studies performed. Species from each station in five locations were investigated and are listed. The deep-water stations were sampled to see if the spring phytoplankton bloom was occurring in the sea-water under the ice and to try to determine the areal extent of the organism layer in the bottom few centimeters of ice. The sampling technique had possed a problem as pieces of ice would break from the core and be lost. When ice cores are brought to the surface, cells are exposed to extremes of temperature and light whose effect is not known. Melting the ice at room temperature may also affect the cells. Small flagellates seem to be the most abundant organisms found in new ice in the fall. Perhaps many of the ice organisms, especially the diatoms, are benthic species which may be brought into the water column during the fall storms and remain long enough to become trapped as the ice forms. A recently discovered kelp bed is described. (Jones-Wisconsin)

POSSIBLE EFFECTS OF CONSTRUCTION AND OPERATION OF A SUPERTANKER TERMINAL ON THE MARINE ENVIRONMENT IN NEW YORK BIGHT,
State Univ. of New York, Stony Brook. Marine Sciences Research Center.
J. L. McHugh, J. J. Ginter, W. E. Knapp, A. L. Tsao, and M. D. Greenfield.
Available from the National Technical Information Service as PB-219 649, $3.00 in paper copy, $1.45 in microfiche. Final Report to Council on Environmental Quality, Washington, D.C. November 15, 1972. 213 p, 55 fig, 17 tab, 119 ref.

Descriptors: *Environmental effects, *Offshore platforms, *Harbors, *Projections, *Water pollution sources, New York, Dredging, Structures, Disposal, Oil spills, Ships, Coasts, Oil industry, Construction, Import, Pipelines, Biota, Connecticut, New Jersey, Economic justification, Value, Geology, Physical properties, Chemical properties.
Identifiers: *New York Bight, *Supertanker terminals, Offshore ports, Sandy Hook Bay(Conn.), Raritan Bay(N.J.).

Environmental effects of construction and operation of supertanker terminals are assessed by evaluating specific sites in the New York Bight. Information was obtained entirely from the existing literature and from discussions and correspondence. Oil and oil products made up at least one quarter of the cargoes transported by marine traffic. Physiography, geology, physical aspects, chemical aspects, and marine resources of New York Bight are presented. Adverse construction effects on the environment and biota will be much less at offshore sites than in Sandy Hook Bay. Sites in the New York Bight area are ranked on the basis of the effects of construction alone and in descending order to preference: Castle Hill, Tobay Beach, and Sandy Hook Bay. The effects and possible effects of dredging on the marine environment are described. In regard to Raritan Bay, a major supertanker terminal is not consistent with plans for pollution abatement. Environmental effects of supertanker terminal operation appear to be related primarily to chronic oil leakage or accidental spills. The Tobay Beach site, farther offshore and in deeper water than the Castle Hill site, may be less desirable because it might interfere with commercial clamming and fishing operations. (Jones-Wisconsin)

KELP HABITAT IMPROVEMENT PROJECT, ANNUAL REPORT JULY 1, 1970 - JUNE 30, 1971.
California Institute of Tech., Pasadena. W. M. Keck Lab. of Environmental Health Engineering.
Available from the National Technical Information Service as COM-73-10861, $4.50 in paper copy, $1.45 in microfiche. (1971). 159 p, 49 fig, 22 tab, 41 ref. Sea Grant GH-92.

Descriptors: *Resources development, *Kelps, *Habitats, Life history studies, Animal parasites, Animal diseases, Epizootiology, Marine animals, Nutrients, Amino acids, Reproduction, Pest control, Grazing, *California, Phaeophyta, Limiting factors, Cultures, Planting management, Control.
Identifiers: *Kelp beds improvement, *Macrocystis, *Sea urchins control, Lytechinus.

Kelp beds are believed to contribute significantly to coastal biology and the kelp community is an important marine resource. About 1940, persistent deteriroation began of certain kelp beds off the southern California coast. By 1960, a number of significant kelp areas had dwindled to scattered patches or entirely disappeared. It was concluded that in addition to the recent damage caused by a period of warm water, hordes of grazing sea urchins were destroying large quantities of kelp and preventing normal reforestation. Loss of an important natural urchin predator, the sea otter, may have contributed to the situation. It was possible to restore more than half of a deteriorated kelp area off Point Loma solely by urchin control measures. During 1970-71, dispersion of kelp embryos was first attempted on a large scale. Final phases of a research project on nutrition of sea urchins are reported. A facility for mass-culturing Macrocystis (kelp) embryos went into operation December 1970. Studies were made on sea urchins including commensals and parasites, internal conditions, juveniles and larval urchins, and urchin diseases. Autoradiographic analysis confirmed previous finds that urchins can remove dissolved amino acids from sea water in low concentrations. (Jones-Wisconsin)

KELP HABITAT IMPROVEMENT PROJECT, ANNUAL REPORT JULY 1, 1971 - JUNE 30, 1972.
California Institute of Tech., Pasadena. W. M. Keck Lab. of Environmental Health Engineering.
Available from the National Technical Information Service as COM-73-10862, $4.75 in paper copy, $1.45 in microfiche. (1972). 200 p, 57 fig, 18 tab, 14 ref. Sea Grant GH-92.

Descriptors: *Resources development, *Kelps, *Habitats, *California, Marine animals, Marine algae, Grazing, Life history studies, Nutrient requirements, Competition, Limiting factors, Cultures, Reproduction, Pest control, Planting management, Control, Methodology.
Identifiers: *Kelp beds improvement, *Macrocystis, Sea urchin control.

Rehabilitation of the deteriorating kelp beds off the southern California coast is discussed. Persistent deterioration of Macrocystis began about 1940 due to an interval of warm temperatures followed by grazing of vast numbers of sea urchins who were destroying the remains of several important kelp beds. Preliminary experimentation revealed that dispersal of embryonic Marcrocystis sporophytes yielded modest numbers of juvenile plants. A kelp-culturing facility was constructed in 1970 and began producing large scale cultures in 1971. Kelp restoration activities in San Diego, Orange, and Los Angeles Counties are reported. Grazer control operations were carried on at Abalone Cove. Dispersals of cultured kelp embryos indicated that pretreatment of the bottom with quicklime enhanced ability of tiny plants to become established. Significant kelp beds appeared between Corona del Mar and Pelican Point during 1971-72. Large numbers of juvenile plants were recorded off Corona del Mar. Times of appearance and distribution of the small plants correlated well with times and sites of the kelp embryo dispersal operations. A preliminary model of relations between grazing fishes and kelp resources was developed. Techniques for emplanting PVC rings bearing cultures of tiny kelp plants onto the sea floor were developed. A STRATEGY FOR MODELING PRIMARY PRODUCTION IN STRATIFIED FJORDS,
Washington Univ., Seattle. Dept. of Oceanography.
D. F. Winter, and K. Banse.
In: Proceedings 2nd Annual Technical Conference on Estuaries on the Pacific Northwest, March 16-17, 1972. Oregon State Univ., Corvallis (Engineering Experiment Station Circular No 44), p 30-41 (1972). 9 fig, 1 tab, 21 ref.

Descriptors: *Mathematical models, *Primary productivity, *Fjords, Pacific coast region, Zooplankton, Phytoplankton, Inlets(Waterways), Estuaries, Mixing, Hydrodynamics, Eutrophication, *Washington, Circulation, Hydrography.
Identifiers: *Puget Sound(Wash).

Most numerical phytoplankton models are based on a conservation equation that attributes algal biomass variations to photosynthetic respiratory activity, sinking of cells, herbivore grazing, and to mixing and advection in the medium. In some inlets, or segments thereof, certain numerical tasks can be obviated by using approximate expressions for hydrodynamic variables derived by using similarity techniques. This procedure is described. The general approach is illustrated with a model of springtime phytoplankton blooms in the main basin of Puget Sound in the spring 1966. Those features of inlet flow which are relevant to the problem are reviewed. To avoid incapacitating complexity, attention is confined to primary production in a steep-sided, relatively straight fjord segment. From modeling experiments with data from zooplankton hauls, the conclusion is that grazing pressure by herbivores probably does not reduce the chlorophyll density in Puget Sound by more than 10% to 20% during blooms. Although conclusions are still tentative, a reasonable, self-consistent picture of phytoplankton ecology in deep inlets is emerging. It is believed that the modeling strategy described will enable specification with some confidence of environmental factors which control algal blooms in Puget Sound system and elsewhere. AN ECOSYSTEM STUDY IN THE INSIDE PASSAGE OF SOUTHEASTERN ALASKA,
Oregon State Univ., Corvallis. Dept. of Oceanography.
H. C. Curl.
In: Proceedings 2nd Annual Technical Conference on Estuaries of the Pacific Northwest, March 16-17, 1972. Oregon State Univ., Corvallis (Engineering Experiment Station Circular No 44), p 42-49 (1972). 5 fig, 1 tab, 10 ref.

Descriptors: *Bays, *Alaska, *Productivity, Estuaries, Nutrients, Plankton, Enzymes, Zooplankton, Nitrogen, Amino acids, Nitrates, Ammonia, Eutrophication, Phytoplankton, Light intensity, Model studies, Mixing.
Identifiers: *Auke Bay(Alaska), Alaska Inside Passage.

In Auke Bay near Juneau and the Alaskan Inside Passage there is a strong, two-layered circulation in summer, upwelling is frequent, seasonal cycles are similar from year to year, zooplankton usually occur as a single, mid-summer pulse, and most chemical and biological properties, except zooplankton, are homogeneously distributed in the horizontal plane. A study was made of the differences in the activity of the enzyme nitrate reductase between Thalassiosira and Skeletonema. Effect of light intensity on nitrate assimilation and nitrate supported growth of the two organisms was studied. The sequence of events is now thought to be that the initial spring bloom is initiated by the onset of stability, increasing solar radiation, and high levels of initial nutrients. Species composition at this time is controlled by temperature acting on enzymatic processes and by nutrient availability. Subsequent blooms and their composition are controlled by periodic wind mixing, replenishing nutrients from beneath the pycnocline, in situ nutrient regenerations by grazing zooplankton, or possibly, directly from phytoplankton, advection and stream flow, rainfall, and grazing by zooplankton. The biological response varies according to the interactions of the forcing functions. (See also W74-07491) (Jones-Wisconsin)

EVALUATION OF METHODS OF PUMPING TEST ANALYSES FOR APPLICATION TO HAWAIIAN AQUIFERS,
Hawaii Univ., Honolulu. Water Resources Research Center.
J. A. Williams, and R. L. Soroos.
Technical Report No 70, July 1973. 159 p, 64 fig, 46 tab, 74 ref, append.

Descriptors: *Aquifers, Analytical methods, Drawdown, *Pumping, Transmissivity, Hydraulic conductivity, Anisotropy, Geology, *Hawaii, Logging(Recording), *Aquifer testing, *Well data, *Methodology, Storage.

Pumping test data from eight locations including the islands of Oahu, Maui, and Molokai were selected and analysed. The test data were selected on the basis of completeness, reliability, and aquifer type and boundary conditions involved. Analyses included the standard Theis, Thiem, and Jacobs methods as well as those techniques which deal with boundaries (Stallman method), partial penetration of the well (Hantush-Theis method), leaky aquifers (Walton method), and anisotropy (Hantush method for anisotropic aquifers). In addition, the Zanger method for partially penetrating wells and equilibrium data was also used. Results of the several different analyses were compared and recommendations made as to which method or combination of methods seemed best suited for Hawaii aquifers. In the case of the principal basal aquifer, the Hantush-Theis method for non-equilibrium data or the Zanger method for equilibrium data are recommended. In the event that leakage or boundaries are a factor, the former method used with early-time data is recommended.

AN EPIDEMIOLOGICAL STUDY ON CLONORCHIS SINENSIS AT THE NORTHERN PART OF WAKAYAMA PREFECTURE, MIDDLE JAPAN, (IN JAPAN),
Kyoto Prefectural Univ. of Medicine (Japan). Dept. of Medical Zoology.
Misao, Nagahana, Yukio Yoshida, Kikuo Matsuo, Horohito Sugihara, and Kaoru Kondo.
Jap J Parasitol. Vol 21, No 2, p 96-100, 1972, Illus. (English summary).
Identifiers: *Clonorchis-Sinensis, *Epidemiological studies, Gnathopogon-Elongatus-Elongatus, *Japan(Wakayama), Parafossarulus-Manchouricus, Pseudorasbora-Parva.

An epidemiological study on C. sinensis was carried out at the northern part of Wakayama Prefecture, middle Japan during the period from 1964-1970. The first intermediate host snail, Parafossarulus manchouricus, was detected from 9 ponds and 1 river out of 62 stations examined. Two kinds of freshwater fishes (154 in total num Gnathopogon elongatus elongatus and dorasbora parva, were collected from the where the snail host was abundantly found out of 136 former fish and in 4 out of 18 latte the metacercaria of C sinensis was infected minimum number of the metacercaria per fis 1, and the maximum was 32. In order to clarif human infection with this fluke, 286 specimens were collected from farm vi located close to the ponds where the interme hosts were found. As the result, C. sinensis were detected in 5 persons (1.8%).--Copy 1973, Biological Abstracts, Inc.

Identifiers: *Bacterial films, *Substrate utili tion, Thickness, Oxygen diffusion, Film dens Flavobacterium, Bacillus, Micrococc Microbacterium, *Glucose.

nvestigation was initiated to determine the ef- of thickness on the nutrient utilization city of bacterial films, that is, whether that remains constant or decreases as the film h increases. Bacterial films were developed in ratory-scale rotating cylinders. Lyophilized and cultures maintained on agar were used to ulate a drum at the beginning of any particular ring operation. The isolates were identified as nging to the genera Bacillus, Micrococcus, domonas, Flavobaterium, and Microbacteri- Ten sections of each cylinder could be ved so that film thickness could be measured dically. A shallow stream of synthetic media ed continuously through the cylinders during ulturing operations, and the differences in in- t and effluent concentrations of organic er were used to calculate nutrient uptake . These rates were examined as functions of ness. In one series of studies, film solids were sured and examined as functions of thickness. ient uptake rates attained a maximum at ness between 100 and 150 microns and, if all were composited, appeared to stabilize. n data from individual experiments were ex- ed separately, however, nutrient utilization n decreasing between 100 and 150 microns, nuing until the films were approximately 400 ons thick. Beyond that thickness, the rates in- ed again to their former levels. (Mortland- elle)

ifiers: *Algal physiology, *Synechococcus us, *Photoproduction, Thermophilic algae, ochemistry, Substrate utilization, Biosynthes- Thiosulfates, Plant metabolism, 3-(3 4- lorophenyl)-1 1-dimethyl urea, fluoroacetic acid, Photoreduction, Carbonyl lorophenyl-hydrazone, Quantitative analysis, ose, Glucose, Sodium monofluoroacetate.

r anaerobic conditions and in the absence of the thermophilic blue-green alga chococcus lividus Y52-s evolved hydrogen le in both darkness and light. The mechanism is process was investigated and compared photo- and dark reductions in organisms senting several phyla. The photoproduction 2S from either sulfate or thiosulfate was in- d by 3-(3,4-dichlorophenyl)-1, 1-dimethyl (DCMU) and carbonyl m-chlorophenyl- azone (m-C1-CCP). The inhibitory effect of U showed the requirement for photosysytem electron donor. Inhibition by m-C1-CCP also cated ATP as an energy source. fluoroacetate partially inhibited production of H2S. This indicated that ox- e metabolism may act as a source of elec- to reduce the photooxidant under certain itions. Thiosulfate acts only as electron ac- r and is reductively cleaved to sulfide and e ions. Thiosulfate and sulfate appeared to ce CO2 in the light and O2 in darkness as ron acceptors. The phosphorylation un- lers dinitrophenol and m-C1-CCP stimulated H2S production. (Holoman-Battelle)

ECT OF LIGHT INTENSITY AND CEROL ON THE GROWTH, PIGMENT

COMPOSITION, AND ULTRASTRUCTURE OF CHROOMONAS SP.,
Smithsonian Institution, Rockville, Md. Radiation Biology Lab.
M. A. Faust, and E. Gantt.
Journal of Phycology, Vol 9, No 4, p 489-495, December 1973. 7 fig, 1 tab, 17 ref.

Descriptors: *Plant growth, *Plant pigments, *Light intensity, Environmental effects, Solvent extractions, Aquatic algae, Electron microscopy, Carbohydrates, Plant physiology, Cultures.
Identifiers: *Chroomonas, *Glycerol, *Ultrastructure, *Algal physiology, Sample preparation, Heterotrophic nutrition, Cryptomonads, Chlorophyll a, Chlorophyll c, Phycocyanin, Culture media, Substrate utilization, Sugars.

Growth of Chroomonas sp. increased with light intensity (100, 1800, and 2700 microwatts/sq cm) with a five-fold increase from the lowest to the highest intensity. Chlorophyll and phycocyanin content per cell were greater in cells grown at low light intensity, but the ratio of chlorophyll a and c did not vary appreciably. Cells grown at low light intensity had 30 percent more phycocyanin than cells grown at high intensities of light. The chloroplast of cells with the higher phycocyanin content had average intrathylakoidal widths of 300 A, whereas those cells with the lower phycocyanin content had average intrathylakoidal widths of 200 A. This result is compatible with the hypothesis that phycocyanin is located in the intrathylakoidal spacein the cryptophyte algae. Of the various energy sources tested, only glycerol was able to support limited growth under nonphotosynthetic conditions. Under no condition was the chloroplast reduced to an etioplast or proplastid state. Starch accumulation was greatest in cells grown in continuous white light in glycerol. Eyespots were commonest in cells grown in darkness and interrupted every 24 hr by a few seconds of white light. It was concluded that this organism is an obligate phototroph. (Holoman-Battelle)

A CONTINUOUS CULTURE STUDY OF PHOSPHATE UPTAKE, GROWTH RATE AND POLYPHOSPHATE IN SCENEDESMUS SP.,
New York State Dept. of Health, Albany. Div. of Labs. and Research.
G-Y. Rhee.
Journal of Phycology, Vol 9, No 4, p 495-506, December 1973. 16 fig, 1 tab, 62 ref.

Descriptors: *Phosphates, *Growth rates, *Scenedesmus, *Absorption, *Path of pollutants, Kinetics, Cultures, Plant growth, Aquatic algae, Phosphorus, Lipids, Nutrients, Plant physiology.
Identifiers: *Polyphosphates, Continuous cultures, *Algal physiology, Substrate utilization, Enzyme activity, Enzymatic inhibitors, Substrate concentration, Sample preparation, Alkaline phosphatase.

The kinetics of phosphate uptake and growth in Scenedesmus sp. have been studied in continuous culture with particular reference to the shifts in the cellular P compounds as a function of growth rate. Uptake velocity is a function of both internal and external substrate concentrations and can be described by the kinetics of noncompetitive enzyme inhibition. The concentrations of polyphosphates (alkali-extractable or 7-min) can be substituted as inhibitors in the kinetic equation. The apparent half-saturation constant or uptake, K sub m, is 0.6 microM, growth is less than K sub m by 1 order of magnitude. Growth is a function of cellular P concentrations, and the polyphosphates (alkali-extractable or 7-min) appear to regulate growth rate directly or indirectly. To understand P limitation, therefore, it is necessary to measure both external P and internal polyphosphate levels. Evidence indicates that alkali-extractable polyphosphates, which can be quantitatively determined by a simple method of measuring surplus P, are involved in cell division process and that a maintenance concentration of functional phosphate exists in the form of polyphosphates. Alkaline phosphatase activity has an inversely linear relationship to growth rate and to the reciprocals of both polyphosphates and surplus P. Changes in lipid P, RNA P, and presumably all other forms except DNA are related to changes in growth rate. (Holoman-Battelle)

THE EFFECT OF SELENITE ON THE PHYSIOLOGICAL AND MORPHOLOGICAL PROPERTIES OF THE BLUE-GREEN ALGA PHORMIDIUM LURIDUM VAR. OLIVACEA,
Medical Coll. of Ohio, Toledo. Dept. of Microbiology.
M. Sielicki, and J. C. Burnham.
Journal of Phycology, Vol 9, No 4, p 509-514, December 1973. 6 fig, 16 ref.

Descriptors: *Plant morphology, *Cyanophyta, *Bioassay, Photosynthesis, Inhibition, Plant growth, Water pollution effects, Plant physiology, Aquatic algae, Poisons, Lethal limit, Proteins, Pollutants.
Identifiers: *Phormidium luridum var. olivacea, *Selenite, *Algal physiology, Pollutant effects, Light microscopy, Sodium selenite.

Phormidium luridum cultures were treated with sodium selenite in concentrations ranging from 1 microM to 0.01 M. In contrast to the increasing culture turbidity of control and 1 microM selenite cultures, the turbidity of the other selenite cultures declined in proportion to time and selenite concentration. Chlorophyll extraction revealed similar results. Photosynthetic activity was inhibited within 6 hr in all cultures except control and 1 microM selenite. Phormidium at concentrations greater than 1 microM selenite showed a gradual loss of the bright green color and turned semitransparent. Cell-associated granules of reduced selenium were observed at higher selenite concentrations. Other structural changes observed were the presence of intracellular and intercellular spaces, spheroplast formation, and gradual cell lysis. Protein analyses of total cell samples and supernatant fractions confirmed cellular breakdown of selenite-treated algal cells. (Holoman-Battelle)

BYGLANDSFJORDEN. PRIMARY PRODUCTION AND OTHER LIMNOLOGICAL FEATURES IN AN OLIGOTROPHIC NORWEGIAN LAKE,
Oslo Univ. (Norway). Dept. of Limnology.
A. Lande.
Hydrobiologia, Vol 42, Nos 2-3, p 335-344, August 15, 1973. 3 fig, 2 tab, 14 ref.

Descriptors: *Primary productivity, *Trophic level, *Water quality, *Oligotrophy, Dissolved oxygen, Hydrogen ion concentration, Specific conductivity, Calcium, Magnesium, Sodium, Potassium, Chlorides, Alkalinity, Sulfates, Water analysis.
Identifiers: *Norway(Byglandsfjorden).

Byglandsfjorden is a lake situated in southern Norway, about 80 km north of Kristiansand. The catchment area consists of archean rocks. The river Otra flows through the lake. Water samples were taken from the lake 4 times during the summer of 1971, and analyzed for DO, pH, specific conductivity, Ca, Mg, Na, K, alkalinity, chloride, and sulfate. Primary productivity was measured three times by the C-14 method. The results show that the lake is acid and poor in electrolytes. pH-values vary between 5.3 and 6.0, and the specific conductivity lies at about 10. Primary production is rather high, and per sq m lake surface the values are about the same as in Svinsjoen, a rather eutrophic lake near Oslo. However, an index used by Rodhe (1965) shows that the lake is of a more oligotrophic type. (Little-Battelle)

HABITAT DISTRIBUTION OF THE SHORE FLIES OF NORTHEASTERN OHIO (DIPTERA: EPHYDRIDAE),
Kent State Univ., Ohio. Dept. of Biological Sciences.
J. F. Scheiring, and B. A. Foote.
The Ohio Journal of Science, Vol 73, No 3, p 152-166, May 1973. 10 fig, 19 ref.

Descriptors: *Ohio, *Aquatic habitats, *Ecological distribution, *Aquatic insects, Diptera, Seasonal, Animal populations, Shores, Mud, Sands, Grassed waterways, Floating plants.
Identifiers: *Shore flies, Species diversity, Limnic wrack, Sedge meadow, Marsh reed, Mud shore, Sand shore, Grass shore, Floating algal, Rain pool, Salt pool, Athyroglossa granulosa, Athyroglossa ordinata, Atissa litoralis, Ptilomyia enigma, Pseudohecamede, Allotrichoma, Discocerina obscurella, Hydrochasma buccatum, Diclasiopa lacteipennis, Ditrichophora, Polytrichophora orbitalis, Psilopa dupla, Leptopsilopa atrimana, Trimerina madizans.

A study of the babitat distribution of 68 species of shore flies (Ephydridae) was carried out in northern Ohio between April, 1968 and November, 1969. Ten ephydrid habitats were recognized: mud-shore, sand-shore, grass-shore, limnic-wrack, marsh-reed, sedge-meadow, floating-vegetation, floating-algal-mat, rain-pool, and salt-pool habitats. The mud shore contained the greatest diversity of Ephydridae, whereas the salt-pool habitat produced the largest populations. The floating algal mat possessed the fewest number of species, as well as the least number of individuals. Three species were recorded from Ohio for the first time: Atissia litoralis (Cole), Ephydra cinera Jones, and E. niveicips Cresson. A listing of all species collected, together with information on habitat from which taken abundance, and relation of data to other published material, is also included. (Holoman-Battelle)

EFFECTS OF TEMPERATURE ON ACTIVITY AND MORTALITY OF THE SCYPHOZOAN MEDUSA, CHRYSAORA QUINQUECIRRHA,
Maryland Univ. Prince Frederick. Natural Resources Inst.
A. J. Gatz, Jr., V. S. Kennedy, and J. A. Mihursky.
Chesapeake Science, Vol 14, No 3, p 171-180, September 1973. 6 fig, 3 tab, 23 ref.

Descriptors: *Water temperature, *Mortality, *Sea nettles, *Laboratory tests, *On-site tests, Marine animals, *Chesapeake Bay, Lethal limit, Jelly fish, Mature growth stage, Immature growth stage, *Maryland.
Identifiers: Activity, Chrysaora quinquecirrha, Coelenterates, Medusa, Scyphozoans, Data interpretation, Polyps, Pulsation rate.

Pulsation rate of Chrysaora quinquecirrha medusae was inversely and linearly related to bell diameter over the natural temperature range (15-32C) of this life history stage of the sea nettle in the upper Chesapeake Bay. At unnatural, elevated temperatures this relationship was disrupted. Pulsation rates generally increased with temperature increase from 15C to 30C and then decreased at higher temperatures. The rate-temperature curve for acclimated medusae was similar in shape (increase and decrease in pulsation rate with temperature change) to rate-temperature curves reported for warm water medusae; its shape was different from those reported for cold water medusae. Acclimation of pulsation rate to changed temperature was faster than acclimation of upper lethal temperature, although both were measured in hours. Upper lethal temperatures measured over 20-30C were directly related to acclimation temperature and were similar to those reported for sea nettle polyps (34-35C). Medusae were more sensitive than polyps to cold, with death occurring at 10C. Thermal discharges into the upper Chesapeake Bay which raise water temperature above 30C are probably stressful to sea nettle medusae. Temperatures above 38C could be lethal in a few minutes. (Holoman-Battelle)

Descriptors: *Antibiotics(Pesticides), *Salmonella, Domestic animals, Enteric bacteria, Aerobic bacteria, Water pollution sources, Resistance, Isolation, Poultry, Cattle, Hogs, Farm wastes.
Identifiers: *Tetracycline, *Ampillicin, *Chloramphenical, *Kanamycin, Drug resistance, Serotypes, Culture media, Salmonella dublin, Salmonella typhimurium, Salmonella anatum, Salmonella panama, Salmonella cholerae suis var. kunzendorf, Salmonella infantis, Salmonella montevideo, Salmonella eimsbuettel, Salmonella brandenburg, Salmonella bredeney, Salmonella derby, Salmonella enteritidis, Salmonella heidelberg, Salmonella manchester, Salmonella meleagridis, Salmonella mokola, Salmonella muenchen.

In 1969, 1970 and 1971 respectively, 11761, 13844 and 20053 Salmonella strains were screened for resistance to ampicillin, chloramphenicol and tetracycline. Each Salmonella strain was transferred to agar slants containing 25 micrograms of tetracycline, 50 micrograms of chloramphenicol, 25 micrograms of ampicillin or 25 micrograms of kanamycin per milliliter at pH 7.4. If growth occurred, the bacteria were identified again in order to exclude any possibility of contamination with drug-resistant bacteria of other species. If the same serotype was found, the degree of resistance was determined by tube-dilution assay on 5 percent sheep-blood agar slants made of nutrient agar pH 7.4 to which citrated sheep blood was added. The tubes were inoculated with one drop of a dilute suspension containing 1 million bacteria per ml in 0.85 percent NaCl solution. After incubation at 37 C for 20 hours any strain growing in tubes containing one of the above antibiotics at a concentration of 50 micrograms/ml was considered to be resistant. This drug level roughly corresponds to 10 times the normal minimal inhibitory concentration. It was found that in these years respectively 23.4 percent, 19.3 percent and 15.1 percent of the isolated strains were resistant to one or more of these antibiotics. Most strains appeared to be only tetracycline-resistant. Resistance to chloramphenicol remained low (0.56 percent and less). During 1971 64 kanamycin-resistant strains (0.32 percent) were isolated. Resistance was largely confined to S. typhimurium and S. panama. (Holoman-Battelle)

EFFECT OF RESTRICTED USE OF PHOSPHATE-BASED DETERGENTS ON ONONDAGA LAKE,
O'Brien and Gere Engineers Inc., Syracuse, N. Y.
C. B. Murphy, Jr.
Science, Vol 182, No 4110, p 379-381, October 26, 1973. 2 fig, 1 tab, 9 ref.

Descriptors: *Phosphates, Lakes, *Detergents, Legislation, Diatoms, Chlorella, Scenedesmus, *Cyanophyta, Chlorophyta, Hydrogen ion concentration, Nitrogen, Biochemical oxygen demand, Dissolved oxygen, *New York, Analytical techniques, Hypolimnion, Limiting factors, Sewage effluents, Water sampling, Carbon, Water quality, Epilimnion, Eutrophication, Nutrients.
Identifiers: *Onondaga Lake(NY), Oocystis, Orthophosphates, Aphanizomenon

A marked decrease in the concentration of total inorganic phosphate in the epilimnion and hypolimnion of Onondaga Lake, New York State, has been observed during the 1 1/2 years between July 1971 and January 1973. A monitoring program for Onondaga Lake has been carried out since 1968. Grab samples, collected every 2 weeks at 3-m intervals from the surface to the bottom at a station located in the southern basin, have shown decreases of 85 and 76 percent in the average condensed inorganic phosphate concentrations in the epilimnion and hypolimnion, respectively. The orthophosphate concentrations were found to decline by 47 and 15 percent, respectively, over the same period of time. Standard analytical procedures were used to determine the concentrations of total orthophosphate, total inorganic phosphate, and the derived value for total condensed inorganic phosphate. In the past 5 years, a characteristic seasonal succession of phytoplankton has been observed within the lake. There is little growth of plankton in the winter, when the lake is covered by ice; a diatom population develops in the spring; and the green algae Chlorella, Scenedesmus obliquus, Scenedesmus quadricauda, and Oocystis parva dominate the summer period. Blue-green algae of the genus Aphanizomenon follow the die-off of the greens, and dominate the late summer and early fall. In 1972, Aphanizomenon was absent in the succession. Instead, the green algae blooms continued through the summer and fall with cell counts comparable to those measured in previous years. It appears that the alteration of the phytoplankton seasonal succession is the result of reducing the phosphorus concentrations in the photic zone. (Mortland-Battelle)

ACETYLENE REDUCTION BY BEIJERINCKIA UNDER VARIOUS PARTIAL PRESSURES OF OXYGEN AND ACETYLENE,
Ibadan Univ. (Nigeria). Dept. of Agronomy.
E. D. Spiff, and C. T. I. Odu.
Journal of General Microbiology, Vol 78, No 2, p 207-209, October 1973. 1 fig, 9 ref.

Descriptors: *Oxygen, *Nitrogen fixing bacteria, *Nitrogen fixation, Soil bacteria, Methodology, Environmental effects, Nitrogen.
Identifiers: *Beijerinckia indicum, *Acetylene reduction, *Acetylene, Partial pressures, Enzyme activity, Substrate utilization, Fate of pollutants, *Bacterial physiology, Flame ionization gas chromatography, Nitrogenases, Ethylene.

Different partial pressures of acetylene and oxygen greatly affect the level of acetylene reduction by Beijerinckia, a nitrogen-fixing bacterium found in some acidic tropical soils. Nitrogenase activity was measured by the acetylene reduction technique using three replicate vials for each treatment. A milliliter-sample of Beijerinckia culture was usually injected to initiate the reaction and the reaction was usually terminated by injecting 5 N H2SO4 into the reaction mixture. The vials were incubated in a 30 C water bath with reciprocal shaking (152 strokes/min). The ethylene produced was measured by flame ionization gas chromatography. Acetylene reduction increased with an increase of pC2H2 up to 0.74 atm. Acetylene reduction was linear for at least 40 min. The oxygen partial pressure also affected activity with most acetylene reduction at a pO2 of 0.15 atm for liquid cultures grown in air. (Holoman-Battelle)

HE EFFECT OF LACK OF A CARBON OURCE ON NITRATE-REDUCTASE ACTIVI-Y IN ASPERGILLUS NIDULANS,
a Trobe Univ., Bundoora (Australia). Dept. of enetics.
. J. Hynes.
ournal of General Microbiology, Vol 79, No 1, p 55-157, November 1973. 1 fig, 10 ref.

escriptors: *Cultures, *Inhibitors, *Carbon, imiting factors, Bioassay, Enzymes, Biochemisy, Fungi.
dentifiers: *Aspergillus nidulans, *Nitrate reducse, *Culture media.

ycelia of Aspergillus nidulans were grown under ducing conditions and then transferred to varius media and incubated further. Samples were arvested at various intervals and assayed to study e effect of carbon starvation on nitrate-reducse activity. Nitrate-reductase activity rapidly sappeared in medium in which further synthesis the enzyme was not possible or in medium cking a carbon source. Absence of inducer and pression by ammonium caused rapid loss of acvity. Cycloheximide, at 10 micrograms/ml, only ightly reduced the rate of enzyme loss and, in ct, cycloheximide itself caused loss of nitrateductase activity. A lower concentration of ycloheximide (1 microgram/ml) has a similar effct. Methylammonium chloride caused rapid loss activity in this strain. An even greater rate of nzyme disappearance was found when mycelium as starved for carbon. An attempt to demonrate in vitro inactivation of nitrate reductase and utamate dehydrogenase by mixing crude myceli extracts and incubating was not successful. owever, this experiment did show that it was unkely that accumulation of an inhibitor of the enymes during carbon starvation could account for e results. Pre-induced beta-galactosidase activity not rapidly lost from carbon-starved mycelium, or does the activity of this enzyme increase in edium lacking a carbon source in the absence of inducer. Therefore it seems that various enymes show different responses to carbon starvaon and different absolute requirements for the esence of inducer. In the case of nitrate reducse there is an absolute requirement for inducer d for the presence of a carbon source. (Littleattelle)

ATURE AND TOXICITY OF TWO OX-CHLORDANE PHOTOISOMERS,
gricultural Research service, College Station, ex. Veterinary Toxicology and Entomology esearch Lab.
. W. Ivie.
ournal of Agricultural and Food Chemistry, Vol , No 6, p 1113-1115, November/December 1973. ig, 1 tab, 18 ref.

escriptors: *Pesticide toxicity, Degradaon(Decomposition), Light.
entifiers: *Oxychlordane, Photodecomposition, *Photoisomers, Chlordane, mple preparation, Photooxidation, Isomers.

mixture of 2.5 mmol each of oxychlordane and nthone in 50 ml of chloroform was streaked over e surface of several 0.25-mm silica gel chroatoplates to a concentration of about 0.2 mg of xychlordane/sq cm. The plates were exposed to rect sunlight for 24 hr over a period of 3 days; en the gel was scraped and the products were extracted with chloroform. Tlc revealed two major photoproducts in addition to the parent compound. These derivatives were methylene-bridged isomers, one containing a keto group generated by photochemical cleavage of the oxychlordane oxirane ring and the other with an intact epoxide moiety. Their information was greatly accelerated by xanthone photosensitizer. Oxychlordane and its keto photoisomer are quite toxic to white mice, but the second isomer is of very low toxicity. (Little-Battelle)

BACTERIA-ASSIMILABLE ORGANIC COMPOUNDS, PHOSPHATE, AND ENHANCED GROWTH OF BACTERIA-ASSOCIATED BLUE-GREEN ALGAE,
Cincinnati Univ., Ohio. Tanners' Council Lab.
W. Lange.
Journal of Phycology, Vol 9, No 4, p 507-509, December 1973. 20 ref.

Descriptors: *Aquatic bacteria, *Aquatic algae, *Eutrophication, *Nutrients, *Algal control, *Water pollution control, Organic compounds, Limiting factors, Plant growth, Plant physiology, Cyanophyta, Nutrient requirements, Phosphorus, Cobalt, Iron, Lake Erie, Water quality control.
Identifiers: *Algal physiology, Organic carbon, Metal chelates, Species interaction, Assimilation.

The complexities of algal physiology and nutrition make it likely that diverse and often substantial nutrient limitation will be required to control eutrophication in different situations. In defense of a policy exemplified by the generalization 'phosphorus is the primary limiting nutrient in most lakes,' Schindler of the Canadian Freshwater Institute has misquoted the work of Lange. Key points of Lange's conclusions are properly quoted, and the reader is cautioned against an oversimplification of a single approach to algal control. (Holoman-Battelle)

EFFECT OF ANHYDROUS AMMONIA ON A CENTRAL TEXAS POND, AND A REVIEW OF PREVIOUS RESEARCH WITH AMMONIA IN FISHERIES MANAGEMENT,
Texas A and M Univ., College Station. Dept. of Biology.
M. A. Champ, J. T. Lock, C. D. Bjork, W. G. Klussmann, and J. D. McCullough, Jr.
Trans Am Fish Soc., Vol 102, No 1, p 73-82, 1973. Illus.
Identifiers: *Ammonia(Anhydrous), Crayfish, *Fisheries management, Frogs, Phytoplankton, Ponds, Reviews, Shrimp, *Texas, Vegetation, Zooplankton.

A pond located on the Texas A and M University range area, College Station, (1.78 surface ha, 40-427 m3) was treated with anhydrous ammonia in Nov. 1968, for evaluation of this technique for simultaneous fish eradication, pond fertilization, and aquatic vegetation control. The effect of such treatment on pond ecology is reported. Chemical, physical, and biological data were taken 1 wk prior to, on the day of, and at selected intervals for 12 mo. following treatment. Ammonia N levels before treatment were 0.2 to 0.4 ppm. The day after treatment the ammonia N level stabilized to 37.7 ppm and gradually declined to 5.0 ppm after 3 mo. The pH before treatment was 6.9. A maximum pH of 10.3 was recorded during treatment and it stayed above 9.0 for 2 wk following treatment. Titratable CO2 decreased as the pH and carbonates increased. Phytoplankton counts were reduced by 96% and zooplankton counts were reduced 99% following treatment. Rooted aquatic vegetation was decimated. Dead frogs and tadpoles were observed. The most adversely affected macroinvertebrates were crayfish and freshwater shrimp. A total fish kill was indicated since no live fish were taken by trawl, or seine, and none were observed after treatment.--Copyright 1973, Biological Abstracts, Inc.

PHARMACODYNAMICS OF METHYL MERCURY IN THE RAINBOW TROUT (SALMO GAIRDNERI): TISSUE UPTAKE, DISTRIBUTION AND EXCRETION,
State Univ. of New York, Buffalo. Dept. of Biochemistry.
F. J. Giblin, and E. J. Massaro.
Toxicol Appl Pharmacol. Vol 24, No 1, p 81-91, 1973. Illus.
Identifiers: *Distribution, Excretion, *Methyl mercury, *Rainbow trout, Salmo-Gairdneri, Scintillation spectrometer, *Absorption, Fish tissue.

The tissue distribution, rate of uptake and concentration of 203 Hg-labeled methyl mercury was investigated in 20 different tissues/organs over a period of 100 days following a single intragastric dose of 0.5 Hg/kg body weight. Mercury content was analyzed by gamma scintillation spectrometry. After 1 hr, mercury concentration factors > 0.1 were detected in the blood, heart, liver, spleen and kidney (a concentration factor (CF) of 1.0 equals mercury concentration in dose). Highest mercury concentrations (CF > 7.0) were observed in the blood (at 7 days) and spleen (at 14 days). After 100 days, the CF of the blood was >2.0 and the CF values of the spleen, Kidney and liver were >1.0. Maximum CF values were reached in the skeletal muscle, brain and lens after 34, 56 and >90 days respectively. Maximum values were reached in most other tissues.organs at approximately 7 days. Skeletal muscle appeared to function as a reservoir for methyl mercury and accumulated 50% of the dose from 34-100 days post administration. Methyl mercury accumulation in the brain was limited to 0.1% of the dose. The rate of mercury excretion appeared to be biphasic as a result of a slow elimination from the skeletal muscle relative to the other tissues/organs. Employing both the slow and fast rate, the half-retention time for methyl mercury in rainbow trout was estimated to be >200 days. The toxicity to humans of methyl mercury present in fish tissues was mentioned.--Copyright 1973, Biological Abstracts, Inc.

5D. Waste Treatment Processes

SANITARY SERVICES IN TENNESSEE, 1972.
Tennessee State Planning Office, Nashville.
Available from the National Technical Information Service as PB-221 531, $7.50 in paper copy, $1.45 in microfiche. Final Report. May 1973. 102 p, 15 tab. HUD CPA-TN-04-33-1006.

Descriptors: *Utilities, *Water supply, *Sewerage, *Waste disposal, *Tennessee, Waste dumps, Rates, Sources of supply(Water), *Treatment facilities.
Identifiers: *Sanitary services inventory.

This tabulation of data on water and sewer systems, and refuse and garbage collection services in Tennessee was compiled by means of mailed questionnaires. Information on those systems which did not respond to the 1972-1973 questionnaire was, where available, repeated from the last report from those systems. Data on water and sewer systems in 279 cities and towns, arranged by population groupings, include information on the water source, daily capacity, the receiving stream (sewer), types of water treatment, types of sewer treatment, sewage output, net monthly rates for residential and non-residential users, the date the rates became effective, the number of customers during the last fiscal year, and gross revenue for that year. Data on 136 utility districts are similarly arranged. Refuse and garbage collection data are provided for 204 cities and towns, also arranged by population groupings. Included are data on the type of service provided, method of disposal, frequency of residential and commercial collection, and charges for residential

and commercial services. (Hoffman-North Carolina)

PRELIMINARY WATER AND SEWER PLAN FOR ALCORN, BENTON, MARSHALL, PRENTISS, TIPPAH, TISHOMINGO COUNTIES.
Northeast Mississippi Planning and Development District, Booneville.
Available from the National Technical Information Service as PB-223 320, $3.00 in paper copy, $1.45 in microfiche. April 1973. 16 p, 6 fig. HUD CPA-MS-04-25-1002.

Descriptors: *Sewerage, *Water supply development, Water wells, *Mississippi, *Water demand, *Projections, *Planning.
Identifiers: Alcorn County(Miss), Benton County(Miss), Marshall County(Miss), Prentiss County(Miss), Tippah County(Miss), Tishomingo County(Miss).

Existing water and sewer systems in the Northeast Mississippi Planning and Development District (NEMPDD) are inventoried. Proposed systems are based upon a preliminary analysis taking into consideration present and future needs, demands and desirability, excluding, however, any evaluation of economic feasibility. A detailed planning study and economic feasibility analysis will follow. Practically every municipality in NEMPDD's jurisdiction needs to expand and improve its existing sewer system. Most municipalities fail to serve the entire population within their corporate limits and even fewer serve the entire limits of the urban area. The preliminary sewer plan also proposes sewage facilities be constructed in the Yellow Creek Industrial Park in Northeast Tishomingo County. Water in NEMPDD's jurisdictional area is of uniformly high quality, and is primarily derived from wells. However, industrial demand for water quality of a higher standard, and a general decrease in recent years in the level of ground water tables, indicate the need for additional treatment facilities. One alternate would be a regional water supply grid system for Alcorn, Prentiss, Tippah, and Tishomingo Counties. A water filter plant on the Yellow Creek embayment of Pickwick Lake would be the primary water source for this system. (Hoffman-North Carolina)

WATER AND WASTEWATER SYSTEMS INVENTORY - REGION H, NORTH CAROLINA,
Pee Dee Council of Governments, Troy, N.C.
N. W. Chesson, and R. M. O'Brien.
Available from the National Technical Information Service as PB-222 565, $4.00 in paper copy, $1.45 in microfiche. July 1973. 32 p, 1 fig. NCP 1006-NM-5.

Descriptors: *Water supply, *Water sources, *Waste water treatment, *Waste water disposal, *North Carolina, Municipal wastes, Waste treatment, Water pollution, Water quality, Sewage effluents, Water treatment, Sewage treatment, Tertiary treatment, Water pollution sources, Water resources development, Water demand, Water policy, Waste disposal, Municipal water.
Identifiers: Anson County(NC), Montgomery County(NC), Moore County(NC), Richmond County(NC), *Regional planning.

Proposed and existing water and wastewater systems in Anson, Montgomery, Moore, and Richmond Counties of North Carolina are described and serve as a base for the regional plan being developed by the Pee Dee Council of Governments. While natural boundaries separate these counties and cause projects to be county-or sub-county-wide, region-wide projects are being studied. Water is abundant in the region, but many sub-areas are remote from the sources. These sub-areas are susceptible to contamination and will be costly in terms of the extent of treatment required; therefore, they are priority areas for water resource planning. Satisfactory wastewater disposal sites are not locally accessible to a large portion of Region H since most streams are too small to accept volume effluent discharges. Wastewater treatment plants must also be capable of tertiary treatment levels, and no plant is presently capable of this level. Regional wastewater systems planning is therefore a high priority. Several older communities must install wastewater facilities to avoid polluting nearby watersheds. Regional outfall and treatment systems should make these installations feasible. Significant development should not be undertaken until water quality determinations are made for that area. (Grden-North Carolina)
W74-07063

WALLOWA LAKE BASIN COMPREHENSIVE PLAN.
Stevens, Thompson and Runyan, Inc., Portland, Oreg.
Available from the National Technical Information Service as PB-224 147, $5.25 in paper copy, $1.45 in microfiche. Prepared for Board of County Commissioners, Wallowa County, Enterprise, Oregon. Comprehensive Plan, 13 p. (uncut) 4 fig, 2 tab and Technical Supplement, May 1973. 33 p, 2 fig, 1 tab, 1 append.

Descriptors: *Water zoning, *Urbanization, *Land use, Lake basins, *Comprehensive planning, Land development, Lake shores, Water distribution(Applied), Sewers, Sewerage, Public utilities, Costs, Lakes, Zoning, Local governments, *Oregon.
Identifiers: *Lake Wallowa(Ore), Joseph(Ore).

A Land Use Plan for long-range development and environmental protection of natural and scenic amenities of the Wallowa Lake Basin in Oregon is presented. The Plan outlines service areas for the provision of public water and sewerage facilities. These services are necessary to public health and safety as well as in preserving the high water quality of Wallowa Lake. Preliminary designs for water and sewer, showing general location and type of facilities necessary and cost estimates are given. Limited development will continue on the south, west, and north sides of the lake. A sewer collection system will serve these areas and will connect to the City of Joseph's system. A separate water system will serve the south and west portion of the lake while an improved Joseph water system will serve the north shore area. In light of the Land Use Plan, recommendations for updating the County Zoning Ordinance are also suggested. These include the addition of zones for rural-residential, open space, resort-residential, and timber; the modification of present C-2 zone which allows for the uncontrolled mix of residential and commercial uses; increasing minimum lot sizes for the agricultural zones; and amendment of the zoning map to conform with the Land Use Plan. (Hoffman-North Carolina)

UTILITIES AND FACILITIES FOR NEW RESIDENTIAL DEVELOPMENT: A SURVEY OF MUNICIPAL POLICY,
Urban Land Inst., Washington, D.C.
J. R. McKeever.
Technical Bulletin No 27, December, 1955. 100 p, 5 tab.

Descriptors: *Planning, *Water supply, *Sewerage, *Financing, *Urbanization, *Land development, *Utilities, Water demand, Surveys, Cities, Sewers, Political aspects, Legal aspects.
Identifiers: Utility extension, Subdivision regulations, Land developers, Questionnaire, Urban growth, Urban counties, Sanitary sewers, Water mains, Municipalities.

Responsibility for utility installation has gradually shifted from the municipality to the land developer in suburban growth. Many local governments cannot cope financially with the necessary expenditures nor can individual homeowners carry the burden of property tax levies. Thus municipalities upgrade their requirements governing the development of land and shift the responsibility. Friction arising between developers and the municipality over the matter of who installs and pays for utilities and facilities comes when developers want to avoid their proper responsibilities, or when approval authorities strive to overreach the extent of their assigned functions. Subdivision regulations must adequately differentiate between improvements required for the immediate project and those needed to serve a territory beyond. Based on this 1955 survey of the responding cities (115 out of 140) having 50,000 or more population, 61% required the developer to pay for all water mains where called for by subdivision regulations, 78% for all sanitary sewers, and 71% for all storm sewers. In 64% of the cities replying, the developer was not reimbursed for any installation costs on these and other utilities such as sidewalks and paving. In 43% of the cities, the city paid the cost of larger water and sewer mains when these were needed to serve development outside the subdivision. In urban counties, the trend is toward requiring the developer to pay for items required to transform raw acreage into finished house sites. (Edwards-North Carolina)

WATER QUALITY MANAGEMENT ELEMENT FOR THE KENTUCKY RIVER AREA DEVELOPMENT DISTRICT COMPREHENSIVE WATER AND SEWER PROGRAM.
Mayes, Sudderth and Etheredge, Inc., Lexington, Ky.
Available from the National Technical Information Service as PB-223 046; $6.75 in paper copy, $1.45 in microfiche. HUD-CPA-KY-04-35-1000.

Descriptors: *Stream pollution, *Water supply, *Water quality control, Waste water(Pollution), Water pollution sources, Sewerage, Coal mines, Mine wastes, *Waste water treatment, Sewage lagoons, Kentucky, Treatment facilities.
Identifiers: *Kentucky River, Kentucky River Area Development District.

The Kentucky River Area Development District contains most of the headwaters of the Kentucky River, one of the principal rivers in Kentucky. Many municipalities, both within and without the District use it as a water supply source. Consequently, pollution of the river is of great concern. There are 3 major sources of pollution in the Kentucky River: coal mining activities, untreated domestic waste, and municipal plant effluents. A major hindrance to the reduction or elimination of the pollution problems has been the lack of water quality data, including knowledge on the exact source of the pollution, the magnitude of the pollution, and mine site locations. A District-wide Authority would be the best vehicle for a coordinated approach to water quality control. The Authority would be responsible for all potable water production facilities and such water distribution facilities that would elect to join the Authority, plus all the sewage treatment facilities in the District and the sewage collection facilities that elect to join the Authority. The need for additional sewage collection and treatment facilities in the individual service areas is set forth. Alternate methods of sewage treatment include the use of tertiary lagoons, where physically possible, and advanced tertiary treatment facilities. (Hoffman-North Carolina)

ATALYTIC OXIDATION OF PHENOL IN ILUTE CONCENTRATION IN AIR,
elaware Univ., Newark. Dept. of Chemical Engineering.
. A. Walsh, and J. R. Katzer.
ndustrial and Engineering Chemistry, Process esign and Development, Vol 12, No 4, p 477-481, 973. 3 fig, 2 tab, and 27 ref. OWRR A-014-EL(6), 14-31-0001-3208, 3508, 3808.

escriptors: *Catalysts, *Phenols, *Oxidation, Kinetics, *Air pollution, Chemical reactions, Industrial wastes, Copper oxide, Waste treatment, Waste water treatment, Order.
lentifiers: *Catalytic oxidation, Vapor-phase oxlation.

he vapor-phase oxidation of phenol at concentraons from 875 to 26 ppm (vol) over copper oxide n alumina was studied in a fixed-bed tubular reacr between 150 and 270 degrees C in the presence f 8.4 to 13.4 mol% water vapor. Catechol, ydroquinone, and organic acids, which are reorted to form in appreciable quantities in the omogeneous oxidation of phenol, are not oberved in the vapor-phase catalytic oxidation. Oranic intermediates, probably o- and p-benzoquine, occur in appreciable quantities in the catalytic xidation at intermediate phenol conversions. At oderate temperatures (250 degrees) and low conersions (30%) approximately one-half of the henol oxidized is converted completely to CO2 nd H2O. This indicates that ring opening is a relavely difficult step in the reaction network. The apor-phase oxidation is first order with respect to henol over the range of conditions studied and xhibits an Arrhenius activation energy of 10 cal/mol.

CID NEUTRALIZATION DOESN'T COST IUCH,
falconbridge Nickel Mines Ltd., Toronto Ontario); and Acres Consulting Services, Ltd., oronto (Ontario).
. S. Rivett, and U. M. Oko.
Vater and Waste Engineering, p B12-B16, March 973. 4 tab.

Descriptors: *Waste water treatment, *Mine wastes, *Neutralization, Acid mine water, Capital costs, Operating costs, Limestones, Sulfur compounds, Sulfides, Heavy metals, Settling basins.
Identifiers: Mine tailings.

A major pollution problem associated with the mining and treatment of sulphide ores is the formulation of acids. The Falconbridge Nickel Mines, Ontario, has developed an effective program to neutralize acid and improve processing water quality at a modest investment and low operating costs. The initial problem arises when water comes in contact with the sulphide mineral pyrrhotite in processing causing small amounts of sulphur to dissolve forming a compound which eventually would oxidize into sulphuric acid. In developing its Strathcona mine and concentrator, the company faced two problems. The only available water source was inadequate; in addition Moose Lake water was already acidic, a result of earlier concentration operations. The solution was to utilize part of the lake both as a reservoir and an oxidizing basin. A dam and spillway were constructed to allow introduction of a continuous stream of finely ground limestone to neutralize acidity. The operation operates continuously and automatically producing a satisfactorily stream of good quality neutral water. Annual operating expenses average about $27,000, including $15,000 for limestone, $2,000 for power. Estimated cost of the plant, excluding building and dam costs, was 0.7 cents per 1000 gallons of water treated as compared to the over 10 cents treatment costs in much of North America. (Schroeder-Wisconsin)

COSTS OF WASTEWATER RENOVATION,
National Environmental Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
R. Smith.
Available from the National Technical Information Service as PB231805, in $3.00 paper copy, $1.45 in microfiche. November 1971. 7 fig, 4 tab, 6 ref.

Descriptors: *Water treatment, *Water costs, *Water reuse, *Waste water treatment, Water supply, Design, Water distribution(Applied), Distillation, Demineralization, Reverse osmosis, Irrigation water, Industrial water, Potable water, Denitrification, Capital costs, Operating costs, Maintenance costs.

The economic feasibility of using renovated waste water to supplement raw water sources is examined. The first element considered is the total cost of water supplies from traditional sources. Operating, maintenance and capital costs are estimated to provide 1, 10, and 100 mgd supply requirements. Waste treatment costs are estimated to handle the discharge of waste water back into the environment. Operating and capital costs are also estimated for various waste water renovation processes to supply 1, 10, and 100 mgd requirements. The cost of such treatment is dependent on the uses to which the water will be applied. For example, some agricultural uses may be able to use secondary effluent. In general, waste water renovation may represent higher costs than water from normal sources. Waste water renovation, however, compares favorably with the development of new sources of raw water. Costs of these new sources are estimated under the Texas Water Plan, for the Metropolitan Water District of California, and for the City of Los Angeles. (Schroeder-Wisconsin)

WATER TREATMENT APPARATUS,
A. Wikey.
U.S. Patent No. 3,769,196, 3 p, 5 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 915, No 5, p 1841, October 30, 1973.

Descriptors: *Patents, *Aeration, *Sterilization, *Electrolysis, *Pollution abatement, *Waste water treatment, Biochemical oxygen demand, Bacteria, Equipment, Water pollution treatment, Industrial wastes.

An electrolysis unit uniquely suited for treating water by sterilization and aeration, comprises at least one pair of electrodes placed in juxtaposed position and being oppositely polarized. The polarization is periodically reversed to prevent residual build up on the plates. By simple modifications and by increasing the number of electrodes the unit may be used to treat water in flowing streams, lakes, ponds, aquariums, beach sections, in private homes, or in industrial plants. (Sinha - OEIS)
W74-07196

PROCESS OF SEPARATION OF EMULSIFIED OR DISPERSED MATTER FROM WATER,
E. H. Baer.
U.S. Patent No 3, 769,207, 3 p, 8 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 915, No 5, p 1843, October 30, 1973.

Descriptors: *Patents, *Waste water treatment, *Flotation, Sludges, Pollution abatement, Water pollution control, Water quality control, Equipment, Facilities, Emulsions, Suspended solids, Separation techniques.
Identifiers: Suction jets.

A chamber is adapted for flotation of impurities and production of floating sludge on and above the surface of the water within the chamber. A knife edge is situated above the water level, and parallel to it. The knife edge is adapted to sever that part of the floating sludge which extends above the water surface. A movable suction jet situated above the knife, moves in unison with the knife edge and pneumatically removes the severed sludge without disturbing the water surface. (Sinha - OEIS)
W74-07197

PLASTIC MOVING-SURFACE TREATMENT OF SEWAGE,
Biospherics, Inc., Rockville, Md. (assignee).
G. V. Levin.
U.S. Patent No 3,779,906, 5 p, 1 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 917, No 3, p 1086, December 18, 1973.

Descriptors: *Patents, *Sewage treatment, *Activated sludge, *Microorganisms, Pollution abatement, Water pollution control, Water quality control, Phosphates, Nutrients, Organic matter, Polymers, Plastics, *Waste water treatment.

Influent sewage is mixed with activated sludge providing a mixed liquor which is aerated in the presence of a quantity of particles of synthetic plastic. The added surface attracts microorganisms and the nutrients and organic matter necessary for their growth. The mixture is settled and subsequently the clarified liquid is removed while part of the sludge is recirculated along with the plastic particles. The plastic particles range in size from 0.05 to 1.0 mm in diameter and have a specific gravity ranging from about 0.9 to 1.3. Before recycling the sludge it may be passed to a phosphate-stripping zone. The microorganisms in the sludge release phosphate thus providing a phosphate enriched supernatant liquor. (Sinha - OEIS)
W74-07198

METHOD OF AND APPARATUS FOR THE PURIFICATION OF WATER CONTAINING ORGANIC CONTAMINANTS,
Laboratorium fuer Adsorptionstechnik, G.m.b.H., Frankfurt am Main (West Germany). (assignee).
W. Wisfeld, H. Wirth, W. Lotz, and A. Kratz.
U.S. Patent No 3,779,909, 5 p, 2 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 917, no 3, p 1086, December 18, 1973.

Descriptors: *Waste water treatment, *Patents, *Water purification, *Oxygenation, *Filtration, *Chlorination, Water treatment, Water quality control, Activated carbon, Equipment.

Ground or surface water containing unwanted organic matter is fed into a trickle tower. After being subjected to an oxygen containing gas stream, it is passed through an activated carbon filter system. The effluent is then treated with at least 0.05 mg/liter of chlorine or with an equivalent disinfectant. (Sinha - OEIS)
W74-07199

FLUOROCARBON AND OXYGEN-PROVIDING COMPOUND TREATMENT OF WASTE WATERS,
M. G. Hicks.
U.S. Patent No 3,781,200, 3 p, 4 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 917, No 4, p 1415, December 25, 1973.

Descriptors: *Patents, *Waste water treatment, Oxygenation, Pollution abatement, Water quality control, Water pollution treatment, Solvents, Ozone, Bubbles.
Identifiers: *Fluorocarbon, *Fat, *Freon, Oxygen compounds.

Heavy Freon is used as a solvent to remove fat from waste water. Freon is mixed with at least one oxygen containing compound selected from the group hydrogen peroxide, ozone, oxygen and air. The mixture is delivered into the wastewater and oxygen is diffused upward through the water in the form of bubles. The Freon containing the fat is continuously drawn off and taken to the next stage where the fat and Freon are separated so that the Freon can be used again. (Sinha - OEIS)
W74-07200

APN ARATUS FOR SEPARATING OIL AND SOLIDSFFRM M WATER,
Black, Sivalls and Bryson, Inc., Oklahoma City, Okla. (Assignee)
F. J. Barra, and K. R. Murrell.
U.S. Patent No 3,784,010, 5 p, 3 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 918, No 2, p 679, January 8, 1974.

Descriptors: *Patents, *Filtration, *Waste water treatment, *Oil pollution, *Suspended solids, Pollution abatement, Water pollution control, Water quality control, *Separation techniques, Equipment.

A closed vessel is divided by a vertical partition. A second vertical partition is disposed within the lower portion of the first compartment dividing it into two separate filter areas each having a filter bed. An inlet water conduit extends within the first compartment and a pair of slotted water distribution conduits are positioned horizontally with the filter area. The conduits are connected to the inlet water conduit. Filtered water outlets are disposed in the bottom part of the second compartment. A backwash pump is connected to the conduit and valves control the flow of filtered water from the first to the second compartment. Backwash water flows from the second compartment separately to the filter area of the first compartment, through the filter beds and out of the first compartment by way of the slotted inlet water distribution conduits. (Sinha - OEIS)
W74-07202

SYSTEM AND METHOD FOR SEPARATING HEAVIER AND LIGHTER COMPONENTS OF LIQUID MIXTURES,
Esso Production Research Co., Houston, Tex. (assignee).
J. A. Garcia.
U.S. Patent No 3,784,468, 2 p, 4 fig, 1 ref; Official Gazette of the United States Patent Office, Vol 918, No 2, p 790, January 8, 1974.

Descriptors: *Patents, *Flotation, Gases, *Aeration, *Oil pollution, *Waste water treatment, Pollution abatement, Water quality control, Water pollution control, Cyclones, *Separation techniques, Equipment
Identifiers: *Gravity separation

The method and system for separating the components of a liquid mixture in which cyclones are used to force gas into the mixture for the purpose of aiding in floating the lighter component in a specially provided flotation cell or series of flotation cells is disclosed. The misture of liquids (oil and water) is delivered by conduit to a cyclone by means of a pump. The bottom of the cyclone is positioned in the gas environment. The vortex formed in the center of the cyclone sucks gas up to mix with the swirling liquid under pressure. The rising gas floats oil and possibly light solids to the surface of the liquid. The floated oil and solids overflow into a trough and are led away through a duct. The heavier liquid is pumped through a conduit into another cyclone where the mixing and charging with gas is repeated. (Sinha - OEIS)
W74-07203

WATER PURIFICATION APPARATUS,
Walter Dorwin Teague Associates, New York. (assignee).
J. E. Ryan, and S. Gollin.
U.S. Patent No 3,785,490, 3 p, 2 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 918, No 3, p 1056, January 15, 1974.

Descriptors: *Patents, *Waste water treatment, Pollution abatement, *Aeration, *Froth flotation, *Water purification, *Suspended solids, Water pollution control, Water quality control, Equipment.

A pump is used to deliver influent from a storage reservoir into a froth flotation tank. The pump is subject to intermittent air-binding thereby introducing air into the influent prior to its delivery to the froth flotation tank. The reservoir receives influent at a substantially constant rate lower than the pump capacity so that the pump has a tendency to intermittently air-bind. This results in a large amount of extremely fine air bubbles being introduced into the influent to cause the formation of a froth which rises to the surface carrying with it suspended solids. (Sinha - OEIS)
W74-07209

WATER PURIFICATION SYSTEM,
Delro, Inc., New Castle, Del. Assignee.
L. E. Huffman.
U.S. Patent No 3,786,924, 6 p, 1 fig, 8 ref; Official Gazette of the United State Patent Office, Vol 918, No 4, p 1438, January 22, 1974.

Descriptors: *Patents, *Waste water treatment, *Water quality control, *Water purification, *Reverse osmosis, Membranes.

A water purification system consists of a reverse osmosis unit having a feed water inlet, a permeate outlet, and a membrane structure between the feed water inlet and the permeate outlet. The reverse osmosis unit also has a concentrate outlet upstream from the membrane structure in fluid communication with the feed water inlet. There is a conduit for delivering raw water from a supply source to the feed water inlet, and a pump in the conduit for establishing a pressure responsive device for activating and deactivating the pump in response to preselected levels of vessel pressure. (Sinha-OEIS)
W74-07213

FOAM FLOTATION CONCENTRATION OF SEWAGE,
FMC Corp., San Jose, Calif. Assignee.
E. H. Brink, and W. G. Palmer.
U S Patent No 3,787,316, 6 p, 7 fig, 5 ref, Offici Gazette of the United States Patent Office, V 918, No 4, p 1535, January 22, 1974

Descriptors *Patents, *Sewage treatment, *Was water treatment, *Aeration, *Activated sludg *Flotation, *Anaerobic digestion, Water quali control, Water pollution control, Bubbles, Foa ing.

Raw sewage is subjected to primary settling, aer tion and secondary settling to produce activate sludge. Part of the activated sludge from second ry settling is returned for aeration and part wasted Sludge from primary settling is delivere to an anaerobic digester. The wasted activate sludge is concentrated and a partially clarified ef fluent is derived from it. The concentrated was sludge is introduced into the anaerobic digeste The innovation comprises the steps of diffusing water foam of surfactant-stabilized air bubble into the wasted activated sludge before the latte enters the concentrator The wasted activate sludge is concentrated by the lifting action of th air bubbles to form a blanket. The blanket is the skimmed off for delivery to the digester. (Sinha OEIS)
W74-07214

WASTE WATER PROCESS TANK CONTRO FACILITY,
Carter (Ralph B.) Co., Hackensack, N. J. As signee.
W. O. Boschen, and O. A. Grieshaber.
U.S. Patent No 3,788,472, 4 p, 1 fig, 4 ref; Offici Gazette of the United States Patent Office, Vo 918, No 5, p 1847, January 29, 1974.

Descriptors: *Patents, *Waste water treatment *Pollution, abatement, Water pollution control Water quality control, Sensors, Equipment *Control systems.

The invention comprises a control box containing a control system having suitable relays and othe elements and a panel with indicators mounted thereon which may be located in the control box o removed thereform. Suitable sensors are located in critical portions of the system and the sensors are electrically connected to the control box to actuate indicators which are mounted on the pane and to aid in the localizing of trouble and the correcting of such trouble. Some of the sensors may also function as control devices and/or indicators during normal (nonmalfunction) operation. The control system shuts operation down on malfunction and controls the operation of the treatment system in its normal (automatic) condition or in a temporary condition after malfunction. (Sinha-OEIS)
W74-07216

SEWAGE TREATMENT SYSTEM,
D. F. Othmer.
U. S. Patent No 3,788,476, 8 p, 9 ref; Official Gazette of the United States Patent Office, Vol 918, No 5, p 1848, January 29, 1974.

Descriptors: *Patents, *Sewage treatment, *Wastewater treatment, *Oxygenation, Sedimentation, Pollution abatement, Water pollution control, Water quality control, Chemical reactions, Aerobic treatment, Atmospheric pressure, Sludge, *Solids contact processes.

A conventional solids-liquid contactor clarifier with some additions provides means for: (a) addition of air or purer oxygen to sewage waters; (b) pressurizing the sewage water up to 10 atmospheres to increase solubility and concentration of oxygen - hence velocity of chemical and/or aerobic reaction; (c) withdrawing and depressurizing the sewage water to atmospheric pressure to allow most of dissolved gases to be released and to be discharged because of lower solubility for gases at atmospheric pressure; (d) recycling the sewage

water for from 2 to 50 times through this pressurizing-depressurizing cycle; and, when used aboard ship, (e) means for installation in the ship's hold to minimize effects of the ship's movements on the sedimentation operation. It is particularly useful for smaller installations, for use on ships, and other places where waste from not more than several thousand people is to be handled. It also may be used as a sedimentation system alone wherein insoluble solids are settled out to give a clear effluent. The sludge solids produced in an earlier sedimentation, either with or without oxidation, may be oxidized and sedimented in a separate step in the equipment. (Sinha-OEIS)
W74-07217

TREATMENT APPARATUS,
L. S. Love.
U. S. Patent No 3,788,477, 8 p, 22 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 918, No 5, p 1849, January 29, 1974.

Descriptors: *Patents, *Aeration, *Waste water treatment, Pollution abatement, Water pollution control, Water quality control, Equipment, Sludge.
Identifiers: *Clarifiers.

An aeration or mixing basin and a clarifier are formed as one integral unit, separated by a baffle. Flow from the aeration basin into the clarifier is limited by flow control plates. The clarifier has a bottom which slopes toward the aeration basin bottom, so that solids settling in the clarifier flow down the clarifier bottom towards the aeration basin, where they are picked up by circulation in the earation basin and re-suspended. A sludge scraper scrapes the clarifier bottom periodically to dislodge sludge to the bottom, and a scum skimmer skims the clarifier surface periodically to remove scum. (Sinha-OEIS)
W74-07218

WASTE WATER TREATMENT,
Shell Oil Co., New York. Assignee.
W. E. Savage.
U. S. Patent No 3,788,478, 3 p, 2 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 918, No 5, p 1849, January 29, 1974.

Descriptors: *Patents, *Waste water treatment, *Froth flotation, Pollution abatement, Water pollution control, Water quality control, *Aeration, Equipment, Bacteria, Activated sludge, *Biological treatment.

The apparatus for biologically treating aqueous organically contaminated waste consists of an aeration basin in which an open-topped flotation cell is submerged. Separation of the bacterial suspension and recovery of clarified effluent takes place within the aeration zone. The froth formed in the flotation unit is immediately emitted into the surrounding bacterial suspension. As the bubbles of the froth rise, they carry the suspended particles of activated sludge upward for removal. (Sinha-OEIS)
W74-07219

AGITATING AND AERATING APPARATUS,
Xodar Corp., Warwick, R. I. Assignee.
R. L. Clough, Jr.
U. S. Patent No 3,788,616, 7 p, 8 fig, 1 ref; Official Gazette of the United States Patent Office, Vol 918, No 5, p 1885, January 29, 1974.

Descriptors: *Patents, *Waste water treatment, *Aeration, *Pollution abatement, Water pollution control, Water quality control, Equipment.
